FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

TELL THE TRUTH, DON'T SAVE FACE

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 2-6

[Speech on 9 May 1945 by Chen Yun]

[Text] CCP Central Committee party literature research office's note: "Tell the Truth, Don't Save Face" is a part of a speech Comrade Chen Yun made at the seventh CCP national congress in 1945. It vividly and profoundly explains how to treat merits and mistakes from the historical materialist point of view and asks our cadres, especially leading cadres, to tell the truth and not to save face. The principles Comrade Chen elaborated in his speech should be studied well and understood today by all comrades of our party at a time when the party's fine traditions have been seriously damaged after 10 years of turmoil under the rule of the Lin Biao-Jiang Qing counterrevolutionary clique.

Recently, the party Central Committee asked us to bravely take up the weapon of criticism and self-criticism and cleanse ourselves of political dust and microorganisms. It also asked leading members of party organizations at all levels in particular to make preparations for conducting "correct and serious criticism and self-criticism without distorting facts," earnestly improve the style of party leadership, improve collective leadership by party committees at all levels, enhance unity both within and outside the party and give effective leadership to all fields of work. The study of Comrade Chen Yun's speech is of great importance in implementing the guidelines and meeting the requirements set by the party Central Committee.

Pursuant to the instructions of the Secretariat of the party Central Committee and with the approval of Comrade Chen Yun, this speech is now published for the study of party members and cadres.

If a comrade asks me: You have been head of the organizational department for several years, do you have something to say? I would say that I have, now that I am relinquishing this job for Comrade Peng Zhen to take over. If he asks me: What do you have to say? My answer is: I have already made clear in Comrade Shaoqi's office as to how many party members, cadres, statistical tables and pamphlets we have. Now I do not want to say more about that but I would like to speak about something else. I feel that I have the responsibility to speak to you at this congress about what I have seen. You, comrades, can study and decide if I am right and criticize and refute me if I am wrong. In the past 7 years I have found a number of party cadres arrogant. During this period I did not make contact in my work with large numbers of cadres. I have not been to north China, central China and the area under Kuomintang rule during the war of resistance against Japan. But many people have come to Yanan from these places to "make a pilgrimage." From my contact with these people, I have found that many people like praise and dislike criticism. Some people only want to be promoted, but not demoted. When they make a contribution, they are sure to claim credit for themselves. When they make a mistake, they always try to shirk their responsibility. When they are criticized for their mistakes, they give a lot of reasons to prove they are not at fault. They feel comfortable when praised, and uncomfortable when criticized. This is a tendency existing among a number of cadres within our party. Let me define more clearly what I have said. Our party cadres on the whole are good. They are basically Bolsheviks, with some defects. With regard to the condition I just described, there is some difference between the period before and after the rectification of incorrect work style. There has been a great improvement following the rectification. But the condition still exists among a number of our cadres. The rectification has touched only a number of cadres. Here I want to add that the number of cadres unmoved by the rectification is quite large, not just a few. They include those in the local areas and those in the army. From what I see, the army has more of such people than the local areas. This is my own view. Cadres who are arrogant include low-ranking cadres, middle-ranking cadres and high-ranking cadres as well as the big shot [datouzi 1129 7333 1311]. The nature of individualism of low-ranking cadres is the same as that of high-ranking cadres, but the "burdens," in my opinion, are different. This is because the "burden" of individualism carried by low-ranking cadres is limited. For instance, a company leader will carry on his back a bed sheet, two pairs of shoes, a box of tooth powder and a toothbrush. That is all. The burden is uncomfortable, but not as uncomfortable as that of high-ranking cadres, big shots, party and army chiefs who have more baggage, such as bed sheets, cotton-padded mattress and blankets. Thus a high-ranking cadre with such a tendency is more dangerous than a middle- or low-ranking cadre because of the difference in "burden." The "burden" I have just mentioned refers to individualism in the mind of a communist. Why should one feel arrogant? Well, there is a basis for arrogance. The person is aware of his contributions. If he discovers that he has made no contribution, what can he feel arrogant about? Arrogance comes when a person feels that he has made some contributions.

Incidently, I would, therefore, like to discuss my views on contributions and mistakes. If you have performed certain work under party leadership and have thus accomplished something, what will be your view of your accomplishment? I would say that three factors should be noted: first, the strength of the people; second, leadership by the party; and third, the personal role. Can this order be reversed so that personal role comes first, party leadership second and the strength of the people third? I say no. This order must never be reversed. You will ask, why not? Why should the people's strength come first? It is wrong to think that if one does not take part in the revolution, the common people can never be emancipated, the CCP will be at its wits' end and the masses will find themselves at a disastrous impasse. When a hero dies, will the revolution come to a halt? Will the people no longer wage revolution? The common people still want to wage revolution and the party continues to advance. Therefore, the people, not the heroes, come first and the party comes second. One must give full weight to the role of the party. Take the army for instance. Our army sometimes loses battles, but it will not collapse. One should have some personal experience in this and believe not his ears but his eyes. During the Long March, the Fifth Army Corps fought every day for a period of 100 days while on a forced march. It seemed that this corps could not fight any longer. Marching forward with torches in their hands, the soldiers' morale was low. However, everyone would have thrown away their torches and continued fighting to resist the enemy if the superiors had decided to continue the battle. Soldiers taken prisoners by the enemy managed to escape and returned to their parent units one after the other. Things were very difficult during the Long March, but no one wanted to leave; they stayed with us because the army was an army led by the Communist Party. It is easy to lead this army; but in another sense, it is difficult to do so. The fact that everyone wants to wage revolution and accepts no mandatory orders makes it very difficult to lead the army; yet, the fact that everyone is conscious of what he is doing and works hard for conscience sake makes it easy to exercise leadership over the army. In other armies, if a company leader, a regimental commander or a division commander changes sides, he can take his unit with him. But our army is different. If a leader or a commander is a turncoat, the men will refuse to go with him and will kill him. There have been many examples of this in the past and at present. What strength is behind these examples? This is the party's strength. The Communist Party is welcomed by the people wherever it goes. The common people first ask if you are a member of the Eighth Route Army or not? Why should they ask? It is because the common people support the Communist Party. Because they are poor, they want to be emancipated, to strike blows at the local tyrants and share their land, to "share" something. They agree with the Communist Party. This shows the party's strength, not the strength of the individual. This indicates the party's influence. Our Communist Party has had its low and high points. During the late years of the civil war, we were welcomed by the common people even though we pursued an erroneous line. I do not say this for the purpose of defending the mistakes made in those years. What I say is a fact. The common people did not accuse you of following a dogmatic line. They only knew that you were communists and that the Communist Party wanted to overthrow the local tyrants, to share their land and to work for the people's interest. All this shows that our party's strength is powerful. Therefore, the people come first, the party second and the personal role comes last.

Does the individual play a role? I would be wrong if I negated the individual's role. If the role of the individual means nothing, why should we support Chairman Mao? I say the individual plays a role and sometimes a big role. My word here is based on facts. People, whether they are Chinese or foreigners, with the exception of a tiny number of reactionaries, all say that Chairman Mao's leadership is fine. However, the most essential thing is the common people, the Communist Party. When a person acknowledges that this is true, has worked for a period of time and his work is not bad, can he say "I have made a great contribution"? No, this is not appropriate. The question should be viewed this way: In line with the revolutionary requirements of the people and with the party's leadership, we have worked in conformity with the objective situation and have not made many mistakes. Our work is just so-so. It is very rare that objective conditions allow a person to accomplish his work fully. It is common that when objective conditions permit a person to accomplish 100 percent of his work, he has performed only 80 percent, 60 percent, or 50 percent because of his shortcomings. Then, what can one feel arrogant about? Another situation is this: When objective conditions are so good that they permit a person to accomplish 100 percent of his work, he has accomplished nothing because of his mistakes or he has performed only 20 percent or 10 percent because of his many shortcomings. He has not made a single contribution but has committed numerous mistakes because 80 percent or 90 percent of what he has done was wrong. In this case, he must not feel proud of what he has done. Is this view correct? I say it is correct. We should not overestimate our own role and feel so self-important.

If other comrades respect and praise you for your good work, you should be on guard. Do not feel complacent when people praise you or you will trip and fall. When is a person apt to trip and fall? We had this experience when we were proceeding on foot during the Long March, that is, we were constantly wary of tripping and falling. If you thought you had never tripped and fallen during the march, then you were likely to trip and fall soon. Therefore, you should be on guard when people praise you. Think for yourself whether you are that good. Maybe you are not that good and you should be on guard. The CCP has so many examples of this. Those who believed that their personal contribution was beyond that of the people and the party have fallen and never risen again. I find the most outstanding examples in two persons--Chen Duxiu and Zhang Guotao. In the past, that old fogey Chen was a VIP, being publicly recognized as the party's leader during the great revolution. Zhang Guotao, or Chairman Zhang, was the chairman in the border region. But when he abandoned the common people and the party, he was not worth a coin.[1] During the Qing dynasty, a ma [7802] money was used, which was subsequently replaced by copper coins. Was he worth a copper? No. What are they up to now? Chen Duxiu is dead. He organized liquidationists to oppose us, but the people did not support him. Was the later Chen Duxiu the same as the earlier Chen Duxiu? The later Chen Duxiu was indeed the Chen Duxiu of the great revolution. They were actually one and the same man. At first, the people supported him as leader, but they eventually ignored him. Zhang Guotao, formerly Chairman Zhang, is now engaged in secret service. Does he have supporters? Only Generalissimo Chiang supports him. The common people do not support him. Did he have a large mountain stronghold in the beginning? The Fourth Front Army was sizable, but he was alone when he left. All the cadres stayed away from him and his guards also returned to Yanan. He was alone when he left amid the drizzling rain of the Qingming season. We can draw a lesson from these things. A person has his contributions, but he should not overestimate them. He who abandons the people and the party will achieve nothing. This is how we should measure ourselves. From where do your merits derive? For one thing, the common people want revolution. We, the party members, have merely done something under the party's leadership to meet the people's demand. That's it. In no way should we feel complacent.

Regarding the question of making mistakes, I have the feeling that besides an incorrect stand and a vicious motive, there are other things which trip up a person. Because of a misperception of the objective things, the resulting actions also go wrong. There were many instances of this in the past and there are many at present. We wonder how many more such instances will occur in the future. When people say, "Hey, you are wrong," should we blush and feel offended? Of course it is not good to make mistakes, but it does not matter if you have a correct attitude. If you make a mistake and others criticize you, you should ask for their advice, learn how they analyze the mistake, and then correct it. In this way you will make fewer mistakes in the future. We must tell the truth, not save face. We should evaluate things as they are and do what needs to be done. Sometimes, the more you save face for the moment, the more you lose it in the future. Only when you are not afraid of losing face, cast aside all considerations of pride and sincerely correct your mistake can you keep some face. A Communist Party member who takes part in the revolution has given up everything and is ready to sacrifice his life for the revolution. So why should he be concerned about face? Cast aside such considerations, tell the truth, and do whatever is beneficial for the people and to the revolution. We are shouldering such a heavy burden and if we want to save face, we will not be objective when discussing things and will look at things from a certain angle, that is, we will tend to support the opinions that are beneficial to us and to our faces and disapprove of those that do not consider our faces. If you want to save face, you will view things from the angle of personal interest when discussing questions and take a wrong stand. You will not see problems clearly or tell the truth. The results are bound to bring harm both to other persons and to yourself. For instance, the enemy is powerful. However if we misjudge it and think it is weak, then we are defeated. Defeat is the result. This not only happened in the past, but will also happen frequently in the future. No one is an exception.

Why do I spend so much time on this question at the meeting of the seventh national CCP congress? I feel I have the responsibility. Having been the director of the CCP Central Committee's Organization Department for 7 years and being aware of this question, I need to talk about it at the meeting. I hope delegates to the congress will examine and verify the matter to see if it is correct and determine which part is correct, which part is wrong and whether it is all correct or all wrong. Anything wrong with it can be refuted. If this situation really exists, I hope everyone will make corrections in this respect. Now is an opportune time, a very important opportunity. Chairman Mao's report says that according to the general situation in the world and China, we are on the eve of a final battle. We have the ambition to liberate the whole of China and arouse the people of all of China to stand up and to hold the political power in their hands. This should be done immediately. The seventh national CCP congress is precisely designed to accomplish tasks like this. Now the whole party's task is to increase its strength and there are many ways to do this: by either expanding the liberated areas or by shrinking the enemy-held areas. I personally feel that we should increase and decrease at the same time. By increase, I mean we should study. By decrease, I mean we should unload the "burden," which is also a way to increase strength. The strength increased in this way is inestimable. If all our comrades are upright, seek truth from facts and are devoid of individualism, they can withstand an army of 100,000 or 1 million. This is an invincible power.

Comrades, the CCP is a party with its own army. In making revolution, we have local civilian work and military work to do. At present, army work and armed struggle are the major work. The army holds the guns. Its organization is more centralized. Its cadres hold great responsibilities and its ranking cadres hold even greater responsibilities. Can the 450 million people achieve liberation? Will liberation be achieved early or late? Will some 100,000 less people be sacrificed or some 100,000 more? The people throughout the country place their hope on our party and on our ranking cadres. If we do our work well, victory will come and the people will be liberated soon. If we do not do our work well, the 450 million people will not be quickly liberated, victory in the revolution will be delayed for years and many more people will be sacrificed. Then, we will be letting the people down. Our party has to decide the destiny of the people throughout China. Communist Party members, it is the people who have chosen you to be their representatives in waging revolution. It is the people who want you to lead them in the struggle for emancipation. We have this duty. We cannot afford to fail in our work. Failure in our work is not just the matter of one person or a few people. The success or failure of the 450 million people throughout China is at stake. We must be conscientious. We should cast away all that is bad and everything that should be cast away. We should shoulder our responsibilities in front of the people. Failing to do so means failing to fulfill our duty. People say that CCP members are outstanding descendants of the Chinese nation. Whether we are outstanding or unworthy descendants can be judged by whether we have fulfilled our duty for the people. This duty has been given to us. We should conscientiously handle this question. I repeat: Our comrades are basically Bolshevik and are good Communist Party members. What I was talking about was some drawbacks among the good. Some cadres have these drawbacks. Now, it is time to correct these drawbacks. During the civil war period, a book entitled "Struggle To Make the CCP More Bolshevik"[2] was published. That was not good. We must discard our "burden," truly struggle to become Bolshevik and increase the strength of ourselves and the party.

FOOTNOTES

1. Zhang Guotao was acting chairman of the Shaanxi-Gansu-Ningxia border region government from September 1937 to April 1938. On the Qingming

tomb-sweeping day in April 1938, representing the Shaanxi-Gansu-Ningxia border region government, Zhang Guotao held a memorial ceremony at the Huang emperor mausoleum and took this as an opportunity to escape to Wuhan to join the Kuomintang secret service group, thereby becoming a renegade of the Chinese revolution. So, later on in the passage it was said that "he was all alone when he left amid the drizzling rain of the Qingming season."

2. This refers to a booklet by Wang Ming published in 1931 representing the left-deviationist dogmatism.

KEEP THE OVERALL SITUATION IN MIND AND GIVE METICULOUS GUIDANCE

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 7-10

[Article by RED FLAG Editorial Department]

[Text] Filled with a feeling of joy, all of us are now ringing out the year 1981 and ringing in the year 1982.

How was our work in 1981, now that we are reviewing it? If we do not have any prejudices, we cannot but admit that the whole party, including all localities, nationalities, trades and professions and fronts, made new contributions and scored major new achievements in our work. What were the principal signs of these major new achievements? First was the continued turn for the better in the economic situation and second was the greater stability in the political situation. The continued turn for the better in the economy refers not only to the fact that we have overcome serious natural disasters, that our production has increased by a considerable margin and that there has also been very great improvement in our financial status while great readjustment of the national economy is being carried out; but, what is more important, it refers to the fact that we have systematized a set of correct principles for the guiding ideology of the socialist economic construction, that is, the 10 principles put forth by Comrade Zhao Ziyang in his report to the 4th Session of the 5th NPC. The latter achievement is, in a certain sense, greater than the former one. It is precisely this set of principles that has enabled our national economy to embark on the path of steady development. It is also precisely this set of principles that will ensure that we do not take the tortuous path of muddling things up in the future, but take the new path with substantial speed, better economic effect and more practical benefits for the people. This is the experience we have gained after spending many years and paying great sacrifices. Politically, we have maintained and developed in the past year the political situation characterized by stability, unity, vividness and liveliness. It can be said that the political situation in our party and state at present is the best since the 1960's. In this aspect, the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC" approved at the 6th Plenary Session of the 11th CCP Central Committee has played a positive role in unifying the ideology of the whole party, the whole army and the people of all nationalities throughout the country, strengthening unity, enhancing revolutionary vigor and building a powerful and modern socialist country with one heart and one mind. This role has exceeded the expectation of a great many comrades and is showing itself ever more clearly.

The achievement in the past year has not been gained easily. This is the result achieved by the whole party, the whole army and the people of all nationalities throughout the country with concerted and strenuous efforts under the guidance of the principles and policies of the CCP Central Committee. We should fully understand that the entire situation is getting better and better with each passing year and that the party's prestige is rising continuously. More and more people at home and abroad believe that our party has the ability and means to administer our country well and to achieve the objectives of our struggle for this century. We should have the confidence in ourselves and the steadfastness of the proletariat. The view that the prestige of our party appears to be dropping continuously does not conform to reality. Comrade Mao Zedong often quoted Lenin as saying that, in order not to make others vacillate, one should first of all not vacillate oneself. We should always remember this sentence.

Naturally, we should also understand that the people set very high demands on us and expect us to do more and better. As a matter of fact, some of our work has not been done well and a lot of problems have not been solved well. We should never overlook the problems in this aspect. What are our conclusions then? The conclusions are: do not be satisfied with the achievements made, and do not slacken our efforts but continue to go all out, forge ahead and strive to achieve the objectives of our struggle in the new year.

The year 1982 is the sixth year since we smashed the "gang of four," the fourth year since the 3d Plenary Session of the 11th CCP Central Committee was convened and the first year since we accomplished the historical task of bringing order out of chaos in the guiding ideology of our party. That is to say, the party will have many more favorable conditions in 1982 for concentrating its energy on leading socialist modernization better. Therefore, it is entirely justifiable to ask the whole party to do its work better in various fields so as to obtain better results in the new year and to win still greater victories in socialist modernization.

In order to win still greater victories in socialist modernization in 1982, what are the targets and the requirements?

First, it is necessary to simultaneously grasp the building of material civilization on the one hand and the building of spiritual civilization on the other. Relatively satisfactory results should be achieved in these two aspects. The slogan that "life under socialism must attain a high ethical and cultural level" has been recorded in the "resolutions" of the 6th Plenary Session of the 11th CCP Central Committee. This is a very good slogan and has a very strong appeal to the people of the whole country. It can play a very good role in mobilizing the people politically and exert very good influence internationally. The bourgeoisie has always accused us of paying no attention to civilization in building communism. We declare that socialist spiritual civilization is 10,000 times better than your civilization!

Second, it is necessary to develop the economy vigorously, steadily and speedily. The advantage of this formulation is that it contains both given quantitative requirements and strict qualitative ones and unifies the two aspects. Stress should be laid on steadiness, and it is necessary to do away with falsity. This means that close attention should be paid to improving economic results. This makes it necessary for us to conscientiously carry out the 10 principles for economic construction and solve a series of major problems in a planned way. Every sphere, including agricultural and industrial production, communications and transportation, capital construction, circulation of commodities and finance and banking, should do its work in a down-to-earth manner so as to raise economic results. We should fully understand the significance of improving economic results as the heart of economic construction. First of all, it is necessary to soberly understand that our economy has shown very great improvement since the great readjustment of the national economy, but the potential danger has not been completely eliminated. The task of stabilizing the economy, of achieving a near balance in financial revenue and expenditure and the basic stability of prices, remains a matter of the first magnitude that merits our close attention. Second, it is necessary to understand this truth, that is, whether we engage in construction or increase the income of the workers and peasants, the money comes, in the final analysis, from industry. Ninety percent of our state financial revenue is provided by industry. Only by improving the economic results of industry, which means that we have not only developed production but also increased our income, do we have money to engage in construction and improve the people's lives. Furthermore, it is also necessary to understand that in order to improve the economic results, it is imperative to have a firm grasp of the readjustment and restructuring of enterprises. The potential of our enterprises is very big. So long as we carry out technological transformation, gradually institute and amplify the economic responsibility systems, strictly enforce the various necessary rules and regulations, train the ranks of staff and workers well, reorganize the leading bodies, practice democratic management, raise the level of management, step up ideological and political work, overcome lax discipline, poorer quality, serious waste and other phenomena and crack down on the evil tendencies such as deception, tax evasion, graft, bribery, withholding profit that should be delivered to the state and overcharging the state, shall we be able to achieve the aim of improving economic results and further stabilizing the economy. Moreover, it is necessary to further make clear the guiding ideology for rural work. In order to stabilize the economy and enable the national economy to embark on a new path, we should rely not only on industry but also on agriculture. It is necessary to educate the peasants in collectivism and patriotism. They should be made to understand that it is imperative for China to take the road of socialist collectivization in agriculture; that it is imperative to uphold the long-term unchanged policy of public ownership for land and other basic means of production and the long-term unchanged policy of practicing the production responsibility systems in the light of the requirements of the collective economy; that it is imperative to uphold the principle of "never slackening our efforts in grain production and actively developing the diversified economy"; and that it is imperative to uphold the principle of giving consideration to the interests of the state, the collective and the individual. On the basis of raising the peasants' consciousness, it is necessary to gradually perfect the agricultural production responsibility systems and set up a rational agricultural production structure characterized by diversified economy, comprehensive development, good economic effect and a high commodity rate. Finally, it is necessary to profoundly understand this major principle: in the economic construction of our country, we must coordinate the activities of the nation like pieces in a chess game and act according to plans. Ours is a great socialist country with 1 billion people, 800 million of whom are peasants. In all the economic activities, stress should be laid on the planned economy supplemented by regulation by market mechanism. In our country, the relationship between the planned economy and regulation by market mechanism is one between the principal and the subordinate aspects. Our economic work should be aimed by providing 1 billion people with rice and enabling our country to have the surplus strength to carry on with the construction. The improvement of the people's lives should be kept within the framework that they can eat and engage in construction. The consumption of the people should be arranged according to plans for we should not pay attention to eating alone. There would be no prospects for our country if we should eat or use up everything. The construction of our country should also be carried out according to plans in order of priority and importance; we should not upset the balance among finance, credit and goods. It is also necessary to strengthen guidance of the agricultural economy and allow the peasants to operate within the scope of the state plans. Only by doing so can we conform to the overall, long-term and fundamental interests of the people and the state.

Third, in carrying out political work and building spiritual civilization, we must strive to make definite improvements in social order, social morality and party work style. In areas inhabited by minority nationalities, we should also strive for great improvements in the relationship and unity among nationalities. In order to accomplish these three tasks, it is necessary to adopt a series of practical and effective measures.

First, it is necessary to mobilize the whole party and all social forces and to arouse all media and mass organizations to create strong and persistent public opinion for building socialist spiritual civilization. Otherwise, it is impossible to build socialist spiritual civilization. We were very good at creating public opinion during the war of resistance against Japan. In implementing the three main rules of discipline and the eight points for attention, the people's army was also very good at creating public opinion. In December 1980 Comrade Deng Xiaoping proposed that, in achieving the four modernizations, it is necessary to vigorously promote the spirit gained during the revolutionary war years. He said: "We should also spread this spirit among the entire people and youths by giving it great publicity and setting an example, so that it will become the main pillar of spiritual civilization of the PRC, cherished by all people in the world who demand revolution and progress and admired by many people in the world who lack spiritual ballast and suffer spiritual depression." It seems now that the matter has not aroused the close attention of the people and has not been given "great publicity." "Great publicity" refers to creating public opinion. It is necessary to create powerful and sustained public opinion to foster the healthy tendencies and suppress the unhealthy ones. The methods of piecemeal, weak and feeble publicity will not achieve the desired results. In brief, in building a high degree of spiritual civilization for our nation, it is necessary to conduct extensive, thoroughgoing and sustained education among the whole party, the whole army and the people of all nationalities throughout the country. It is necessary to pay attention to this matter for many years and make it known to every household.

Second, all party and government organizations, armed forces units, enterprises, schools and mass organizations, totaling more than 100 million members, should take the lead in talking about civility, courtesy, sanitation, order and morality, stressing beauty of the mind, language, behavior and environment, planting trees to make the motherland green, beautifying the environment, and carrying out sanitation work and other socialist activities for the benefit of the public. The 4th Session of the 5th NPC has approved a resolution on launching a voluntary tree planting movement by the whole people. We should promote these activities in a sustained and thoroughgoing way and not carry them out on and off or in a feeble manner. This is also a movement for changing prevailing habits and customs and transforming China. The significance of this matter should not be underestimated. There are 1 billion people in China and if we first pay attention to these movements in a persistent manner among the 100 million people, the prevailing customs of the entire society will change accordingly.

Third, it is necessary to effectively reorganize the grassroots organizations in the cities and the countryside and to improve the ideological and political work of party organizations and the government work in the grassroots. This is a very important matter. Take the rural areas for example. After the practice of various forms of the production responsibility system and especially in localities where the system of assigning farm output quotas for each household and assigning each household full responsibilities for task completion has been practiced, it is necessary to pay close attention to avoid or rectify the breakdown or disintegration of the grassroots organizations. As an economic unit, the function of the production brigade and the production team in leading the economy should be preserved; the function of commune (township) and production brigade (village) as basic-level government in particular should be correspondingly strengthened. Otherwise, the various kinds of confusion in the rural areas will unavoidably spread. At present, in some localities of the rural areas, public security is poor, the general mood of society is unhealthy and gambling and superstitious practices are rampant. An important reason for the emergence of these phenomena lies in the fact that the party and government organizations in the grassroots are not sound. It is therefore necessary to reorganize the basic-level organizations so that the ideological and political work of the grassroots party organizations and the government work at the grassroots can be genuinely strengthened.

Fourth, it is necessary to continuously strengthen the work of party discipline inspection committees and the administrative and judicial departments, to earnestly solve the unsettled problems regarding the implementation of the party's policies, and to resolutely and promptly hit at all violations of law and discipline and criminal activities. The leading comrades of the

CCP Central Committee recently pointed out that a few units and cadres continued to engage in smuggling activities and the activities of selling smuggled goods and that the fact that some localities had failed so far to deal with the matter gave us much food for thought. With respect to matters of this kind, it is necessary to investigate them thoroughly and mete out stricter and heavier punishment if an important person or a big organization is involved. From this we can see that, with respect to the serious matters of violating law and discipline within the party, if we fail to resolutely and mercilessly investigate and affix responsibility for them, it will be impossible to rectify the party work style. In order to improve the general mood of society, it is first of all necessary to rectify the party work style. An extremely important aspect in building spiritual civilization is to use the party work style to promote the common practice of the people.

Fifth, it is necessary to transform the superstructure in a planned and systematic way, to simplify the administrative structure, to vigorously overcome bureaucratism and to greatly increase efficiency. The malpractice of bureaucratism that exists in the political life and economic management of our state has become a serious obstacle in our efforts to advance along the new path for developing the national economy and to engage in the building of the four modernizations. After meticulous investigation and repeated studies, the CCP Central Committee and the State Council are determined to adopt decisive measures to resolutely change the intolerable states of affairs, such as great numbers of departments, overstaffed organizations, complicated administrative structure, petty disputes, having more hands than needed, excessive number of deputies and nominal positions and low work efficiency. The central organizations and the State Council will set an example for the party and government organizations at various levels throughout the country by putting them into practice first. The measures will then be spread from one level to another and be accomplished by stages and in groups within the specified time. Without grasping the link of simplifying administrative structures and without starting with this work, it would be impossible to overcome bureaucratism.

Building socialist spiritual civilization is a long-term and tremendous strategic task which requires us to do a lot of work. It is necessary to start our work by paying attention to social order and the general mood of social and party work style--particularly party work style. This is a major task the whole party should pay close attention to.

Now, the correct line and principles have been laid down and the targets of our struggle have been ascertained. It is necessary to let all our party members fully understand the significance of achieving new major successes in our work in 1982. We can take a still firmer stand if we make new and greater progress in economic and political work and in building material and spiritual civilization in 1982. Then, the path will be smoother for us to advance from this year to the next, march onward toward the goals of the "sixth 5-year plan" and subsequently open up a new period of economic prosperity. At the same time, it goes without saying that this will also be of great significance in promoting the return of Taiwan to the motherland and the handling of international affairs. In brief, what should be done since the fighting tasks for this year are so heavy and there is so much work to be done? First, it is necessary to enhance revolutionary vigor and second, to pay attention to methods of work. In a word, with respect to the work for this year, the whole party, first of all the leading organs and leading comrades at various levels, are expected to accomplish the following requirements: keep the overall situation in mind and give meticulous guidance. It is necessary to uphold the four basic principles and overcome the state of laxity and weakness in the work of leadership.

THE WHOLE PARTY MUST STUDY MARXISM

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 11-12

[Article by Song Renqiong [1345 0117 4522]]

[Text] Since the day of its founding more than 60 years ago, our party has always relied on the conscientious study of Marxism and adhered to the integration of the universal truth of Marxism-Leninism with the concrete practice of the Chinese revolution to save the revolution from danger and disaster. This has enabled the revolution to turn from defeat to triumph and to advance from triumph to still greater triumph. At present, as the party in power of such a great oriental country as China with its long history, complicated conditions and formerly very backward economy and culture, our party shoulders the magnificent task of leading 1 billion people of various nationalities in realizing socialist modernization. The government work report recently adopted by the 4th Session of the 5th NPC has pointed out that in order to fulfill this task and build a high degree of socialist material civilization as well as socialist spiritual civilization, we must genuinely proceed from actual conditions in China and break a new path that will be more realistic in speed and that will produce better economic results and provide more material benefit for the people. To this end, the conscientious study of Marxism-Leninism-Mao Zedong Thought should occupy an extremely important position among the comrades of the whole party.

Since the 3d Plenary Session of the 11th CCP Central Committee, our party has, on the basis of practical examination, correctly summed up the experiences of the past and corrected the leftist mistakes in guiding ideology. This has enabled a great improvement to take place in the level of Marxism of the whole party. Only as a result of integrating with the concrete practice of China's socialist construction can the universal truth of Marxism-Leninism increasingly demonstrate its immense vitality and can achievements be made in various kinds of work. The present problem is, some of our party members and cadres and even some of the comrades in charge of leadership work have not paid enough attention to the study of Marxism. Consequently, when confronted with the new conditions and new problems which constantly appear, they do not know what to do and cannot apply the correct stand, viewpoint and method to observe and solve the various complicated contradictions. They are unable to link up the actual conditions of their own locality and department to comprehensively understand and consciously implement the policies and principles of the party. They have no knowledge of the true state of affairs and are always vacillating. They stick to their own views and engage in endless arguments. The advance of history and the development of causes are so fast that if we deviate only slightly from Marxism, the discussion of emancipating the mind, exploring new paths and successfully carrying out various tasks would be out of the question and we would be lagging further and further behind the trend of the times. All party members and cadres, and above all the leadership cadres, must fully understand that only by conscientiously studying Marxism can they shoulder the important historical task and can they be worthy of the great trust of the people. On such a serious and important question as this, they cannot be the least bit sluggish or careless.

As the nature of the work and the responsibility shouldered by every comrade are not the same, there should also be particular emphasis on the content of study. I advocate that everybody should study a bit of philosophy, political economy, scientific socialism and history. At present, we must pay special attention to integrating the study of the resolution adopted by the 6th Plenary Session of the 11th CCP Central Committee with the economic expositions of Comrade Chen Yun and the 10 major principles for economic construction proposed by Comrade Zhao Ziyang. Study does not mean memorizing by rote. We must above all correctly understand the stand, viewpoint and method, restore and carry forward the good style of study of integrating theory with practice and apply the Marxist stand, viewpoint and method to analyze and solve actual problems in our work. We have often said in the past that we must study Marxism. However, because we sometimes did not integrate that with the practice of our revolution and construction, we have turned the lively theory into a rigid dogma and made serious mistakes. Wang Ming's dogmatism caused great damage to the cause of the Chinese revolution. In the Yanan rectification campaign which began in 1942, the whole party applied Marxist theory to sum up historical experiences, criticized dogmatism and unified thinking. This guaranteed the success of the war of resistance against Japan and the war of liberation. After 1957, because of the misunderstanding and dogmatic interpretation of certain ideas and theses in the works of Marx, Engels, Lenin and Stalin, and because we were not good at applying and developing Marxism in accordance with the already changed social condition, we also made mistakes in our work. After the smashing of the Jiang Qing counterrevolutionary clique, the erroneous "two-whatever's" policy still appeared among some of the comrades. From the 3d Plenary Session to the 6th Plenary Session of the 11th CCP Central Committee, as a result of the application of Marxism-Leninism-Mao Zedong Thought in bringing order out of chaos, carrying on the revolutionary cause and forging ahead into the future, our party has restored and formulated a series of correct principles and policies ideologically, politically and organizationally as well as in various fields of socialist construction, basically reversed the erroneous leftist orientation, produced the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC" and enabled the principle of integrating theory with practice to emit greater radiance.

In the study of theory in the future, we must on the one hand continue to guard against and oppose dogmatism, and on the other hand, we must also guard against the tendency of opposing and despising the study of theory. Both these tendencies are subjectivism and a sign of ossification of thinking. Unless these obstacles are swept away, it is impossible to integrate theory with practice. In the past, by relying on the guidance of Marxism-Leninism-Mao Zedong Thought, our party obtained a victory in revolution and construction. At present and in the future, we must also rely on this heirloom to create new achievements. The great cause of 1 billion people building a strong and modern socialist country will constantly spur the Chinese communists to draw strength from Marxism-Leninism-Mao Zedong Thought, more closely integrate the basic principles of Marxism-Leninism with the concrete practice of modernization and enrich and develop Mao Zedong Thought. We hope that all the comrades in the party will attach great importance to the study of theory, seriously read books, and courageously practice and dedicate themselves to the cause of socialist modernization.

THE KEY TO BUILDING THE TWO CIVILIZATIONS

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 13-14

[Article by Zhao Shouyi [6392 1343 0001]]

[Text] Our party is now going all out to undertake two things of great importance: one is to build socialist material civilization and the other is to build socialist spiritual civilization. This is our strategic thinking and two goals of struggle which are inseparable and complement each other. All our departments and work must be centered closely on and must serve these two great goals, and we must struggle for the realization of these two great goals.

To realize these two great goals requires many conditions, of which one exceedingly important condition concerns cadres. Our cadres at various levels are the pioneers of the vast masses on all fronts, and they are of vital importance in uniting and leading the masses in fulfilling the various tasks put forth by the party and the state. Stalin said that if we could train all cadres of the various departments into fairly mature Marxist-Leninists and help them to be able to solve the problem of state leadership without making serious mistakes, we would have the basis for solving all our problems. Therefore, the constant enhancement of the Marxist theoretical level and professional knowledge of our cadre ranks is a question of utmost importance in the building of socialist material civilization and spiritual civilization.

Our party has always attached great importance to the Marxist theoretical study and education of the cadres. The party's historical experience has shown that when cadres study well and the party's work style is good, our cause advances and triumphs; when cadres do not satisfactorily study and the party work style is unhealthy, our work requires strenuous efforts and even suffers setbacks. The Yanan rectification movement in 1942 and 1943 was a widespread and profound Marxist education movement. Through the rectification movement, the level of Marxism of the whole party was raised and an important ideological foundation was laid for seizing victory in the war of resistance against Japan and the war of liberation. In the early 1950's, the broad masses of cadres studied the history of social development, grasped the basic viewpoints of historical materialism, conscientiously remolded their ideology, fostered the revolutionary world outlook, preserved and developed the traditions of wholeheartedly serving the people, thus resulting in a more practical work style, fairly reliable implementation of the policies, and comparatively close relations between the cadres and the masses. Precisely because of this, in the first 7 years after the founding of the PRC, remarkable achievements were made in various work, the socialist transformation was completed smoothly, industrial and agricultural production expanded at rapid rates, the people were happy and fully confident in the future of socialism, and the general mood and outlook of the society was completely improved. Thus it can be seen that the cadres' doing a good job in studying and enhancing their theoretical levels of Marxism and professional knowledge have always been the key in the success or failure of our cause.

We are now in a great historical period, a period in which we are pushing our cause forward and forging ahead. The 6th Plenary Session of the 11th CCP Central Committee marked the completion of the historical mission of bringing order out of chaos in the party's guiding ideology, but the work to correct "leftist" mistakes in our work has not yet come to an end. There still exists a bourgeois liberalization trend in the society, and this also affects the party. The influence of feudal ideology and small-producer mentality is still widespread. There are some erroneous concepts and confused ideas concerning the four basic principles and also, in varying degrees, the party's principles and policies among some cadres and masses. The work to bring order out of chaos in theory and to conduct ideological education is still fairly arduous. Furthermore, the historical mission to build socialist material civilization and spiritual civilization has posed many new problems which we must study, analyze and solve by using Marxism-Leninism-Mao Zedong Thought. Therefore, to strengthen the cadres' theoretical study is of special significance at present.

The building of socialist material and spiritual civilization is not separated from the guidance provided by Marxist theory. To modernize industry, agriculture, national defense, and science and technology, it is necessary to use Marxism-Leninism-Mao Zedong Thought to study China's national condition and formulate correct principles and policies in accordance with the objective laws of the development of things. To build a socialist spiritual civilization, it is most necessary to strengthen the ideological education in Marxism. The term socialist spiritual civilization not only refers to education, science and education but also to communist thought, ideals, beliefs, moral concepts, discipline, revolutionary stand and principles, a comradely relationship among people, and so on and so forth. Socialist spiritual civilization is, up to now, the highest stage of the development of spiritual achievements of mankind. The core of socialist civilization is the communist spirit, which is a fundamental indication of differentiating socialist spiritual civilization from the spiritual civilization of the past historical stages and other societies. Besides, communism is the Marxist ideological system. Therefore, using Marxism-Leninism-Mao Zedong Thought to educate people is the central issue in building socialist spiritual civilization.

Marxism holds that the working class will not spontaneously produce a socialist consciousness. Ideological consciousness will not automatically improve simply because production is expanded. Marxism is the most advanced scientific ideological system based on the whole cultural knowledge of mankind. It should be instilled into people's minds. This means that using Marxism to educate people is a long-term and arduous task. In the past, we relied on the propagation of Marxism in inspiring, educating and organizing the masses and won victory in seizing political power. Now to build the two civilizations, it is necessary to do this instilling work. At present, first of all, it is imperative to help the 20 million cadres throughout the nation, and in particular the leading cadres at various levels, receive a relatively full education in Marxism. By intellectual investment, we mean first and foremost making investment in the cadre ranks and conscientiously promoting cadre restudy and reeducation. Only when they are helped to base their world outlook on Marxism, to acquire the spirit of self-devotion to realize the ideal of communism, to set high aims and lofty aspirations, to work hard for the prosperity of the country and transform China, and to have the correct ideological line of seeking truth from facts, can they lead by example and teach the people throughout the country to foster communist thoughts, ideals, beliefs and moral concepts and habits, and to go all out with one heart and one mind to struggle for the construction of the two civilizations.

Owing to the damage caused by Lin Biao and the "gang of four," the party's tradition of attaching importance to theoretical study was suspended for a fairly long time. During the "Great Cultural Revolution," sham Marxist and anti-Marxist absurdities were in vogue, ideological confusion prevailed, and the demarcation line between right and wrong was obscured. Large numbers of new cadres lack an education in basic Marxist knowledge, and the theoretical quality of the entire cadre ranks is far from suiting the requirements of the present situation. Since the 3d Plenary Session of the 11th CCP Central Committee, the Marxist ideological line has regained its ruling position throughout the party. The state of affairs has begun to turn for the better. However, the problem in which some cadres look down on and even detest and reject theoretical studies has not been completely solved. By either using the pretext of being busy in routine duties or being content with simply reading documents and materials and even regarding economic construction as a matter of practice, some cadres refuse to study Marxism. Being mentally active, some comrades dare to dig into problems but because of not being well prepared in terms of basic Marxist theory and of failing to profoundly experience and observe the history of the Chinese revolution and the reality of Chinese society, they are apt to be influenced by the erroneous trends of thought and to go astray ideologically. Facts have proved that only by closely integrating with practice and enhancing education in basic Marxist theories, can we heighten our consciousness, achieve unity of thinking and unify the understanding of the vast numbers of cadres on the line, principles and policies formulated since the 3d Plenary Session of the 11th CCP Central Committee so as to better lead the masses in building the two civilizations.

In terms of cadre's theoretical study, we have experiences both positive and negative which we must sum up in an earnest way and, especially, we must make a serious study and draw up a plan in the light of the new situation. For some time in the past, it was true that we did not get a good grip on theoretical study, particularly in the case of in-service cadres. In reality, the absolute majority of cadres are at their own posts and those cadres who can leave their jobs temporarily to study in party schools are limited in number. Genuinely to enhance the political and ideological consciousness of cadres, improve work style and work methods, and raise work efficiency, it is essential to devote much time and energy to promoting study by cadres.

At present, the cultural and theoretical levels of cadres are uneven. In the light of the experience gained in the early postliberation days in dividing cadres into advanced, middle and primary study groups and in proceeding from the existing foundation of the cadres, it is advisable to exercise specific and systematic guidance for them. The contents and requirements of study should vary, and uniformity must not be imposed. The ways and means must also be diverse and varied. According to content variety, running short-term study classes, evening party schools and television universities is encouraged. In short, it is necessary to adopt measures which are welcomed by the cadres and to encourage all of them to study more and better. It is imperative to strengthen the tutorial aids to help cadres in their study. The CCP committees of various provinces, municipalities and autonomous regions are encouraged to run publications to provide guidance to cadres in their theoretical study. Localities which have the necessary conditions are urged to set up a contingent of full-time or part-time teachers and instructors in political theory. Cadres who study hard and make marked achievements should be commended and encouraged, and the cadres' study and results of study must be taken as one of the bases for testing and promoting cadres. In sum, herculean and effectual efforts should be made to make the cadres' theoretical study a success. If this is done well, we will be able to substantially raise the theoretical level of the whole party and promote the building of socialist material civilization and spiritual civilization.

STUDY ECONOMIC THEORY IN THE LIGHT OF THE 10 PRINCIPLES

Beijing RED FLAG in Chinese No 1, 1 Jan 82 p 15

[Article by Commentator]

[Text] The government work report delivered by Comrade Zhao Ziyang at the 4th Session of the 5th NPC correctly analyzed the economic situation in our country, pointed out the prospects for our development and emphatically expounded the 10 principles for economic construction. These principles should be utilized in blazing a new trail for developing our economy at a more realistic speed and with better economic results, and for achieving more material benefits for the people. They are clear, abundant in content and have not only provided us with a definite work program in our socialist economic construction but also with important material for our study of economic theory. The study of the government work report and the study of economic theory can be and must be closely related.

The core of these 10 principles is achieving better economic results. This is the prerequisite for achieving more material benefits for the people as well as the key to ensuring the continued development of the national economy. It must be considered the basic starting point for all our economic activities. Needless to say, in the study of economic theory, we must firmly grasp this core. Why is it that many of our important indexes, which reflect economic results, are lower than those of the developed countries at present, and even lower than the historical record levels of our country? Why have things remained unchanged in many places and units in spite of the great efforts for years, and why has the development of production and improvement of people's livelihood not conformed with the efforts the people have made? What should we do to effectively straighten out our guiding ideology, to master economic laws, to improve our work and produce as much material wealth as possible with the least possible consumption of manpower and materials and financial resources? These questions require our careful consideration, profound analysis and further exploration in the light of our practice. The theme of achieving better economic results in all links of production, construction and circulation runs through the Marxist theory of reproduction and Comrade Chen Yun's economic works. Therefore, only by focusing on this aspect in studying economic laws and summing up experiences and lessons can we really make our study effective.

The 10 principles have concretized the policy of readjusting, restructuring, reorganizing and upgrading, which has been proved to be effective in practice since the third plenary session. They are, in reality, a systematic explanation and a scientific confirmation of the eight-character policy. The study of economic theory in the light of the 10 principles will deepen our understanding of this theory and will help us realistically sum up experiences and lessons in our work and in our localities and departments. Thus, a more solid ideological foundation will be laid for further implementing the party's eight-character policy.

The 10 principles embody the basic spirit of proceeding from China's realities in our socialist economic construction and establishing a new road to modernization suitable for our conditions, which was put forth in the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC." The "resolution" pointed out: "The prolonged 'leftist' mistakes we made in our economic work in the past consisted chiefly of departing from China's realities, trying to exceed our actual capabilities and ignoring both the economic returns of construction and management as well as the scientific confirmation of our economic plans, policies and measures, with their concomitants of colossal waste and losses." The aim of our study of economic theory is the mastery of economic knowledge and economic laws, and in the final analysis, is the establishment of a road of socialist construction suitable for China's realities and with a Chinese style. Proceeding from this, the 10 principles made a feasible change in the long-standing past practices, which were the result of the "leftist" ideology, and paved a new road for our economic development. Studying economic theory in the light of the 10 principles will deepen our understanding of China's realities and the law of our socialist economic construction, as well as our understanding of Marxist economic theory. Since the 10 principles for economic construction involve a number of economic problems, as well as economic and natural laws, they will give great impetus to our theoretical study, as our cadres, especially those in the economic departments, will have to study economic theory well. Many comrades have already realized this and a new campaign for studying theory has emerged in many places. We are sure that this campaign will develop vigorously, for it is a requirement of our socialist modernization and the demand of our times.

CSO: 4004/21

HOW SHOULD WE LOOK AT THE STUDY OF ECONOMIC THEORY AT PRESENT?

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 16-17

[Article by Su Xing [5685 2502]]

[Text] Since 1981, vast numbers of cadres, using Comrade Chen Yun's economic works as a basis, have been seriously studying socialist economic theory. As far as I know, many units, especially units engaged in financial and economic work, are very enthusiastic about the study and have learned a lot from it.

In the 1950's cadres also engaged in a large-scale study of economic theory. At that time, they mainly studied basic theoretical knowledge and tried to understand through the study the historical inevitability of socialism replacing capitalism and the socialist economic laws. This was in order to raise their consciousness in carrying out socialist transformation and planned economic construction. The study at that time left a very deep impression on us. Even now, whenever we talk about theoretical study, we always think that we learned the most at that time.

At present, we are carrying out our study under new historical conditions, which are quite different from those in the 1950's. Nevertheless, the urgency of our study is not less than that in those days. First, our country's socialist construction has traversed a course of nearly 30 years and has gained rich experiences. Some of these experiences are positive while others are negative. Yet they all need digesting and summing up. In the course of digesting and summing up these experiences, we can find the objective, and not fabricated, intrinsic laws and use them as the guide for our action. Second, after 1958, the leftist errors in the guiding ideology for economic work became more and more serious. Although corrections had been made from time to time, the problem was not thoroughly solved either in theory or in practice until the 3d Plenary Session of the 11th CCP Central Committee. It often happened that, at times, some tentative ideas in the works of Marx, Engels, Lenin and Stalin were misinterpreted or dogmatized in order to provide "theoretical bases" for the leftist errors. During the "Great Cultural Revolution," Lin Biao and the "gang of four" made use of this for sabotage activities and caused great confusion in theoretical work. Such confusion needs clarifying through theoretical study and through the work of bringing order out of chaos. Third, since the focus of our work was shifted to building socialist modernization at the 3d Plenary Session of the 11th CCP Central Committee, new situations and new problems have emerged one after another in the course of readjustment and restructuring. A good command of theory is also needed to study these new situations and new problems. Therefore, everybody needs to study economic theory.

Compared with the study in the 1950's, there is another difference in the current study. A number of cadres have already acquired knowledge of the basic theory of political economics through various study channels and they need not start from the very beginning (those without such knowledge must of course learn the basic theory first). This will help them better integrate theory with reality and better understand the laws of our country's economic construction through summing up experiences. Understanding economic laws does not merely mean memorizing a few formulas or learning some concepts by heart. More important is to study the forms of socialist economic laws manifested under our country's concrete conditions and to study how to determine policies and principles. In view of these requirements, nothing is more suitable than taking Comrade Chen Yun's economic works as the major topic for our study.

Comrade Chen Yun's economic works were not written as theoretical works. He proceeded from the reality of our country's socialist construction and put forth a series of views and suggestions in the light of issues affecting the overall situation. However, what he put forth is theory. For example: the planned economy is the main body and free production under the guidance of planning is the supplement; planned socialist economy means proper proportion; the scale of capital construction must be appropriate to the capabilities of financial and material resources; the increase in the people's purchasing power must be appropriate to the amount of consumer materials available; financial income and expenditure must be proportional to credit income and expenditure, and the former must be slightly more than the latter; annual plans must be made in such a way that they dovetail with those before and after them; and so on. All these are important theoretical matters and are applications and developments of basic Marxist principles on reproduction in the practice of our country's socialist construction. Therefore, we should never regard these works simply as articles or reports for solving problems in practical work but must study them in the way we study theory. During the Yanan rectification campaign, Comrade Mao Zedong explained what is meant by theory. He said, "There is only one kind of true theory in this world, theory that is drawn from objective reality and then verified by objective reality; nothing else is worthy of us calling it theory." I hold that Comrade Chen Yun's works are exactly this kind of theory.

Most of the works we are studying at present were written by Comrade Chen Yun at the end of the 1950's or at the beginning of the 1960's. After studying them, can we use them to solve economic problems in the 1980's? The answer is yes. First, the readjustment of the national economy which we are carrying out at present is, as far as its content is concerned, basically the same as that at the beginning of the 1960's. The views and suggestions put forth by Comrade Chen Yun in the light of the conditions at that time are also suited to the present situation. Second, since these views and suggestions are in conformity with objective laws, they can be used not only within a short period but also within a relatively long period. This means that we not only can use them today but also can continuously derive ideological strength from these works in building socialist modernization in the future. Finally, the scientific attitude and dialectical methods which Comrade Chen Yun persistently upheld are universally applicable in all our work, particularly in economic work, and they should all the more be seriously studied. Ideologically speaking, the reason why we suffered repeated setbacks in economic construction in the past is that we committed the mistakes of subjectivism, impetuosity and rashness and ran counter to the scientific attitude of seeking truth from facts and to the dialectic method. We should always bear this lesson in mind.

In studying economic theory, we should take Comrade Chen Yun's works as a basis. At the same time, we should also integrate the study of the 10 principles for economic construction put forth by Comrade Zhao Ziyang in the government work report he delivered at the 4th Session of the 5th NPC. We can also read some books on economics. For example, the book entitled "Studies on Problems of the Chinese Socialist Economy," written by Comrade Xue Muqiao, proceeds from our country's reality and probes into socialist economic laws. It can help us achieve a deeper understanding of Comrade Chen Yun's works. If possible, we can also read "Study Marx' Theory on Reproduction."

Not only should cadres engaged in financial and economic work study economic theory. Cadres doing other work should also study it, because the building of socialist modernizations will still be the focus of our work for a relatively long time to come. Economic construction is closely related to various trades and professions and is also related to individual life. If we do not learn a little economic theory, we will not be able to coordinate our work with the central task. During the revolutionary war period, nearly all cadres were concerned with and studied military affairs and almost everybody read Comrade Mao Zedong's military works because fighting was the central task in those days. At present, all trades and professions should be concerned with the economy as they were concerned with military affairs in the past. They should study a little economic theory according to their own conditions. This will be conducive to our making concerted efforts in satisfactorily building socialist modernization.

PUT AN END TO THE PRACTICE OF ALLOWING THEORETICAL STUDY TO TAKE ITS NATURAL COURSE

Beijing RED FLAG in Chinese No 1, 1 Jan 82 p 18

["Readers" forum article by Li Biyan [2621 4310 3508]]

[Text] To my knowledge, the practice of allowing theoretical study to take its natural course and to run slackly is prevalent among the incumbent cadres of some units. The main manifestations are as follows:

Lacking a study plan. On their own whim, some cadres choose to study something for a time and drop it at another time when their whim passes. They do not have a plan in mind about what to study. They study things that suit their taste but ignore things which are not to their taste. When their seniors come to inspect them, they convene an "emergency assembly" and fetch some documents, newspapers and magazines to study for the moment.

Lacking a theme for discussion. Very often, they spend much time studying their work and discussing their daily routine, without a central theme. Sometimes, because of digression, they cannot hit the "right path" even though they have a central subject.

Having an unsound system which nobody follows. During the study period, you turn up when he does not, or when he shows up, I do not. A member will decide at will on the number of days for study in a month, and on whether to conduct individual or collective study. And such a practice is called "flexibility."

Cadres' progress is not checked. Few people bother to know which comrades perform well and which do not. Nor do they bother to find out how they have studied or how much each of them has learned.

Why is there such a phenomenon? The reasons are complicated. However, the main reason is that our comrades' awareness of the importance of theoretical study varies. The reputation of theory was discredited by Lin Biao and the "gang of four" and has not been rehabilitated. For instance, some comrades still maintain that one cannot produce food or cotton only by theoretical study. What they mean is that theory cannot solve practical problems; "distant water cannot quench present thirst." Some comrades believe that theoretical study is the responsibility of the upper-level departments and the leading cadres, and that the lower-level departments are responsible for execution, not for theoretical study. Such blurred understanding has stifled, to various degrees, the zeal for and the interest in theoretical study. In particular, a few leading cadres often make leadership over daily routine diametrically opposed to leadership over theoretical study. They maintain that "the sky will not fall" even if theoretical study is "slowed down or put off for a while." They regard theoretical study as "a flexible assignment for a flexible target," and do not put it in the place it deserves. The practice of allowing theoretical study to take its natural course is extremely out of step with the construction work facing our party. We should not allow it to continue. Thus we suggest:

1. Promptly compile "a handbook for cadres," a textbook of political theory.

2. Establish a sound system of study. To ensure that theoretical study can be carried out normally, a discipline of study and a system of attendance checking, examination, awards and penalties should be established.

3. Enhance study efficiency by improving study methods. To set up junior, intermediate and senior classes for cadres in accordance with their levels of theoretical education, so that theoretical study suiting individual cadres can be organized.

4. Strengthen the ideology, organization and work of the teams of theoretical education, so that they can play a significant role in theoretical study.

5. Party organizations at all levels should earnestly strengthen the leadership over theoretical work. And this is the key. Comrades holding leading positions should take the lead to participate in theoretical study and set a fine example for others to follow. They have to comprehend, study and solve various problems arising from theoretical study promptly, to sum up seriously their experience and unceasingly dig deeper into theoretical study. We suggest that organization departments should take the cadres' performance in theoretical study into consideration when their proficiency is assessed.

LEARN FROM THE WOMEN'S VOLLEYBALL TEAM AND WORK HARD

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 19-22, 6

[Article by Rong Gaotang [2830 7559 2768]]

[Text] The victory won by the Chinese women's volleyball team in the third world cup championship has spurred patriotism on our physical culture front and the patriotism of people across the country and the will of people on various fronts.

Why has the victory evoked such wide repercussions? First, the team members have made history by gaining a major success in large-ball games for our country, won merit for the motherland, and realized the longstanding aspirations of leading veteran cadres and the broad masses of the people. Second, through television programs, broadcasts and news reports, the people of the whole country have been deeply impressed and enlightened by the determination and the stringent training of the team members. Third, the victory of the team has served to reflect the strong determination of the Chinese people in working hard to make their country strong and to boost the morale of the nation. The sportsmen of our country made good achievements in a series of major competitions last year and the people across the country were very happy to hear the good news that kept pouring in. People understand that a nation must not brood over the long period of past sufferings. On the contrary, it must pluck up its spirit, do a good job of realizing the modernization program and march forward with big strides.

The road taken by the women's volleyball team is arduous. Historically, I think the experiences of the team can be summarized in the following eight points.

1. Have Ideals and Aspirations for Scaling the World's Heights

Throughout its history, our party has always educated the sportsmen of our country to cherish high ideals and aspirations and dare to scale heights so as to win merit for the motherland. This education has become the definite goal for our struggles and is a glorious tradition.

The attitude taken by a collective or by an individual toward their tasks is fundamentally related to whether or not they make progress. Different ideals and goals will consequently be accompanied by different degress of broadness in the field of vision and by different efforts. Following the world championship won by our table tennis team in 1961, Comrade He Long demanded that we also win championships in large-ball games. In 1964, Comrade Zhou Enlai invited Mr Omatsu, Japanese volleyball coach, to help our country train volleyball players and give demonstrations in Shanghai. Comrade He Long also put forth the slogan of the "three fearlessnesses and five up-to-the-mark's," which means fearing neither hardship, fatigue nor injury and being up to the mark in ideology, skills, physical condition, training and competition. All these are aimed at winning world championships. It was a pity that while this goal was yet to be realized, the women's volleyball team slid from sixth in the world to 14th during the "Great Cultural Revolution."

That the team was able to win the world championship is inevitably linked to certain social and historical conditions. If the team members' ideals of winning world championships were still considered today as displaying the champion mentality and criticized as revisionism, the players would hardly have been able to win the championship just by relying on their own small number. The team has been able to take a healthy road only under the conditions of the new historical period in which the party has restored order, emancipated thinking, advocated the work style of seeking truth from facts and educated sportsmen to win merit for the motherland.

Over the past few years, the members of the women's volleyball team have been dreaming of the situation in which the national flag is hoisted, the national anthem is played and they receive gold medals. In addition, they regarded sparing no efforts for their motherland as their greatest happiness. The team ranked fourth in the second world volleyball championship in 1977, and team member Cao Huiying received the blocking net medal, courage medal and best sportsman medal. But she said: "Even if I received 100 medals, it could not compare with winning a championship for the motherland." The team defeated the previous Olympic champion, the Japanese team, and the world's fourth-ranked team, the North Koreans, in the second Asian volleyball championship in 1979 and consequently won the championship. This victory inspired the patriotic feelings of compatriots in Hong Kong and Macao and the broad masses of people at home. People said: "Volleyball fans love China all the more." Team member Chen Yaqiong was asked by her family in Hong Kong to stay there, but she said: "My cause is in the motherland."

Volleyball is a sport that is needed by the motherland, and many of the players have contributed their youth and even life to promoting the sports. Team coach Ma Zhanyuan was persecuted during the "Great Cultural Revolution" and his parents in Canada asked him to go there to inherit their property. But he said with determination: "I'm a communist, and I can in no way be separated from either the socialist motherland or the volleyball, which I like so much. I've not yet completed the tasks assigned me by Comrade He Long!" He devoted his life to volleyball, right up to the end. A player who was critically ill asked her mother to help her dress her in red sportswear for her passing away. A coach who was suffering from heart attack continued his coaching during a competition, and died in carrying out his duty. His family demanded just one thing: "Let him take a ball with him!" And a white ball became a precious burial item for this loyal fighter. With all these in mind, we can understand more profoundly the significance of the words spoken by the girls of the team with regard to the cause of volleyball: "Youth is precious, but the cause is more precious," and the fact is that the cause of sports is a revolutionary cause for which sportsmen have been training hard and sacrificing themselves one after another and from generation to generation.

2. It Is Imperative To Be Courageous and Confident in Tackling Any Difficulty

It is by no means an easy task to the championship of the world, which is so vast. Our women's volleyball team has experienced unimaginable difficulties in its struggles. Neither the courage nor the confidence of the members of the team has ever been eliminated in their road of advance. They are confident that, with their socialist motherland and with the party's leadership and the support of the people, their cause will surely win victory through their efforts, generation after generation. They understand that the road to championship is tortuous and that victory belongs to those who march forward courageously and stubbornly. They postponed falling in love and marriage, gave up opportunities for family reunion, rest and recreation and endured sickness, fatigue, injuries and pain. In short, they are "carrying out their cause at the cost of their life." A member of the team, Lang Ring, said: "If we want to score achievements that outstrip others, we have to pay the highest price."

In the face of strong rivals in the world, the Chinese women's volleyball team has followed Comrade Mao Zedong's thinking on strategically belittling difficulties and tactically taking them seriously. The team dares to win victory and is good at competing. A team coach said: "My heart will remain restless until the team wins the championship cup." The members of the team have always tried to find out their own shortcomings and the superior points of their opponents and spared no efforts to win.

The ideological basis for the members of the team in surmounting difficulties stems from their high responsibility, and their material basis for overcoming difficulties comes from their daily hard training. The team has been able to defeat so many strong rivals and win the world championship very largely because of the ideological guarantee and the skills and tactics displayed by the players during the matches. The team analyzed the strength and inferior and superior points of themselves and their rivals. Each player is required to talk about her own thinking and to grasp the skills needed for her to deal with her opponent. The players of the team won all of their seven matches in the third world championship and this was made possible by relying on the results of the protracted training in ideology, skills, tactics and physical training. The victory can in no way be easily achieved in one move.

3. It Is Imperative To Have Correct Guiding Ideology in Training

The skills in world sports have been developing rapidly. Strategically, attack and defense promote each other while technique and skills condition each other. The emergence of new technique enriches strategy and the emergence of new strategy, technique and methods of training only comes about in competition; they can in no way remain unchanged. Therefore, it is necessary to constantly innovate, to proceed from one's own specific conditions and to learn from and use new things in a predicted and planned way.

Volleyball technique is constantly developing. The Chinese national women's volleyball team pays much attention to studying the situation and trends of strong teams in the world, analyzing the advantages and disadvantages of various techniques and absorbing the advantages. Proceeding from actual conditions, the team has also spared no efforts to develop its own characteristics and has taken a road characterized by its own particular technique.

Any sport in which country has done well has its own correct guiding ideology for training. Many sports are still lagging behind because there are so many contradictory views that it is difficult to decide who is right. We have suffered much from such situations. The Chinese women's volleyball team has maintained its feature of fast attack, constantly developed skillful techniques, and absorbed the defense technique of the Japanese team and the technique popular in Europe. The comments made by world volleyball circles pointed out that the road taken by China for developing technique is correct.

Under the guidance of the correct guiding ideology in training, the members of the team are not content with their current standard. They have learned the technique of cushioning the ball from the Japanese team, to enrich their own technique. They have also created some technique based on their own feature of fast attack. They are always required to think hard, and spare no efforts to make one new breakthrough after another. All these things are invaluable.

4. It Is Imperative To Carry Out Strict and Hard Training

Diligent learning and hard training are the basic practical activities of the members of the team. They understand that without hard training it is impossible for them to master good technique. The reason why they have been able to complete technical movements and to coordinate technically in competitions is in fact the result of their accumulated experiences and hard training. The sportsground is the place where they carry out most arduous struggles; it is also where their youth is at its prime. Team member Chen Zhaodi said: "Some people spent their youth amid flowers and under the moonlight, while ours is spent amid the song of stress and tension."

The members of the team have formed a good tradition of hard training. The late Premier Zhou Enlai watched them training in 1964 and encouraged them to "learn from and overtake Japan." Many people worried whether the members of the team could stand such arduous training. Yet they have been able to persist in such training, which can be said to be unprecedented in the world, and consequently, they have shown the way for the sportsmen of the whole country.

In order to meet the needs in competition, they carry out arduous, difficult and strict scientific training, while the volume of their daily training surpasses or nears the intensity of a major international competition. Such training is a serious test of will and physical conditions. Yet the members of the team understand that they are carrying out such training for the sake of the prestige of their motherland, for realizing the victory yearned for by the broad masses of the people and for making Overseas Chinese feel proud of the Chinese people, who have stood up; consequently they are able to stand up to all difficulties. Thus, through years of hard tempering of their will, physical conditions and skills, they are becoming stronger.

Their training is stringent yet scientific. Their coaches set strict, impartial and incorruptible demands, but do so in the right way, not willfully and recklessly, and show them the results of their training. Consequently, they are convinced of the value of such training and willing to persist, no matter how strenuous it is.

The players were able to remain calm and display their skills well during the third world championship thanks to the pressure imposed on them in their daily training. They competed very hard in the last 2 days. In the last day but 1, they defeated the U.S. team 3-2. International news services commented: "The physical condition of the Chinese players will be an obstacle to victory." But the fact was that they did not wear themselves out. Amid roars and shouts, they competed calmly and in the end overpowered their rivals and won complete victory.

5. It Is Imperative To Have a Good Traditional Style

The Chinese women's volleyball team represents a good collective with good traditional style. Its work style represents a comprehensive manifestation of people's thinking and deeds; it is invisible strength. A good work style is an important guarantee for good training and competition. The team pays much attention to education in ideological style and has maintained its good style generation after generation.

Members of the team often help each other in such matters as how to correctly understand the relationship between ideological style and technique. New members become acquainted with the devotion and the hard struggles of players of the older generations. The coaches talk about their own experiences and lessons in an effort to teach the players to understand the importance of ideological style. When a problem crops up within the team, the leadership applies this problem to carry out collective education to help all the players increase their understanding and draw a lesson from the problem.

The ideological style of the Chinese women's volleyball team is to unite for winning still higher standard; it is strict and conscientious. The girls of the team intentionally temper their will under difficult conditions. The team visited the United States in March 1980. They flew for 24 hours and changed planes 4 times; they were sick on arrival but continued their training. In 1979, the team visited Japan and lost the last game 2-3 after leading earlier. The reason for the defeat of the team was that the main attackers did not coordinate well. The team took this as an example to teach the players and help them understand the importance of unity. The team is characterized by its endurance of hardship and difficulties in training while its style in competition is one of daring to fight hard. All the players have vigor to overpower their rivals and they get into active positions to attack. They do not relax their efforts when they are leading, do not lose confidence when they are lagging behind, do not hesitate at critical moments and compete doggedly till the last minute. During its match with the Japanese team in the third world championship, the Chinese team was 14-15 down in the 5th game. A Chinese player, Chen Yaqiong, saved strong attacking ball and organized a new attack. The team won the game 17-15. Another player, Chen Zhaodi, was suffering again from an injury to her stomach; she could hardly run and was criticized by the coach. In order not to influence the coach in making a decision, she did not say a word; she did warming-up exercises with tears in her eyes. She played stubbornly until her team won the cup. She was helped from the court and carried on people's backs to the Chinese Embassy and to the bus and plane. All these things demonstrate the doggedness of the players. The life of these girls is alert and lively. They can correctly handle honor and marriage, and they do not pursue vulgar tastes.

The main measure taken by the team in fostering good style is to combine ideological education with strengthening management and setting up responsibility systems, with cadres and party members taking the lead. The party group in the team has persisted in holding meeting during the most critical moments of competitions since the team joined the world championship in 1978. Key party members are responsible for important tasks, and they first of all seek the reasons for problems within themselves. All these things have ensured the formation of a good style.

6. Pay Attention to Selecting and Nurturing Talent

Another reason why the team has been able to make rapid progress and become strong is that it has concentrated the finest talents across the country. Selection is the premise for nurturing talent, and with rational selection, the nurturing and training of a player will produce twice the result with half the effort.

Volleyball is an all-round game of body height, physique, technique, tactics and determination. The Chinese women's team began to pay attention to the height of its members, and now their average height is among the tallest in the world. In addition, training is carried out in a way so that each player is able to display her advantages and make up for her shortcomings; requirements are set according to the specific conditions of each player. The coaches know the players well enough to be able to assign them tasks commensurate with their abilities. Thus, as each player is able to display her strong points, the whole team has a balanced strength.

The players on the team pay attention to selecting talent in competitions, and test and examine the standard of each player in will, physique and technique through acute competition. But the selection cannot be made just through selective competitions; it must be made through repeated study and investigation of a player, from her comprehensive behavior and deeds, from predictions of her progress, from widely soliciting opinions and through full discussion. Particular treatment is given to a particular talent so as to ensure that the talent can be concentrated effectively to display its advantage in mastering the most advanced techniques.

The team is bold in training new members by combining them with experienced ones. Veteran players are willing to help their new colleagues, while the latter are willing to become good successors and inherit the experiences of their predecessors. For the sake of the common goal, veteran players are happy to see that new players have been able to catch up with or surpass them, and they are not jealous of such progress. A member of the team, Yang Xi, was still in her prime technically during the eighth Asian games in 1976, and was more experienced than her colleague Lang Ping. But in order to further new players and for the interest of the whole team, she happily gave up her place to become a reserve player.

7. It Is Imperative To Have a Strong and United Leading Group

The cadres and coaches of the Chinese women's volleyball team have formed themselves into an elite working team with close coordination. They all treasure their cause, help and support each other, exchange different views but take unified action in their tasks, and "prop up" rather than counteract each other. When Yuan Weiming became a coach of the team, team coach Deng Ruozeng asked to become his assistant. Deng has more experience than Yuan, yet he wanted to take the more arduous job so that Yuan would be able to concentrate his efforts on improving the standard of the whole team.

The cadres and coaches demand that they themselves master the knowledge of their profession, and get to know the development of volleyball technique in the world and the strength of their own team and other teams. Consequently, they are able to carry out training, assign players and guide competitions with a fairly good idea, and cope with difficulties.

They are able to set examples through their own deeds, set strict demands on themselves; with wholehearted devotion to the team, they sweat more and think more than the players. They often put forward new problems and find good methods to solve them in an effort to make more progress. They are bold in management, and they manage well. They set even stricter demands on key players; they do not coax or flatter them. Thus, sharing weal and woe, the cadres, coaches and players of the team train strictly. They do not criticize others at will. They are concerned for and trust each other and cooperate happily.

They carry out ideological work even during training and competition and teach players to correctly view hardships, difficulties, victory and defeat. Thanks to such education the players are highly conscious when carrying out dogged training and they are happy to face difficulties. They are able to overcome various interferences during competition and concentrate their efforts. They are not arrogant in victory and they do not lose heart in face of a setback.

8. Volleyball Circles Across the Country Should Unite With One Mind and Coordinate Closely

The team's victory was the collective result of volleyball circles throughout the country in mastering advanced techniques. Many strong teams in the country joined in collective winter training for 9 successive years to help improve the standard of the national team and their own teams. The members of these teams did not have family reunions for 7 or 8 years. Many teams across the country sent their own best players to the national team. The PLA volleyball team sent four or five players and coaches, and the Sichuan team sent three key players. Consequently, these teams were themselves in difficulties for many years. The Jiangsu team sent its coach, Yuan Weiming, and three second-passers and assigned four key men players and one international umpire to help the national team; consequently, the team lost its chance of winning the national championship. Nonprofessional teams also sent their key players to the national team as reserve players. Heilongjiang Province recently sent eight of its best players to be reserves of the national team. The measures taken by all these teams merit our respect.

Basically speaking, the experiences of the Chinese national women's team are the results of the concern of the party leadership, the support of the people, the superiority of the socialist system and the efforts of the players themselves. Without the conditions and situation that appeared following the 3d Plenary Session of the 11th CCP Central Committee, the players would not have been able to win no matter how hard they worked. On the other hand, we cannot just pay attention to conditions and neglect objective efforts. The victory was also the result of the fact that the ranks of sportsmen across the country learned from the experiences of fraternal units, such as the national table tennis team and mountaineering team. The experience of the women's volleyball team is the common treasure of our physical cultural front.

The players on the team have done a good job, but this does not mean that there is nothing left to be desired. In other words, with the development of their cause, they face new problems. First, their position has changed. Strong teams in the world will no doubt study the Chinese team in an effort to catch up with or surpass it. Our team will become the main target in the next championship. Many teams in the world now have almost the same strength, while some have better conditions than our team in some aspects and might well make greater progress. Therefore, we have heavier training tasks. Second, the party and the people have given us very high prestige and they have set higher demands. We must, therefore, guard against being arrogant and finicky and carry out more ideological and political work.

There is no end to the development of a cause. The Chinese women's volleyball team must learn from the constant vigor of the table tennis team. We hope that the women's team will be able, in the new situation, to make new progress and score greater achievements.

AN IDEOLOGICAL TREASURE FROM THE UNITED FRONT--STUDYING THE EXPOSITIONS CONCERNING THE UNITED FRONT CONTAINED IN VOLUME 1 OF THE 'SELECTED WORKS OF ZHOU ENLAI'

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 23-27

[Article by Yang Chao [2799 6389]]

[Text] Comrade Zhou Enlai was a great Marxist and proletarian revolutionary as well as a long-tested outstanding leader of the CCP. During the protracted revolutionary struggle in our country, he worked with all-out efforts and showed his outstanding talent, doing immortal meritorious service for the cause of the party and the people. The important works on political, military, economic and cultural affairs during the period of the democratic revolution in our country included in volume 1 of the "Selected Works of Zhou Enlai" (hereafter referred to as "Selected Works") were valuable documents summing up the successful experiences of the Chinese revolution, and they made an indelible contribution to the formation and development of Mao Zedong Thought.

During the period of the new democratic revolution, Comrade Zhou Enlai persisted in integrating the universally applicable principles of Marxism-Leninism with the concrete practice in the Chinese revolution and gave many incisive expositions on the questions regarding the united front. In his three articles, "On the Relations Between the CCP and the KMT From 1924 to 1926," "On the Party Sixth Congress" and "On the United Front," which are included in volume 1 of the "Selected Works," he summed up and discussed systematically, comprehensively and profoundly the party's work on the united front during the new democratic revolution. Seriously studying these articles is of vital significance in studying the historical development of the united front, summing up the experience and lessons on the united front, and guiding our work in the united front during the new period.

I

The united front was one of the three magic weapons by means of which the Chinese revolution triumphed. Fundamentally speaking, the great importance it had and the important role it played were determined by the nature of the Chinese society and the situation of class relations. Old China was a semicolonial and semifeudal country in which the imperialists, the landlord class and the bureaucratic bourgeoisie were the objects of the revolution. They acted in collusion, forming a tremendous reactionary force. At the same time, old China was a society which was small at both ends and big in the middle, that is, the proletariat, the landlord class and the big bourgeoisie accounted for the minority while the peasants, the urban petty bourgeoisie and the national bourgeoisie accounted for the overwhelming majority of the country's population. For this reason, in order to defeat the three tremendously powerful enemies and triumph in the Chinese revolution, the proletariat had to unite with all revolutionary classes and strata to form a revolutionary united front under all circumstances. To form this united front, it had to appropriately analyze and appraise the conditions of the classes in Chinese society and distinguish between friends and enemies. Applying the dialectical and historical materialist viewpoint, Comrade Zhou Enlai incisively analyzed and correctly elaborated on these conditions. He said: "The new democratic united front consists of the proletariat, the peasantry, the petty bourgeoisie and the liberal bourgeoisie, and at times even includes some big landlords and members of the big bourgeoisie. So our ranks cover a broad spectrum." (p 211) Although the proletariat is "small in terms of numbers and strength," "its political consciousness is high and its ability great" and it "is the backbone of our forces." (p 211) "The peasantry, which makes up the bulk of these forces," is "the most dependable ally" of the proletariat. (p 211) "The urban petty bourgeoisie is also a basic force in the ranks of the new democratic revolution." (p 212) The liberal bourgeoisie (that is, the national bourgeoisie) on the one hand maintains ties with feudalism and imperialism and on the other hand is oppressed and fettered by them, so that it has a dual character, that is, it shows a tendency toward compromise and a tendency toward revolution. "The proletariat should win it over, unite with it, or at least neutralize it." (p 212) The various groups of the big bourgeoisie receive support from different imperialist blocs. When the spearhead of revolution is pointed at a certain imperialist bloc, the groups of the big bourgeoisie, which are related with other imperialist blocs, might join in the struggle against this bloc. The proletariat might form a united front with these groups of the big bourgeoisie in order to weaken the enemy force and strengthen its own reserve. However, "reaction is deeply ingrained in them. So, in cooperating with them, we must be constantly on our guard and oppose their reactionary tendencies." (p 213) These analyses and elaborations made by Comrade Zhou Enlai were of vital significance in guiding united front work during the new democratic revolution.

Leftist and rightist errors have occurred many times in the history of the Chinese revolution. These errors were expressed in different forms. An analysis of the class relations showed that people who made these errors did not proceed from the actual conditions in Chinese society and could not grasp the changes in the class relations in the course of development of the actual conditions, so that these errors impeded the development of the revolutionary united front. People who made rightist errors saw only the tendencies of the national bourgeoisie toward the revolution but did not see its tendencies toward compromise. They saw only the possibility of some groups of the big landlords and big bourgeoisie joining in the united front under certain historical conditions and forgot their reactionary character. They even regarded the programs, policies and ideologies of the proletariat and the bourgeoisie as the same and ignored the essential difference between the proletariat and the bourgeoisie. Consequently, they pushed the capitulationist policy in the united front. People who made leftist mistakes equated the Chinese bourgeoisie with the bourgeoisie of the capitalist countries, overlooked the possibility of the national bourgeoisie participating in revolutionary struggle in a certain period of time and to a certain degree, and even mistook the petty bourgeoisie as an enemy of the revolution and arrived at "closed-doorism," which caused the Chinese revolution grave losses and serious defeats. "The right deviationists give away the whole army, while the 'left' deviationists push it away." (p 220) With this remark, Comrade Zhou Enlai pointed out sharply the consequences and essence of these two wrong policies.

The new democratic revolution in our country had a very long course of development. Comrade Zhou Enlai said: "Owing to frequent changes in the relations between the enemy and ourselves and in the conflicting camps, as well as to constant change in the overall situation," "the form and nature of the united front varied" in different periods of time. (p 207) This was another correct thesis formulated by him by summing up the development of the united front in our country.

Comrade Zhou Enlai pointed out: "We had an anti-imperialist and antifeudal national united front" during the first civil revolutionary war period. (p 207) At that time, the party's united front policy quickly brought about an upsurge in the revolution, and the workers' and peasants' movement, which was aimed at fighting imperialism and feudalism, developed vigorously. Under these circumstances, our party helped the KMT establish the national revolutionary army, which triumphantly launched the Northern Expedition and defeated the northern warlords. Later, because Chiang Kai-shek betrayed the revolution and Chen Duxiu exercised rightist capitulationist leadership in the party, this great revolution ended in failure and the united front broke up.

With the great revolution ending in failure, the new KMT warlords represented by Chiang Kai-shek ruled the country, and the national bourgeoisie chimed in with the counterrevolution. Only the proletariat, the peasantry and the petty bourgeoisie (including the revolutionary intellectuals) remained in the revolutionary camp. The Chinese revolution entered a new period. The united front in that period was a worker-peasant alliance, which Comrade Zhou Enlai called "a democratic worker-peasant national united front against feudal oppression and KMT rule." (p 207) After the "18 September" incident in 1931, because Japanese imperialism stepped up its armed aggression for the purpose of subjugating the whole of China, the contradiction between the Chinese nation and Japanese imperialism became the principal contradiction and that between different classes in China became a secondary one. Under these circumstances, our party suggested "stopping the civil war and uniting all forces to resist the Japanese." It drew up the strategy and policy of building an anti-Japanese national united front. The peaceful settlement of the subsequent "Xian incident" accelerated the realization of the second KMT-CCP cooperation and the formation of the anti-Japanese national united front. Owing to the correct line and policies adopted by our party, the anti-Japanese national united front was maintained and the people's forces grew in number and strength throughout the period of the war of resistance against Japan.

New changes took place in the relations between classes in China after victory in the war of resistance against Japan. With the support of U.S. imperialism, the KMT led by Chiang Kai-shek, which had shown itself to be a diehard force in the anti-Japanese national united front, declared a full-scale war on the CCP and the people in July 1946. The second KMT-CCP cooperation broke down. At that time, our party led and developed the people's democratic united front, calling on all oppressed classes, democratic parties, mass organizations and minority nationalities throughout the country and patriotic Overseas Chinese as well as patriots in various other fields to unite to topple Chiang Kai-shek and liberate China. As the people's war of liberation developed triumphantly, the people's democratic united front grew in scope and became more consolidated.

Reviewing the history of development of the united front, Comrade Zhou Enlai further pointed out: The changes we have encountered in the united front have been so frequent, so great and so complicated that we must be clear-headed and be able to investigate problems and study them analytically, so that we shall be "capable of correctly understanding the changing contradictions in the course of history, identifying and analyzing the enemy at all times and setting forth a correct policy for defeating him." (p 209) He repeatedly stressed that we should grasp the different characteristics in the united front in different periods of time; we should neither take friends as enemies nor enemies as friends; we should not take as enemies all who were enemies yesterday but have become friends today, and should not consider as friends all who were friends yesterday but have become enemies today. His thesis in this respect incisively summed up both the positive and negative experiences and lessons and elaborated on the theory of the united front from the high plane of distinguishing between friends and enemies.

II

The question of the united front is a question of how the proletariat should organize and lead its allies in the revolutionary struggle.

Because of the above-mentioned characteristics and conditions existing in Chinese society and in class relations, the proletariat first of all had to form a close alliance with the peasantry. Summing up the experience of the Chinese revolution, Comrade Zhou Enlai pointed out: "It is necessary in the new democratic revolution to rely on the most dependable ally--the peasantry--which makes up the bulk of our forces and, as Comrade Mao Zedong has put it, constitutes four out of five fingers." (p 211) By winning over this ally, the proletariat united with the majority of the Chinese people, thereby laying a firm foundation for the revolutionary united front. Comrade Zhou Enlai profoundly criticized the "left" and right deviationist mistakes in regard to this question. He pointed out: "It is a 'left' deviationist mistake to rely not on the peasants but only on the proletariat, expecting it to charge forward alone. The result is isolation. It is a right deviationist mistake to rely on the bourgeoisie, especially the big bourgeoisie." He also arrived at the correct conclusion that "with the peasants we can both advance and retreat; without them we can advance only in small numbers and in isolation, and there is no place to retreat to." (p 211)

The proletariat's dependable ally also consisted of intellectuals, handicraftsmen, professionals and small traders, who together formed the petty bourgeoisie. Conditioned by their economic status, they might vacillate to a certain extent in the revolutionary struggle but would join in and support the revolution on the whole. They were therefore an excellent ally of the proletariat. Comrade Zhou Enlai paid close attention to the situation of the petty bourgeoisie and the role it played in the united front. He emphatically pointed out in many of his articles: "The democratic dictatorship of the workers and peasants does not exclude, but definitely includes, the petty bourgeoisie" (p 160) and "we are strong only when the workers, peasants and petty bourgeoisie stand united." (p 212)

In order to strengthen itself as much as possible and to form the broadest possible united front, the proletariat, on the basis of establishing the worker-peasant alliance, had to strive to win over the middle forces between the enemy and ourselves, unite with all people who could be united, and mobilize all positive factors to form an alliance of all working people with all other people who could be united. This alliance chiefly included the national bourgeoisie and, in given historical conditions, also included the enlightened gentry and the regional power groups who had split with the landlord class. It even included some groups of the big landlords and big bourgeoisie. Comrade Zhou Enlai said: "Some people say we only want to win the allegiance of the peasants and the petty bourgeoisie. That is not true. We also want to win the allegiance of the liberal bourgeoisie." (p 217) Accordingly, while working in Chongqing, he meticulously did a great deal of work on the middle forces, giving democratic parties active support, maintaining extensive contacts with industrialists, businessmen, intellectuals and representatives of various other circles and making strenuous efforts to win them over to the side of the people. At the same time, he paid close attention to showing solicitude politically, ideologically and in everyday life for people of all walks of life who sympathized with and supported the cause of people's liberation. He said: "From now on, we must see to it that the safety and health of our progressive friends are ensured.... We must give them more material help and economic assistance and show constant solicitude for them politically." (p 238) Shown concern in every possible way by him, many friends outside the party rallied more closely around the party and made useful contributions to fighting the common enemy.

In short, Comrade Zhou Enlai not only showed theoretically the necessity and importance of winning over the middle forces, but also made gigantic efforts in practice to win over these forces, thereby making a valuable contribution to developing and strengthening the revolutionary united front.

III

Upholding leadership by the party is a basic principle in the united front. Each of the classes, strata and groups within the united front during the new democratic revolution had "its own aims" and "its own interests to pursue" (p 1) and "wanted the united front to be led according to its own ideas." (p 216) For this reason, the struggle for leadership was inevitably the focus of the contradictions and struggles within the united front. Comrade Zhou Enlai pointed out: "The proletariat, being more progressive than the other classes, should lead the others and be what Comrade Mao Zedong calls 'the commanding officer.' But the proletariat does not gain the position of command automatically...because others are contending with the proletariat and the Communist Party for leadership--not only the big bourgeoisie but also the liberal bourgeoisie and the petty bourgeoisie.... But the main force contending with us for leadership is the KMT, the ruling group representing the big landlords and the big bourgeoisie. Therefore, it is mainly the KMT and the CCP which struggle with each other for the leadership of the united front. The big bourgeoisie is our principal opponent." (p 216) In order to win victory in the new democratic revolution, our party had to adhere to the principle of independence, uphold leadership in the united front and carry out complicated, acute struggle against the KMT which represented the big landlords and the big bourgeoisie.

The KMT, the ruling group representing the big landlords and the big bourgeoisie, held the political and military power and the economic lifelines of the state, and reaction was deeply ingrained in it. In the course of forming the united front with the proletariat, therefore, it constantly and firmly opposed the ideological, political and organizational development of the proletariat and its political party and strove to seize leadership in the united front and wipe out the forces of the proletariat and its political party. Entrusted by the party Central Committee, Comrade Zhou Enlai constantly upheld the party's leadership in the united front during his long-term united front work inside the KMT. In his article entitled "The CCP in the Present Political Struggle" written in December 1926, he pointed out in unequivocal terms that, in cooperating with the KMT, the proletariat and the CCP must be independent politically and organizationally and must also firmly grasp leadership and uphold the correct ideas of supporting the left and attacking the right. He said: The KMT-CCP cooperation "does not mean that the CCP has lost its identity and should no longer have any independent views.... The communists, while supporting the KMT and the national government, should nevertheless put forward the political and economic demands of the workers and peasants, within the limits of democracy, and press the KMT government to fulfill them one after another." (p 3) He publicly exposed the counterrevolutionary activities of the KMT right wing. He scathingly denounced: They "have obviously been active in opposing the communists, the Soviet Union, and the workers and peasants and in collaborating with the forces of tradition." (pp 3-4) He clearly announced: "Faced with diverse tendencies, the communists have consistently joined forces with the left wing in waging both ideological and practical struggles against the right." (p 4) With the revolutionary movement developing rapidly and the contention between the bourgeoisie and the proletariat for leadership in the united front sharpening with each passing day, Comrade Zhou Enlai led the revolutionary students' organization of the Whampoa Military Academy in actively propagating the revolutionary theory and the party's policy regarding the united front and in uniting with all revolutionary forces to wage an acute struggle against the KMT right wing. However, at that time, Chen Duxiu exercised right capitulationist leadership, favored uniting with the bourgeoisie instead of fighting against it, and made three big concessions organizationally, militarily and politically to the KMT right wing. He also lacked a clear-cut policy toward Chiang Kai-shek, a counterrevolutionary careerist. Subsequently, Chiang Kai-shek launched the "12 April" 1927 coup d'etat in Shanghai, publicly betraying the revolution. This caused the KMT and the CCP to break with each other and the united front to break up. Reviewing and summing up this part of history, Comrade Zhou Enlai incisively criticized Chen Duxiu and others for their erroneous right-deviationist view that "a bourgeois revolution had to be led by the bourgeoisie and not by the proletariat, which should only assist the bourgeoisie; the proletariat should 'carry the sedan chair' for the bourgeoisie." (p 158) He pointed out that an important reason for the defeat of the great revolution was that Chen Duxiu and others abandoned the party's leadership in the united front and its struggle against the KMT right wing.

After the "18 September" incident, Japanese imperialism stepped up its aggression against China. Disregarding the serious national crisis, Chiang Kai-shek and the KMT persisted in the policy of "internal pacification before resistance to foreign invasion," thereby "precipitating the Xian incident" in December 1936. (pp 192-193) The CCP Central Committee headed by Comrade Mao Zedong correctly analyzed the situation and made the policy decision of peacefully solving the "Xian incident" and compelling Chiang Kai-shek to resist the Japanese. It also sent Comrade Zhou Enlai as its plenipotentiary representative to negotiate with Chiang Kai-shek in Xian. In the negotiations, Comrade Zhou Enlai firmly carried out the party Central Committee's policy and compelled Chiang Kai-shek to accept our party's proposal for stopping the civil war and uniting to resist the Japanese, thereby promoting the establishment of the anti-Japanese national united front. Throughout the great revolution and the second revolutionary civil war, our party saw Chiang Kai-shek's reactionary nature more clearly. Commenting on the point that Chiang Kai-shek and the KMT were compelled to join in the anti-Japanese national united front, Comrade Zhou Enlai said: "Chiang Kai-shek and his group, who represent a section of the big landlords and the big bourgeoisie, took part in armed resistance, but they were still essentially reactionary." (p 209) At that time, as our party's permanent representative in Chongqing where the KMT government was situated, he faced danger fearlessly, firmly carried out the party Central Committee's principles and policies, and fought tit for tat against Chiang Kai-shek's and the KMT's reactionary behavior of passively taking part in armed resistance and actively opposing the communists.

After the Japanese surrender, the KMT reactionaries, for the purpose of seizing the fruits of victory of the armed resistance against the Japanese and with the support of U.S. imperialism, played the trick of "peace talks" while preparing for a full-scale civil war. To realize the people's wishes and expose Chiang Kai-shek's true features in the course of struggle, Comrade Zhou Enlai accompanied Comrade Mao Zedong to negotiations with Chiang Kai-shek in Chongqing in August 1945. Afterward, he led our party's delegation to a political consultative conference attended by various other parties. As a result of the intelligent and firm struggle launched by Comrade Zhou Enlai and others, the KMT was compelled to accept the plan and agreement that was favorable to the people. Chiang Kai-shek and the KMT flagrantly scrapped this agreement soon afterward. Still, Comrade Zhou Enlai's militant spirit of upholding the principle of independence and firmly defending the revolutionary forces deserves to be respected and remembered forever.

Comrade Zhou Enlai made full expositions on the united front. He summed up his experiences and theories on the united front (which are carried in volume 1 of the "Selected Works") during the period of the new democratic revolution. However, his basic ideas and principles concerning the united front are useful to us as long-term guidance. Since liberation, we have united with the revolutionary classes and strata and all patriotic democrats, continuously developed and strengthened the revolutionary united front under the party's leadership and on the basis of the worker-peasant alliance, and won great victories in our country's socialist revolution and construction. Our country has now entered a new historical period. In order to build China into a powerful modern socialist country, to accomplish the great cause of returning Taiwan to the embrace of the motherland and unifying the motherland, to oppose hegemonism in world affairs and to defend world peace, we must still unite with all forces which can be united, and fully arouse all positive factors to develop and strengthen the revolutionary patriotic united front. In the new historical period, therefore, the united front remains an important magic weapon which should be strengthened instead of being weakened. We must go further to reeducate all party members on the party's policy regarding the united front and wipe out the ideological influence of the Lin Biao and Jiang Qing counterrevolutionary cliques, so that the party's united front work can better accomplish the general tasks during the new period.

ETERNAL GLORY TO A MAN WHO WORKED FOR THE PARTY ALL HIS LIFE--IN MEMORY OF COMRADE DENG ZIHUI

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 28-32

[Article by Liu Ruilong [0491 3843 7893]]

[Text] Comrade Deng Zihui was one of the party's outstanding leaders of the peasant movement. During the agrarian revolution, he was one of the founders of the western Fujian revolutionary base. During the war of resistance against Japan, he was one of the key leaders of the northern Jiangsu-central China revolutionary base and the New Fourth Army. After liberation, he was a brilliant leader and organizer of the cause of China's agricultural collectivization. Whether in the stage of the new democratic revolution or in the stage of socialist revolution and socialist construction, he made important contributions to the party and the people, devoted his lifetime energies to the revolutionary cause, and was always cherished and held in esteem by the people.

Comrade Zihui and I worked together, at different times, for a total of 16 years. Nine years have elapsed since he passed away. I deeply cherish the memory of Comrade Deng Zihui with high esteem.

I

It was in May 1941 that I met Comrade Deng Zihui for the first time. He was first entrusted by the Central China Bureau of the CCP Central Committee and the headquarters of the New Fourth Army to inspect northern Jiangsu Province. Later the CCP Central Committee decided that he should stay there and be political instructor of the 4th Division and secretary of the district CCP committee. It was also at that time that I was recalled to work there. Before I met him, I had heard that, together with Comrade Chang Dingcheng and others, he had led the peasants of western Fujian Province to stage an uprising and establish the western Fujian revolutionary base in the spring of 1928. When the central worker-peasant government was founded, he was appointed minister of finance, leading the work of developing the economy of the central soviet areas. Later, when the Red Army began the Long March, the CCP Central Committee left him together with Comrades Xiang Ying, Chen Yi, Tan Zhenlin and Chang Dingcheng and others, who persisted in struggle during the extremely difficult 3 years of guerrilla warfare. After the beginning of the war of resistance against Japan, he joined in the leadership work of the New Fourth Army. Prolonged revolutionary struggles tempered him into a strong-willed and richly experienced revolutionary. We were delighted to the bottom of our hearts at his arrival.

When Comrade Zihui arrived in northern Jiangsu, the 4th Division of the New Fourth Army had just been transferred from the western side of the Tianjin-Pukou railway line to its eastern side. The base areas on the eastern side of the railway had not been held for very long, the masses had not yet been aroused and the revolutionary bases were not very consolidated. At that time the situation was grave. There existed a tripartite confrontation between the enemy, local armed diehards and ourselves. Under these circumstances, the pressing tasks at that time were how to rapidly arouse the masses, expand the people's armed forces and establish and consolidate the revolutionary bases. Comrade Deng Zihui and Peng Xuefeng and others of the district CCP committee resolutely carried out the directive of the CCP Central Committee and its Central China Bureau, a directive urging them to arouse the masses, organize the masses, expand the revolutionary forces and within two winter-spring periods build northern Jiangsu into a consolidated democratic anti-Japanese aggression base while seriously restructuring and expanding the main force and local armed forces.

In building the revolutionary bases, Comrade Zihui firmly grasped a key link, namely, going all out to mobilize and lead the peasants in waging the struggle for the reduction of land rent and loan interest. This was aimed at organizing the majority of the peasant masses to establish the political superiority of the basic masses, and at the same time correctly taking care of the interests of the various classes which resisted Japanese aggression. In June 1941, the district CCP committee held a meeting of the activists and studied the concrete policies for reducing land rent and loan interest in the regions of northern Jiangsu. After the meeting, large batches of cadres were sent to the countryside to mobilize the masses to carry out the struggle for the reduction of land rent and loan interest, thus improving the economic life of the peasants and arousing them to resist Japanese aggression. On the basis of the aroused masses, we set up anti-Japanese aggression and salvation associations, composed of workers, peasants, youths, women and so on. By the end of 1944, the membership of those associations had reached more than 1 million. We reorganized the local armed forces controlled by the landlords and transferred the guns into the hands of the people; completely restructured grassroots political power and established the "three-thirds system" of anti-Japanese aggression and democratic political power. This substantially raised the economic and political positions of the masses of workers and peasants and greatly weakened the feudal forces, thus establishing an order of new democratic revolution. While establishing the superiority of the basic masses, Comrade Zihui paid close attention to uniting various classes that were resisting Japanese aggression and to uniting all patriotic forces to join in the resistance against Japanese aggression. Often he did work which the democrats and the enlightened gentry did. He had a lot of friends among these people.

It was necessary to overcome the difficulties in supplying grain and funds to the revolutionary bases. Being good at managing finances and organizing production, Comrade Zihui led and perfected the government's financial and economic organs, and implemented unified progressive taxation, state purchase of grain, land taxation and goods taxation. He also set up the Northern Jiangsu Bank and issued border currency. At the same time, learning from the experiences of Yanan, he mobilized and organized the army and the people of northern Jiangsu to carry out a mass production campaign and develop agricultural and handicraft production. Every year we organized the masses to engage in spring plowing and in summer and autumn harvests, to build water conservancy projects, to plant cotton, and to study spinning and weaving. We also organized mutual aid teams and cooperatives and encouraged the peasants to work out plans to make every household prosper, and urged the labor heroes to carry out a production emulation drive. As a result, a great upsurge in production prevailed in northern Jiangsu under a war situation. We broadened sources of income and reduced expenditure, handled all revenue and expenditure in a unified way, practiced a unified budget and strict accounting, practiced a unified state treasury and strict audits, practiced strict economy and put an end to corruption and waste. This enabled us to quickly overcome the economic difficulties of the revolutionary bases and basically ensured clothing and food for the army and the people of northern Jiangsu.

In 1943, in the rectification movement led by Comrade Zihui and the district CCP committee, we ran a total of nine training courses in rotation, and Comrade Zihui made rectification reports many times to them. In the rectification movement, the cadres were organized to study documents, sort out the unhealthy tendencies of subjectivism, sectarianism and stereotyped party writing, and overcome nonproletarian thought. This resulted in the enhancement of the ideological consciousness of the cadres. In July 1944, when Comrade Liu Zijiu studied in the CCP Central Committee's party school, he wrote "a letter to the district CCP committee of northern Jiangsu concerning the question of study," which was authorized to be issued to the various revolutionary bases by Comrade Mao Zedong. Comrade Zihui organized the cadres and the army to study this letter, thus enabling them to further deepen the mass viewpoint. Through the rectification movement, Comrade Zihui handled two misjudged cases of Siyang and the northern Jiangsu middle school in a timely, realistic and practical way, with the result that the cadres were educated, unity was strengthened and the party's prestige was enhanced.

In the struggle to constantly establish, consolidate and expand the revolutionary bases, we won a series of victories in the military struggle against the enemy and local armed diehards. In the winter of 1942, through 33 days of bloody battle, we eventually smashed the large-scale "mopping-up operations" launched by the Japanese aggressors against our revolutionary bases. In March 1943, with the coordinated 2d and 3d Divisions under the unified command of Comrade Chen Yi, Comrades Peng Xuefeng and Deng Zihui led the principal force of the 4th Division and captured Han Dele alive. He was the commander of the KMT anticommunist command of Jiangsu Province in the Shanzitou battle, and after being educated, he was released and courteously sent over the border. In August 1944, Comrade Xuefeng personally commanded the principal force of the 4th Division in marching westward. They established eight county administrations, liberated 2.5 million people, recovered large parts of the revolutionary bases in the Henan-Anhui-Jiangsu border areas and, as a result, the revolutionary bases of northern Jiangsu were expanded to twice their former size. In commanding a battle, divisional commander Xuefeng heroically gave his life for his country.

After Comrade Zihui's arrival in northern Jiangsu Province, the work of the revolutionary bases in such fields as political power, armed forces, finance and economics, the united front and party building was pushed forward and deepened. Contingents which maintained close ties with the masses and were capable of fighting were educated and nurtured. He deserved to be called a good teacher and guide of the broad masses of the army and the people of northern Jiangsu. In recollecting this period of his military life, we cherish his memory all the more!

After the victory in the war of resistance against Japan, Comrade Zihui took up leadership work in the Central China Subbureau and East China Bureau under the CCP Central Committee successively in the Jiangsu-Anhui and Shandong liberated areas. In leading the struggle for land reform, he creatively put forth the policy of "starting at both ends and leaving the middle untouched," carried out the CCP Central Committee's "4 May" directive in an exemplary way, and corrected the "leftist" and rightist deviations which cropped up in the work of land reform. In leading the work of supporting the front, together with other leading comrades, he quickly put an end to the passive state of this work and met the logistical supply needs of our armies in central China and Shandong Province, thus creating favorable conditions for smashing the enemy's attacks and also providing the Huai-Hai campaign, the successful crossing of the Changjiang River and other campaigns with rich experiences.

II

After the nationwide completion of land reform, under the leadership of the CCP Central Committee and Comrade Mao Zedong, Comrade Zihui devoted all his energies and strength to organizing and leading the agricultural cooperativization movement and to developing socialist agriculture.

In early 1953, Comrade Zihui was transferred and appointed by the CCP Central Committee to be director of the Rural Work Department of the CCP Central Committee. Not long afterward, I was transferred to the Ministry of Agriculture and continued to work under his leadership.

Comrade Zihui invariably took a clear-cut, firm and positive attitude toward China's agricultural collectivization. He said to me: "Chairman Mao asked me to work in the Rural Work Department. This means organizing the several hundred million peasants to engage in agricultural cooperativization. This is the general principle and general task of rural work." He held that in developing agricultural production, we could not rely on the scattered and backward small peasant economy. The only way was to organize mutual aid and cooperation. The socialist transformation of the small peasant economy "could not waver." Together with comrades of the Rural Work Department, on behalf of the CCP Central Committee, he took charge of the work of formulating "decisions concerning developing agricultural producers' cooperatives" and other documents one after another and forcefully led and propelled forward the agricultural cooperativization movement.

Concerning the question of how to realize China's agricultural collectivization, Comrade Zihui maintained that it was necessary to proceed from the present condition of China's small peasant economy, supporting the peasants' enthusiasm for developing mutual aid and cooperation on the one hand and not dampening the enthusiasm of the individual peasant economy on the other hand. We had to adopt various transitional measures and transitional forms which were easy for the peasants to accept so that the peasants were able to enter the stage of socialism of their own free will and being well-prepared ideologically. He upheld the principles of "exercising active leadership and achieving steady advance" formulated by the CCP Central Committee, of voluntary participation and mutual benefit, of setting an example and of state assistance. He opposed noninterference or coercion, commandism as well as rashness. In early 1953, in some localities there emerged a phenomena in which the peasants were forced to join the cooperatives, the interests of the middle peasants were encroached upon and advanced forms were sought after blindly. He made timely suggestions to the CCP Central Committee in order to overcome impetuosity. The CCP Central Committee accepted his suggestions and issued one after another a series of documents to correct these deviations. They also compiled the "directives to the party committees at various levels concerning production in spring plowing" drafted on behalf of the CCP Central Committee by the Rural Work Department of which he was in charge, the RENMIN RIBAO editorial entitled "The Key to Leading Agricultural Production" and its "decisions concerning agricultural producers' mutual aid and cooperation" into a book entitled "A Guide to Present-Day Agricultural Work," which was issued throughout the nation to direct the movement. Comrade Mao Zedong personally wrote instructions in it, calling on personnel engaged in rural work "to make a serious study of it." At the first national rural work conference, he further emphatically criticized rash deviations and expounded the principle of "achieving steady advance." These measures played a positive role in the smooth development of the agricultural cooperativization movement at that time.

Before the autumn harvest of 1954, the agricultural cooperatives throughout the country had increased in number from 14,000 to 100,000, and in 1955 dramatically increased to 670,000. Because the growth rate was too fast, 7 billion jin of grain in excess of the state purchasing quota was purchased all over the country. A strained situation both in grain and in cooperativization emerged in a large number of places to varying degrees. In some places pigs and cows were slaughtered, trees were felled and production was sabotaged. This state of affairs attracted the attention of the CCP Central Committee and Comrade Mao Zedong. On 10 January 1955, the CCP Central Committee issued the "circular concerning the rectification and consolidation of the agricultural cooperatives," urging that measures to suspend the further expansion of, to appropriately reduce and to rectify the cooperatives should be taken in different regions. At the beginning of March in that year, the CCP Central Committee and the State Council issued an "urgent directive concerning rapidly arranging the work of grain purchase and sale and reassuring the peasants in production," pointing out that "it is necessary to reduce the pace of agricultural cooperativization." In the last 10-day period of March, Comrade Mao Zedong invited some leading comrades and put forth the principle of "suspension, reduction and expansion," pointing out that with regard to cooperativization, our policy was to suspend, to reduce and to expand. Those which deserved to be suspended should be suspended, those which deserved to be reduced should be reduced and those which deserved to be expanded should be expanded. Comrade Zihui and the Rural Work Department of the CCP Central Committee earnestly implemented the above-mentioned directive. They carried out rectification and consolidation work among the 670,000 cooperatives throughout the country, of which 650,000 cooperatives were preserved and 20,000 cooperatives were disbanded. Later it was said that "200,000 cooperatives were disbanded." This was not a fact. This rectification overcame the tendencies toward rashness and impetuosity, relaxed the strained rural situation and sparked the enthusiasm of the broad masses of peasants to a certain extent.

On the question of the speed of agricultural cooperativization, in May 1955, when discussing plans to develop cooperativization, Comrade Zihui maintained that cooperativization should be popularized step by step. He also held that attention should be paid to its consolidation, and it should be developed in accordance with the CCP Central Committee's original plans instead of being developed excessively at an unduly rapid pace. Doing things in such a way seemed to be a bit slow, but, in fact, from a long-term point of view, it would be faster and make better progress. Later these correct proposals were subjected to criticism.

After being criticized, Comrade Zihui still threw himself with great zeal into the work of consolidating agricultural collectivization. He especially stressed upholding the principle of voluntary participation and mutual benefit, maintaining that the heart of the matter was to correctly treat the middle peasants and to establish an alliance of the poor and middle peasants; he stressed not discriminating against the peasants still farming on their own and maintaining that only when the interests of the majority of the peasants were protected and developed, could we enjoy their support. He paid close attention to doing a good job in the operation and management of cooperatives, to rectifying their financial affairs, and to ensuring increases both in production and income of cooperative members. Together with the comrades of the Rural Work Department of the CCP Central Committee, and on behalf of the CCP Central Committee, he drafted a series of directives and documents concerning the consolidation of agricultural collectivization. In October 1957, based on the summation of the experiences of various localities, he made a suggestion for practicing unified administration, graded management and a personal responsibility system with a clear division of labor and responsibility. After people's communes were organized throughout the nation, he continued to work hard for the consolidation of the collective economy. In 1960 he personally conducted investigations in the rural areas and on this basis he took charge of drafting the "forty regulations for handling the internal affairs of the people's communes." The 1961 work meeting held by the CCP Central Committee formulated the "draft regulations for the work of the rural people's communes" (that is, the "sixty regulations") by using these regulations as reference and summing up the experiences of various localities.

In the spring of 1962, he wanted to consolidate the collective economy and find ways to integrate the economic interests of the collective with those of the individual on the basis of investigations. Apart from stabilizing the system of production team ownership, respecting the decisionmaking power of the production teams, preserving small freedoms and not changing the fixed grain purchase quotas for the production teams for a number of years, he laid further stress on establishing strict production responsibility systems. He advocated that, under the premise of putting production planning, the means of production, labor and distribution under unified administration, the production teams were allowed to assign work and output to the operating groups under a contract. The latter were allowed to assign field management and some work requiring certain production skills which were not convenient for the collective to do, to individual households under a contract, by linking remuneration with output and giving rewards for fulfilling production tasks. Large-scale work was to be done collectively and small-scale work individually. This proposition was aimed at countering the serious situation at that time in which no clear responsibility was fixed and no distinction was made between those meriting rewards and those deserving punishment, and the proposition was, therefore, warmly welcomed by the peasants. The fine situation which has emerged after the introduction of various forms of the agricultural responsibility system in the rural areas of present-day China has fully proved the correctness of Comrade Zihui's assertion concerning establishing a responsibility system linking remuneration to output.

As for how to develop China's agricultural economy, Comrade Zihui also put forth a series of far-sighted propositions. He held that in order to develop agricultural production, first of all it was necessary to have a clear understanding of the basic condition of China's agriculture, of the natural resources and other conditions, and to make the best possible use of the favorable conditions and avoid the unfavorable ones. He criticized the tendency to make production unitary, and stressed the need to develop a diversified economy and all-round production in such fields as agriculture, forestry, animal husbandry, sideline occupations and fishery. He attached great importance to the work of the technological transformation of agriculture and to the enthusiastic popularization of advanced production techniques and advanced experiences in operation and management. He also advocated that technical popularization centers and operation and management centers be established throughout the nation. He advocated that in carrying out agricultural capital construction, consideration should be given to practical demands, the principle determining important and urgent demands should be practiced, things should be done within the limits of our capabilities and we should not entertain the idea that seeing that "all neglected tasks are now being undertaken" we are only "one step away from heaven."

Comrade Zihui also made outstanding contributions to establishing and developing China's agricultural scientific undertakings. At the national conference on agricultural scientific work called in December 1955, he reminded us to recognize that, after cooperativization, the peasants would inevitably require scientific assistance. He said that in developing agricultural production, besides relying on the enthusiasm of the peasants, we should rely on the use of agricultural science. Labor plus science would ensure a steady increase in production. At Comrade Zihui's suggestion, the Chinese Academy of Agricultural Sciences, various district institutes and specialized institutes of agricultural sciences were established and tens of thousands of agrotechnological personnel were trained, thus ushering in a new era in China's agricultural scientific research.

Practice over a long period of time has proved that Comrade Zihui and the Rural Work Department of the CCP Central Committee of which he was in charge remained steadfast to the socialist orientation and to the party's line, principles and policies and made remarkable achievements. His correct proposals concerning the development of China's socialist agriculture are still of significance to the modernization of agriculture.

III

Working together with Comrade Deng Zihui for a long time, I realized that he had many noble qualities and a fine work style which deserves our study and attention. Here I would like to list some of his characteristics which left fairly deep impressions on me.

Comrade Zihui raised his understanding of the mass viewpoint and mass line to the higher plane of party spirit and then put them into practice. He was a model of our party in enthusiastically upholding the mass viewpoint and mass line. He always taught the cadres to get deeply involved with the masses, understand them and foster the idea of serving the people wholeheartedly, doing everything for the people and relying on the people in doing everything. He said: "Going all out to mobilize the masses is the basic line of the party in leading the revolution and the only way for the masses to achieve victory in the revolution and self-emancipation." Every party member and every revolutionary should have the mass viewpoint. This is "the basic content of the party spirit."

He held that whether waging revolution or carrying out construction, we should rely on the consciousness, wishes and voluntary participation of the masses of people instead of having the mentality of acting and considering oneself clever and practicing subjectivism and commandism. As long as we take the mass line and consult with the masses when matters arise, we will become wiser in doing things. When considering policy issues involving the interests of the masses, he always reminded us to "take the more important one in weighing up two advantageous measures and take the less harmful one in weighing up two disadvantageous measures." He asked us to maintain wide and close ties with the masses, listen attentively to the voice of the masses, acquaint ourselves with the weal and woe and the urgent demands of the masses, and really find out where their interests lay. To achieve this, the basic thing was for our comrades to live like the masses and "rather than having privileges, their words, deeds, clothing, housing and food should be in a common style." In this way, the masses would dare to approach us and be willing to tell us what was on their minds. In work over a long period of time, he himself was best at doing mass work, at maintaining close ties with the masses, at having a true understanding of the demands of the masses and using the language of the masses to explain to them the party's views and policies.

Another outstanding characteristic of Comrade Zihui's was that in doing everything he laid stress on investigation and study, proceeded in everything from reality and sought truth from facts. These strong points of his took shape when he was in western Fujian during the agrarian revolution. By conducting profound investigation and study and summing up the experiences of the masses, he reached the conclusion: "take from those who have too much and give to those who have too little; take from the fat to pad the lean." This conclusion and the conclusion reached by Comrade Mao Zedong from the investigations he conducted in Xingguo coincided. For this, Comrade Zihui was praised by Comrade Mao Zedong. Later, when he was in northern Jiangsu, central China and Shandong Province, in working in various fields, he took investigation and study as a means to find a way and as the foundation for formulating principles and policies.

During the stages of socialist revolution and socialist construction, as usual, he preserved this fine work style. He was praised by Comrade Mao Zedong three times. The first time was in 1957. On the basis of investigations and study, he drafted the directives and documents concerning the consolidation of the agricultural collective economy for the CCP Central Committee. Comrade Mao Zedong praised him for his method in doing this work, namely, to proceed from reality. The second time was in March 1962, when a work conference was convened in Guangzhou by the CCP Central Committee. After the "sixty regulations" were discussed at the meeting, Comrade Mao Zedong said at the meeting that our revered Comrade Deng had done a good thing in formulating the "sixty regulations." He had the spirit of conducting investigations and study and his views were correct. The third time was when, after the Guangzhou conference, he was entrusted by Comrade Mao Zedong and Comrade Liu Shaoqi to determine the problems of the rural basic accounting units. He returned to Fujian Province to conduct investigations and carry out experimental work, and then wrote "an investigative report concerning the experimental work of the basic accounting units of the people's communes" in which he formulated solutions to some concrete problems arising after production teams were made the basic accounting units. When he read the report, Comrade Mao Zedong was very happy and wrote instructions for it to be issued throughout the country. The instructions read: "This report of Comrade Deng Zihui's is very good. It is sent to you for your reference"; "Conducting serious investigations and study and making a concrete analysis of concrete conditions instead of an abstract and subjective analysis are the soul of Marxism"; "First secretaries of various provinces are encouraged to lead some working groups and go, adopting the method of Comrade Deng Zihui's, to the countryside to do investigation work and study for about 10 days." He was still ready to accept the views of other people, views stemming from practical work, and modestly learn from the creativity of the masses. When the production responsibility system was proposed in 1962, it was he who was the first to receive a letter written by a grassroots cadre in Anhui Province. He sent out a working group and after the system was proved to be effective through repeated investigations and studies, he proposed this method to the CCP Central Committee. His thoughts, views and assertions were often fairly suited to reality thanks to the importance he attached to investigation and study.

In handling the relationship between the individual and the party, Comrade Zihui was a model who upheld principles and observed discipline. He could withstand the tests of both favorable and adverse circumstances. In all circumstances, he always struggled arduously and made unremitting efforts to improve himself. He dared to practice criticism and self-criticism. Strict in analyzing himself ideologically, he would criticize himself in public without scruple if he found he had made mistakes. When he was unjustly criticized, he could take the interests of the whole into account, hold back his grievances for the sake of shouldering more important tasks, safeguard the unity of the party and never shirk responsibility. But on the question of principle involving the fundamental interests of the people, he would never yield. Conscious of dangers, he would give no thought to personal gain or loss, but instead would report and make suggestions to the CCP Central Committee and ask it for instructions according to the rules and regulations of the party. He was open and aboveboard as well as very sincere, and he never concealed his views.

Comrade Zihui also had the spirit of using his own hands and starting, in doing everything, from small matters. He personally compiled a "Rural Accounting Textbook." Together with us, he studied such problems as agricultural scientific research and education, the popularization of technology, the grain cropping system, the diversified economy, the development of pig raising and animal husbandry, river control and water and soil conservation, and construction in mountainous areas. Even in his last few years, he indefatigably studied the rural "insurance system for farm cattle" so as to ease the burden on the peasants.

All this fully shows that he was boundlessly loyal to the cause of the party and the people and to Marxism-Leninism-Mao Zedong Thought. Comrade Zihui proved himself to be a Marxist who integrated theory with practice.

HOW SHOULD WE LOOK AT THE QUESTION OF MARKET PRICES AT PRESENT?

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 33-36

[Article by Liu Zhuofu [0491 0587 3940], director of the State Administration of Commodity Prices]

[Text] In the government report delivered at the 4th session of the 5th NPC, Premier Zhao Ziyang said that commodity prices in 1981 were mainly stable. Comparing 1981 to 1980, he said, the rise in the general price index has been smaller. Prices of daily-use goods have been kept stable. However, the prices of some items have risen. These words summarized realistically the general situation of our market prices in 1981.

First of all, the situation of market prices in 1981 was better than that of the previous year.

Regarding the price index, from January to September 1981, the general social retail price index rose by 1.1 percent as compared with the same period of the year before. Within this figure, the state-fixed prices rose by 0.9 percent; negotiated prices rose by 1.6 percent; and fair market prices rose by 5.3 percent. It is estimated that the general retail index for the whole year rose by 2 percent, which takes into account the price rise of cigarettes and wine, while the same index rose by 6 percent in 1980. Of course, owing to various complicated factors, the index cannot exactly reflect the real situation of price changes. For example, the index cannot reflect such phenomena as disguised price hikes and random charges. After prices of eight categories of nonstaple foodstuffs were raised in 1980, the repercussions of a chain reaction were quite strong; besides, the range of commodities which can be negotiated had not been well defined, adding such problems as hikes in negotiated prices and sporadic price hikes for a period of time. For this reason, the State Council issued the "circular on stringent control of prices and rectification of negotiated prices," which enforced a price freeze on all consumer goods and called for a nationwide price inspection. In this way, sporadic price hikes were brought to an end and prices were kept basically stable. In the first half of 1981, the general retail price index rose by only 0.7 percent. The masses were rather satisfied with this. However, in the latter half of the year, vegetable prices were raised. Then the state adjusted the prices of some commodities, and some of the fair market prices also rose. All this contributed to raising the price index in the latter half of 1981, which is expected to be larger than that in the first half. However, viewing the entire year and all aspects, it is certain that the rise in the price index in 1981 was smaller than the rise in 1980.

Second, some prices did rise; hence the masses were further burdened.

The retail price rise in 1981 can be divided into three parts.

The first part is the price rises approved by the State Council. There are two such groups in this first part. One group was approved around the second quarter. Among those, the selling prices of bamboo, wooden and leather products were raised. The reason for these price rises was that the former purchasing prices for timber, bamboo, cowhide and sheepskin were on the low side. However, after raising the purchase prices proportionally, the production of finished products from these raw materials incurred financial losses, so that the output of the products decreased; some of them even became in short supply. Therefore, it was necessary to raise the prices of finished products, which spurred the development of production and better met the needs of the masses. The other group included cigarettes and wines, the prices of which were raised recently. While deciding to raise the prices of these two groups of commodities, the State Council lowered the prices of other items. Among them, there were polyester cloth, nylon socks, rubber-soled shoes, electric meters for civil use, electric fans, television sets, recorders, magnetic tapes, digital watches, refrigerators, as well as honey, walnuts and so on. In general, both the increases and decreases occurred in commodity prices. In the main, the amount of price rises for industrial products was equal to that of price decreases. Both price rises and price decreases totaled over 300 million yuan. Adding the price rise of cigarettes and wine and the price decrease of polyester cloth, the total amount of price rises was a bit larger than the total amount of price decreases. However, the commodities whose prices were raised are daily-use consumer goods; and the commodities whose prices were lowered are only bought by a small portion of the people, or are not bought frequently by most of the people, so that the broad masses of consumers did not readily feel the effect of the lowered prices. As a result, the impression of price hikes ran deeply among the masses.

The second part of the price rises came from enterprises which raised the prices of their products without authorization. This was mainly reflected in all kinds of disguised price hikes and random charges. In the course of implementing the economic responsibility system and after linking bonuses with profits, the administration and supervision systems did not keep up with the changes, so that the problem became more pronounced. By means of raising prices without authorization and making disguised price hikes and random charges, some enterprises and institutions increased their profits in order to distribute more bonuses. Besides, owing to the unhealthy tendency of "entering through the backdoor," well-made inexpensive commodities were first sold to friends, relatives and the so-called "related units," thus further adding the burden on the broad masses of consumers.

The third part of the price rises came from market trading. Shortages of some commodities traded in this way resulted in price rises. Prices of other items were hiked by shops. All this causes the expenses of urban residents to increase.

However, in the urban areas, it was the rise in nonstaple foodstuff prices that aroused the most complaints from the masses and affected them the most. The vegetable price rise in particular drew the loudest complaints from the masses, despite the state's increasing vegetable price subsidies year after year. In 1979, the state give a subsidy of 240 million yuan; in 1980, 310 million yuan; and in 1981, more than 400 million yuan. For vegetables, the masses had to pay more, and the state had to give more subsidies, but the supply did not improve. This was owing to problems in production and management. The shortage of commodities at state-fixed prices was another reason for the rise in price of nonstaple foodstuffs. The masses were thus obliged to buy more commodities at negotiated prices or at fair market prices. In some towns, most of the pork was supplied by individual retailers, since state-owned shops only supplied a very limited amount. Among vegetables, poultry, eggs and aquatic products, those bought at negotiated prices or in market fairs accounted for a substantially large proportion. The departments concerned are planning a special meeting to find solutions to the above problems.

While finding that the prices of some commodities did rise and that the masses were greatly affected, we should also note other aspects. Comparing 1981 with 1978, the peasants' income increased by over 18 billion yuan owing to increases in state purchasing prices for agricultural and sideline products. Cash wages (including bonuses and subsidies) of staff and workers in units owned by the whole people were 24.7 percent higher in 1980 than in 1978, while prices rose by 10.1 percent over those of the same period. Even if disguised price hikes and other factors are taken into account, viewing the country as a whole, wages rose much more than prices. Therefore, looking at the people's livelihood in an all-round way, we should say that prices have risen in recent years and the masses have had to pay more, but workers' wages have also increased and, moreover, they have risen more than the increase in expenditures, so that the people's standard of living has improved. Of course, there is still some imbalance. Families which have more people employed, had their wages increased and had more bonuses had a more improved standard of living, and they constituted the majority. On the other hand, families which did not have such benefits felt the price rises much more, their standard of living did not actually improve, and some suffered a decline in the standard. These people are mainly personnel who work in government organs and who work in scientific, cultural, educational and medical-health institutions. Finance Minister Wang Bingqian said in his report at the 4th session of the 5th NPC that the state is planning to readjust the wages for staff and workers in departments which do not adopt the bonus system.

Here, it is necessary to say something about price subsidies. Although the state still has many financial difficulties, a subsidy system has been in effect for many years for people's daily-use goods and agricultural products in order to stabilize market prices. Particularly in the past 2 years, while the state purchasing prices for agricultural and sideline products were raised, selling prices for grain, cotton and oil were still maintained. Thus the state had to increase price subsidies year after year: in 1978, the subsidies amounted to 7.8 billion yuan; in 1979, 14.6 billion yuan; in 1980, 20.8 billion yuan; and in 1981, it is expected to be over 32 billion yuan. Among the total subsidies in 1981, subsidies for grain, cotton and oil accounted for 22.8 billion yuan; those for meat, fish, eggs, sugar, vegetables and domestic coal accounted for 2.8 billion yuan; and those for chemical fertilizer, pesticide, diesel oil for farm use, electricity for farm use and farm machinery accounted for 4.5 billion yuan. This fully shows that the state has spent a lot of money in order to ensure stability in the people's livelihood.

At present, many people are concerned about the price decrease of polyester cloth and the price rise of cigarettes and wine. So it is necessary to give a further explanation here.

It was after careful consideration that the State Council decided to lower the price of polyester cloth and to raise the price of cigarettes and wine. The polyester cloth price decrease was mainly for the purpose of expanding sales, reducing stockpiles, promoting production and improving people's clothing. By raising the price of cigarettes and wine, it was intended on one hand to cover the increased cost caused by the price rise in raw materials, and on the other hand to increase revenue and help overcome the current financial difficulties.

It was planned to lower the price of polyester cloth by 0.66 yuan per meter, but as the result of actual implementation, the price was lowered by about 0.70 yuan per meter. Among the cigarettes and wine, the prices of those of high quality and of well-known brands were raised much higher, but prices were raised less or held level for those of intermediate or low quality and those which already had rather high prices. Considering the retail price rise within the whole country, prices of the grade A cigarettes were raised on an average by 0.27 yuan per pack. Among them, the prices of some well-known brands like Zhonghua produced in Shanghai and Yunyian in Yunnan were raised by 0.50 yuan; prices of grade B were raised on an average by 0.08 yuan per pack, but the well-known Qianmen and Hengda brands were raised by over 0.10 yuan; prices of the grade C were raised by 0.02 yuan, and some of good quality were raised by 0.05 to 0.06 yuan; and prices of grades D and E were held level. Prices of well-known white wines were raised by 2 yuan per jin, bulk grain wine prices were raised by 0.05 to 0.20 yuan per jin, bulk standard beer prices were raised by about 0.16 yuan, bulk yellow wines were raised proportionally, bottled wines prices were raised correspondingly, but potato wine prices were held level. The range of price rises varied according to locality. Some were higher than the national average, others were lower.

While the prices of polyester cloth, cigarettes and wines were being adjusted, a small number of provinces and municipalities also increased the prices of several kinds of commodities. The price adjustment of these commodities had generally been previously approved by the State Council. Most localities had finished this adjustment one after another several months earlier. So it cannot be said that those few provinces and municipalities which had not finished this price adjustment used this opportunity to hike the prices of more commodities. However, some localities have not done enough propaganda and explanation among the masses to get them to understand the reasons for adjusting the prices of more commodities, hence there were misunderstanding and complaints among the masses for a time. This should be taken as a lesson for future work.

There are quite a number of people who worry that the prices of other commodities will be hiked following the latest rise in cigarette and wine prices, thus starting an upward trend.

As prices of the eight categories of nonstaple foodstuffs were raised the year before, the chain reaction and random expansion of negotiated prices were not well controlled. This shortcoming in our work remains fresh in people's minds, and their misgivings are understandable. However, it can be clearly stated that the latest price rises in cigarettes and wine will not lead to such a situation. This is because cigarettes and wine are finished products and are different from the eight categories of nonstaple foodstuffs, which are both direct consumer goods and also the raw materials for some consumer goods. Therefore, the rise in cigarettes and wine prices will not cause a chain reaction among other commodities whose prices are fixed by the state. While deciding to raise the prices of cigarettes and wine, the State Council also gave instructions to all departments and localities to strictly control prices and to prevent prices from being hiked randomly.

It should be pointed out that, before the state can reform the structure of wages and prices in an all-round way, keeping market prices stable, in the main, is the most important task in pricing work. Only under the premise that the stability of prices can be ensured and both the increase and decrease of the prices are arranged, can the adjustment of a small number of commodities be made step by step in a planned way. Premier Zhao Ziyang pointed out that, after the price rise in cigarettes and wine, stringent measures should be adopted to maintain price stability. He said that retail prices under the control of the State Council or its subordinate departments cannot be raised without the approval of the State Council, even if the existing prices are irrational. It should be made a matter of discipline. In any case, retail prices should be kept stable. As for problems concerning administered prices and the relations between different industrial departments or between the industrial and commercial departments, solutions should be reached by the leading organs concerned after due consideration, and afterward, no market price can be changed. The pricing departments must be determined to cooperate with industrial, agricultural, commercial and market administrative departments in effectively maintaining the stability of market prices. The following are specific measures to be implemented:

1. Conscientiously straighten out and stabilize the state purchasing prices for agricultural products. Since the 3d Plenary Session of the 11th CCP

Central Committee, the purchasing prices for the agricultural products have risen by 35 percent. There has already been a very great improvement in the situation of prices being too low for agricultural and sideline products. According to the current financial and material capacity of the state, and looking at the rate of development of agricultural production in recent years, it can be said that the current levels of purchasing prices for agricultural products conform to the current needs in the readjustment of the national economy. Prices can no longer be used to arouse the peasants' enthusiasm. We should rely on the development of production instead of price rises to make peasants prosperous. A correct price policy can bring about production growth, but improper price rises can harm production, harm the price relations between different agricultural products and between industrial and agricultural products, so that the coordinated development of the entire national economy will be affected. It must be seen that price rises only relate to the distribution of the national income and cannot create any social wealth. Under the present circumstances, if the purchasing prices for agricultural products are further raised, the state can only add to its financial deficit and issue more banknotes, inevitably causing price hikes, which will not only make the workers suffer but also make the peasants lose their benefits from purchasing price rises. Therefore, we must be determined to keep the purchasing prices for agricultural and sideline products stable over the next few years. The income of the broad masses of peasants, which conforms to the policies, should be protected; but random practice of some localities and departments, which violate state policies to expand the variety of commodities with negotiated or increased prices, to hike the negotiated prices and to cut the purchasing base quotas, should all be rectified conscientiously. The principles of giving consideration to all the interests of the state, the producers and the consumers and consolidating the worker-peasant alliance should be clearly explained to the cadres and the peasants, so as to stabilize, above all, the purchasing prices for agricultural and sideline products.

2. The adjustment of planned prices must be strictly controlled. While we tackle the small number of extremely irrational prices, the internal prices for settling accounts should be lowered as far as possible, or the taxes and profit distribution between enterprises can be readjusted. Product price adjustments, which will directly or indirectly cause a rise in market retail prices, should be strictly controlled. The financial losses of enterprises can be stopped mainly by improving management, reducing costs and cutting down circulating expenses. At present, there is a great potential in these respects, and a great deal of work can be done to accomplish these things.

3. It is necessary to resolutely stabilize the prices of basic necessities. There must be no rise in the prices of staple and nonstaple foods, cotton cloth, domestic coal, salt and other items supplied by ration or in exchange for coupons. Financial losses which occur in the handling of these items should continue to be covered by subsidies.

4. It is necessary to stabilize the prices of popular vegetables. It is essential that the leading comrades in large and medium-sized cities and in industrial and mining areas give their personal attention to this problem.

Planting and purchasing of vegetables must be done in a planned way. Problems concerning the production orientation of the peasants in suburban areas should be solved. The contradiction in the communes and production brigades between their industrial and sideline production on one hand and their vegetable production on the other should be carefully and properly handled. This requires that every locality and department do a great deal of work.

5. It is necessary to enact economic legislation and strengthen price controls. A pricing law is now being drafted. Inspection and supervision over commodity prices should be further strengthened. Industrial and commercial enterprises must straighten out ideas and styles of operation. Every locality should effectively strengthen the forces administering and supervising prices at the grassroots level. Particularly in the large and medium-sized cities, towns, industrial and commercial enterprises, there must be competent personnel in charge of price control. They should, by relying on the masses, frequently inspect and supervise market prices.

At present, there are many rumors being spread in society about prices. For example, it has been said that "the price of flour will be hiked; grain coupons will not be necessary"; "no cloth coupons will be issued from 1982 on"; "there will be an all-round hike in prices, everybody will be subsidized by a few yuan"; and so on. All these groundless rumors should never be given any credence.

The price problem is a comprehensive reflection of the national economy. To stabilize market prices is a task jointly shared by all departments concerned (including production, planning, commercial, financial, industrial and commercial administrative departments). Governments at all levels must mobilize their forces, by relying on the masses and pooling their wisdom and efforts, to bring prices under control in a comprehensive way. The fundamental way to stabilize market prices lies in developing production, lowering costs, achieving financial balance, controlling money supply and increasing consumer goods suited to the market. Premier Zhao Ziyang raised 10 important principles for economic construction; the people all over the country are striving for a fundamental improvement in the state's finance and economy. Without a doubt the prospects for our economic development will be better and better. Under the leadership of the party and the government, with the coordination and joint efforts of all departments, we are bound to be able to continue to keep market prices basically stable.

ACT IN ACCORDANCE WITH THE EDUCATION LAWS AND IMPROVE THE QUALITY OF TEACHING IN AN ALL-ROUND WAY

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 37-40

[Article by Wen Hanjiang [3306 1383 3068]]

[Text]

I

When we implement the eight-character policy in educational work, we must in the first place do a good job of readjustment, and we must also pay attention to the improvement of quality on the basis of rectification and restoration. Therefore, reviewing and summing up the experience of teaching practice over the past 32 years, studying the laws governing educational work in the new situation, and studying how to further improve the quality of teaching are very important tasks facing schools.

Over many years, in our teaching work we have paid attention to imparting knowledge and applying relevant theories, principles and methods of teaching to teach basic knowledge and skills. The actual results have been rather good, the quality of teaching has markedly improved and tens of thousands of personnel have been trained to serve the state's needs. Practice has proved that it is absolutely correct to stress basic knowledge and basic skills (abbreviated as the "two basics" below) in teaching. During the decade of internal disorder, the quality of teaching drastically deteriorated because basic knowledge and theories were done away with to a great extent and people vigorously carried out "open-door schooling" and "substituting action for study." This negative experience also testifies to the necessity and correctness of vigorously grasping the "two basics."

However, nowadays, science and technology develops at a tremendous pace, and scientific and technological knowledge changes with each passing day. If we only pay attention to the imparting of knowledge in teaching and students only master and memorize the theories and knowledge built up and summed up by their predecessors, without acquiring the ability to independently apply their knowledge to solve problems, then in their future work they will find it difficult to master new theories and knowledge which develop continuously, and therefore they will be unable to solve new problems. Past experience in teaching has also told us that although some students get high marks, they will find studying very difficult when they study more advanced things or when they enter institutes of higher learning. Some students acquire a great deal of knowledge in school. However, after graduation they show poor adaptability in work. This is because, over many years in our teaching work, we have paid attention to the imparting of knowledge alone, at the expense of the fostering of their ability. Therefore, we must fully develop the students' intellectual ability, cognitive ability and ability to analyze and solve problems. Only thus will the needs of the cause of socialism be met.

We must not only impart knowledge to students and foster their ability, but, what is more important, we must train them to be new people who are both Red and expert and who are fully developed morally, intellectually and physically. Therefore, it is an important task in teaching to provide ideological and political education so that the students gradually acquire a proletarian world outlook and so that their communist moral qualities are fostered. In the past, although we paid attention to ideological education in teaching, our work was often divorced from reality and marked by leftist and rightist deviations. For example, in the past, under the influence of the "leftist" ideology, we neglected or did away with the teaching of basic knowledge, unrealistically providing so-called ideological education, which was as superficial as putting on shoes and hats. We stressed the teaching of viewpoints and theories at the expense of educating students through gradual, uplifting and subtle influences. We stressed teaching by preaching at the expense of teaching by example, and so on. Since the smashing of the "gang of four," there has been a tendency to stress the teaching of the "two basics" at the expense of ideological and political education, with students being taught knowledge without being educated as persons. In recent years, we have one-sidedly gone after promotion rates and marks at the expense of full moral, intellectual and physical development. There has been a growing tendency to stress the training of a minority of students to be the "elite" at the expense of catering to the needs of all the students. All this is against our party's educational policy and is disadvantageous to the training of a large number of qualified personnel. Recently, thanks to the concern and guidance of the CCP Central Committee, the education departments at various levels have adopted effective measures to implement the educational policy of enabling students to develop in an all-round way--morally, intellectually and physically. They have stressed catering to all students and have strengthened ideological and political education for young students. This is a good start in improving the quality of teaching in an all-round way. Teaching is the main work of a school. Integrating ideological and political education with teaching is an important aspect of the moral education in schools. Therefore, we must correct our understanding of ideological education, sum up both positive and negative experiences, put an end to the slackness in our current ideological and political work, and conscientiously strengthen the ideological and political education of students.

In short, at present, when we stress the improvement of the quality of teaching, we must not be content with satisfactorily teaching the "two basics." We must further free our thinking from old ideas, study the new situation and new problems facing us in educational work, and vigorously discover objective laws of education. While doing a good job in grasping the teaching of the "two basics," we must also vigorously develop the students' intellectual ability and their revolutionary ideological qualities. We must flexibly integrate the three tasks of teaching the "two basics," fostering the students' abilities and providing ideological education. We must clearly understand the laws governing the development of each task and the interrelationships between these laws, and improve the quality of teaching in an all-round way.

II

Basically, fostering ability means fostering a capacity to understand and transform the world. Fostering the young students' ability mainly means fostering their ability to independently master and apply knowledge in the learning process, that is, to enable them to acquire the ability to creatively apply their knowledge.

Mastering knowledge is closely related to fostering ability. The two promote each other. In mastering knowledge, a student must convert the knowledge acquired by his predecessors into his own spiritual wealth. This conversion process must be accomplished through his own cognitive activity. The development of his ability (cognitive ability) will be favorable to his mastering of knowledge. If his ability is not developed, the knowledge he masters will be mechanical and lifeless. On the other hand, his ability is developed precisely through the learning process. If he departs from the basis of acquiring knowledge, the fostering of ability will become empty talk. Therefore, knowledge is the basis for the development of ability, and conversely, ability can promote the learning of knowledge. It is a one-sided and incorrect view to hold that it is unnecessary to pay attention to the fostering of ability if one can acquire solid knowledge, or to hold that the acquisition of knowledge is not very important, the principal task being the fostering of intellectual ability.

In fostering students' abilities and developing their intellectual ability, what principles of teaching must be followed? What are the characteristics of the things to be taught and the characteristics of the methods and forms of teaching? These important questions must be conscientiously studied.

In this era of rapid development of science and technology and new branches of learning, it is impossible for a person to master all kinds of knowledge or master all the knowledge contained in a specified branch of learning. School education can only help the students build a foundation which will enable them, in their work after graduation, to further independently master and apply new knowledge and study and solve new problems. In the common expression, the purpose of school education is to enable them to "draw inferences about other cases from one case."

In school, students must study various subjects and master extensive and rich knowledge in various branches of learning. In order to foster the students' ability and enable them to "draw inferences about other cases from one case," we must set this "one case" against the extensive sea of knowledge, so that students can understand complicated phenomena by applying simple principles and comprehend things by analogy. Therefore, in teaching we must distinguish general knowledge from key knowledge. In the light of the theory of the "structure of knowledge" put forth by the American psychologist (Bruner) [Buluna 1580 7627 4780], and also in the light of what we have learned from our teaching practice, in teaching extensive knowledge we must stress basic concepts, basic principles and ways of thinking.

The basic concepts and principles of a subject reflect a concentrated expression of the knowledge on this subject. That is, they reflect the internal relations and essential characteristics of the knowledge on this subject. All the knowledge on this subject can be explained in terms of these basic concepts and principles. For example, various phenomena in classical mechanics can be explained in terms of the basic concepts (velocity, acceleration, force, momentum, power, energy and so on) and the basic principles (the three laws of motion and the law of gravity) of mechanics.

In teaching, we not only must give the students the fruit of our predecessors' study and research, so that they know "what," but also must enable them to understand "why" and know "how" the knowledge is derived. Therefore, when teachers teach the students basic concepts and principles, they must also teach them ways of thinking. By ways of thinking, we mean how concepts are formed, how principles and principal formulas are derived, how sentences and paragraphs in articles are arranged, how to analyze problems and what steps to take in solving them--even the structure and systematic aspect of a unit of teaching material or a branch of learning--and so on. If students are taught ways of thinking, they will more thoroughly understand the derivation and significance of concepts and principles, how the understanding of concepts and principles has been extended and deepened, and also the laws governing the relationships between various concepts and principles. Thus, the knowledge in the students' heads will be systematic and living instead of patchy and rigid, and can be more easily memorized.

Actually, teaching is a process in which students, under the teachers' guidance, systematically acquire knowledge and gradually understand the objective world. In this process, the students master and apply knowledge and undergo two "changes," namely, from not knowing to knowing, and from knowing to application. These changes are basically the same as the two leaps in the process of cognition that mankind undergoes, although there are also some differences. The main difference is that the two changes occur under the teachers' guidance, and they do not arise from the students' independent process of exploration and creation.

The theory of knowledge tells us that the dynamic role of cognition is reflected in the two leaps in the cognitive process. Cognition is based on practice, and its key significance lies in the creative ability of thinking. In order to bring the dynamic role of cognition into play and to foster the students' ability in our teaching, we must not only lead them to relate what they learn to the realities in their learning process, but also highlight the role of thinking and vigorously enable the two "changes" to occur. Often there are two completely different teaching methods. The first is the spoon-feeding method, whereby "teachers lecture and students listen." Instead of students playing a leading role, the teacher monopolizes everything and deprives the students of their opportunity to play their role. The students' brains serve as flasks for holding knowledge. Thus, in acquiring knowledge, the students only lap up information without digesting it and just memorize it mechanically. In applying what they have learned, they only mechanically apply formulas, just like drawing a tiger after a cat's image. This teaching method inevitably makes students learn without thinking. It is contrary to the law of cognition. Although the students can acquire a definite amount of knowledge in this way, this knowledge remains lifeless and rigid in their brains, and therefore their ability is poor. The other teaching method is that of elicitation. The teacher mainly inspires his students to think actively and learn on their own initiative. The teacher plays a leading role by adeptly stimulating the students' interest in learning, inducing them to think according to correct thought processes, and inspiring them to explore, think over and study new knowledge and problems in the spirit of seeking truth. This teaching method is geared to the two changes in the learning process and brings the role of thinking and the dynamic role of cognition into play, so that learning and thinking are closely integrated. This is compatible with the law of cognition. Therefore, the knowledge acquired by students in this way is living knowledge which can promote the development of their creative thinking ability.

The students' learning activities are mainly carried out in certain specified places, namely, the classrooms. Classroom teaching is the basic form of teaching. It is a shortcut to the acquisition by students of the extremely abundant spiritual wealth built up by our predecessors. It makes it unnecessary for the students, in inheriting their predecessors' scientific and cultural knowledge, to undergo once again the long, tortuous and complicated processes which their predecessors underwent in exploring and discovering truths. Therefore, it is correct to grasp the central link of classroom teaching when we want to improve the quality of teaching. However, we must note that in classroom teaching, learning activities such as listening (to lectures), reading (books), performing (experiments), doing exercises and so on are conducted under the teacher's guidance. The correct teaching method can inspire students to think actively and arouse their enthusiasm for learning. However, in the same class, various students differ in their personal interests, inclinations, abilities and skills. Classroom teaching caters to the whole class and is mainly for grasping things common to all students, and therefore it is difficult to genuinely pay special attention to individual students and teach every student individually according to his aptitude. Thus, in developing the students' intellectual abilities and fostering their ability, classroom teaching is limited in its effectiveness. Therefore, aside from doing a good job of grasping the central link of classroom teaching, we must also vigorously start various kinds of extracurricular learning activities. Aside from compulsory common core courses, we must more vigorously run electives and various kinds of seminars so that senior middle and college students can take courses suited to their own personal circumstances and inclinations. Thus they can independently carry out reading of extracurricular materials, independent study, experimentation, practical work and creative projects. We must also develop on an extensive scale various categories of academic groups, science and technology groups, literature and art groups, physical training groups and so on, so that through group activities, students can use their own brains and hands to develop their own personal inclinations and skills. This kind of all-round development will help foster their ability to discern, present, analyze and solve problems.

III

Incorporating ideological and political education into teaching is a means of fostering, by means of political subjects and the teaching of various other subjects, the students' proletarian world outlook and communist moral qualities on the basis of acquiring and mastering knowledge. In a class society, the kind of intellectual education that does not bear the mark of any class is nonexistent. The system of knowledge in a subject invariably gives expression to some definite philosophical system and ideological viewpoints. For example, in the teaching of natural sciences, courses in mathematics, physics, chemistry, biology and so on enable students to understand the laws of movement in nature, so that they gradually acquire the dialectical materialist ideology. History and geography help educate students in patriotism and historical materialism through making known to them our motherland's ancient history, vast territory and abundant resources. Therefore, ideological education and the imparting of knowledge are interrelated and each merges into the other. Academic education and moral education are closely integrated and are unified. This is one characteristic of knowledge itself. In the past, ideological education was devoid of substance and was conducted in isolation. Quotations, political terms and philosophical concepts were used as substitutes for the teaching of the "two basics." Language and history lessons were turned into political lessons. This violated the laws governing the integration of academic education with moral education. Practice has verified that this not only failed to enable students to satisfactorily acquire basic knowledge, but also failed to enable us to attain the goals of ideological education. The teenage years are a time of physical growth and growth in knowledge. Education and teaching work must be a long-term, steady undertaking. To substitute analysis of the situation for the teaching of basic theories, or to substitute political campaigns for long-term and painstaking ideological education, runs contrary to youths' physical and mental development, which is characterized by being long-term and continuous. On the other hand, we must not think that imparting knowledge is tantamount to ideological education, or even refrain from conscientiously studying how to incorporate ideological education into teaching work, on the grounds that academic education is integrated with moral education. In fact, teachers must vigorously enhance their own ideological consciousness and standard of political theory. They must conscientiously analyze their teaching material and must be adept in discovering in it elements of ideological education material, which they must understand thoroughly. They must understand the real condition of their students' ideologies and flexibly integrate the imparting of knowledge with ideological education. Only thus will the result of ideological education be good.

The process whereby students learn by virtue of our teaching is also one in which their world outlook and moral qualities develop. It is a process whereby their acquisition of knowledge, emotional development, development of willpower and behavior are unified on the basis of knowledge. Teachers must not only impart knowledge to students, but also arouse their emotions and train them to have strong willpower as well as good habits. The exposition of knowledge, the reading of poetry and prose, the appreciation of works of literature and art, and singing performances can not only enable students to acquire knowledge, but can often arouse strong, morally wholesome emotions in students, such as love for the proletariat, patriotism, fervent love for the people, the party and the socialist system, and so on. Thus, students are educated through gradual, uplifting and subtle influences. By inspiring students by vivid means of presenting images, teachers can stimulate the students' enthusiasm and interest in learning and strengthen their confidence in learning. Therefore, the fostering of emotions can promote the acquisition of knowledge. Only by integrating knowledge with emotional experience so that the two echo each other can a powerful impetus be generated. Thus, when conducting ideological education, the teachers are required to possess revolutionary sentiments. Teachers must deeply love students, carefully discover points of emotional significance in their teaching material, and blend these points with the imparting of knowledge in a natural way. Only thus can the students' lofty moral sentiments be more effectively fostered.

Moreover, thanks to the teachers' organization, guidance and rigorous demands, the students, by listening to lectures, reading books, performing experiments, doing various prescribed and extracurricular exercises, and by repeated practice, can not only master knowledge and skills in the learning process, but also be trained to have strong willpower marked by firmness, bravery and courage in the face of difficulties. They can also acquire qualities and habits such as fervent love for the collective, vigor and diligence, conscientiousness, a strong sense of responsibility, adherence to discipline and so on. These qualities and habits will further help them acquire knowledge and skills. Therefore, in teaching and learning, acquisition of knowledge, emotional development, development of willpower and behavior are dialectically unified, and the imparting of knowledge and ideological and moral education promote each other.

Young students have a strong inclination to imitate others. In the development of their ideology and moral character, the role of examples is extremely important. The teachers and students are together day after day. In the classroom, the teacher is under the observation of scores of students. The teacher's ideology, behavior and attitude toward other people--in short, every one of his words and actions--influence his students in a subtle way. Some of his actions and words will leave indelible impressions on the students' minds. Therefore, it is very important for teachers to strengthen their own moral character and strengthen self-cultivation. Teachers must not only pay attention to imparting knowledge and fostering their students' lofty moral character, but also always play an exemplary role and persist in the unity of teaching by words and teaching by example.

In teaching, the unity of academic education and moral education, the unity of acquisition of knowledge, emotional development, development of willpower and behavior, as well as the unity of teaching by words and teaching by example, can be summarized as the unity of teaching book knowledge and educating students as persons. In the past, the leftist and rightist deviations in ideological education were owing to the artificial separation of teaching book knowledge from educating students as persons, or owing to stressing only one of these two things. The vast numbers of teachers have rich experience in both teaching book knowledge and educating students as persons. At present, we must observe the laws of education, sum up the teachers' experiences, strengthen and improve ideological education in teaching, and improve the quality of teaching in an all-round way.

THE INDIVIDUALITY OF CREATION AND THE SPIRIT OF THE TIMES

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 41-44

[Article by Li Zhongyue [2621 0022 1471]]

[Text] Since the smashing of the "gang of four," and especially since the 3d Plenary Session of the 11th CCP Central Committee, the vast numbers of literary and art workers have, under the guidance of the line laid down at the third plenary session, smashed the fetters of leftist literary and artistic ideological trends, restored and fostered the realist tradition in literature and art, dared to look life in the eye, think independently, and carry out bold innovations. They have paid closer attention to using their own unique individuality of creation to reflect the objective truth of life and express people's thoughts, feelings and aspirations, thus enabling a lively scene to emerge in the field of socialist literature and art. The rapid progress that our country has achieved within just a few years in literature and art is worthy of conscientious study and scientific summation, so as to promote the even healthier development of socialist literature and art. However, we must not fail to recognize that, when it comes to the question of how to deal with certain works at present, certain individual comrades have put forth erroneous theories and views. For example, they emphasize that artists should only display "the emotions, vicissitudes and spiritual world of the individual." "They do not need to stoop so low as to act as the mouthpiece of the spirit of the times" and "they do not need to stoop so low as to show the great achievements that lie outside the world of personal emotions," and "should even avoid these by writing about the experiences and heroic struggles of characters that we have grown accustomed to and by describing scenes of selfless labor." Furthermore, they put forth this erroneous view as a "new aesthetic principle." This brings up the question of how to understand the individuality of creation, the relationship between the individuality of creation and the times, and the relationship between the individuality of creation and the reflection of the lives, struggles, thoughts and emotions of the masses. We should realize that, since this is put forth explicitly as an "aesthetic principle," it is necessary to discuss the problem of the relationship between the individuality of creation and the spirit of the times.

Does literary and art creation call for an individuality of creation on the part of the artist? The answer is yes. Literary and art creation is complicated individual mental labor. Literature and art provide a means for people to become masters of the world. Its characteristic is that of using concrete artistic images which are capable of arousing emotions to reflect the substance and generality of life. Its special point is to adopt the thinking, emotions, personality, encounters and fate of man--man who is at the center of social relationships--as the main object of understanding and description, and then, through the object described, to proceed to unfold a complicated, abundant picture of a particular time that is full of contradictions and struggles. This means that literature and art clearly possess the characteristic of sentiment. As for the source of the so-called desire to create, this is not to be found in any abstract concept or fixed theme, because it is the result of the contradictions and conflicts of life, the thoughts and emotions of characters, the generality (universality) obtained by characters from the social environment which they find themselves in and the particular character (individual style) with which they display this generality, reacting on the thoughts and emotions of the artist and eliciting strong sympathy. On the whole, in the course of creating, the artist has merely placed the object that he has described in a particular temporal, social and class environment and devoted his efforts to describing the special character of the thoughts, emotions, morals and conduct which it possesses. It is only in this way that he is able to write true-to-life, vivid and evocative artistic images, or we might say that artists can bring their description of artistic images to the level of clarity and vividness. This means that artists must bring into play what they have accumulated during their lives, proceed from their experiences in life and emotional experiences, spread the wings of their imagination, penetrate the innermost thoughts and feelings of the characters and empathize with them, so that the artists will have a deep knowledge and mastery of unity of the social substance and special character of the object described. It is precisely in the course of this vivid inner understanding and empathy that the artist, on the one hand, acquires an ever-deepening feeling for and understanding of the thoughts and emotions of characters and accurately and profoundly masters the unity of the social substance and personalities of the characters, and, on the other hand, endows his characters with some of his own thoughts, emotions, feelings and experiences (which are also restricted by a specific temporal, social and class environment). We can see that every artistic image created by an artist mirrors his own individual assessment of the social politics, morality and aesthetics of the things described by him, and these are brought out by his own unique artistic style and devices. Therefore, from content to form, works of literature and art are bound to clearly bring out the individuality of the artist. These include the artist's own individual feelings, experiences and knowledge of social life, the sum total of his own individual psychological characteristics (including personality, pastimes, interests, morals, mental qualities and cultivation), as well as his own individual way of thinking in images and mode of expression. True works of literature and art cannot help bringing out the individuality of the artist. Most narrative works are like this, not to mention the creation of lyrical works with a strong flavor of "I" (lyric poetry, lyric art, lyric music, lyric dance, lyric prose and so forth).

Since literary and art creation is inseparable from the artist's individuality of creation, what and how the artist writes must be governed by his individuality. He can only select subjects suited to his individuality and things with which he is familiar, which he truly has a unique feeling for and knowledge of and which he really is worked up about. It is only in this way that he can display his strong points and avoid his weak ones, achieve a degree of proficiency and, by calling on his wealth of imagination, create true-to-life, evocative, and original works of literature and art. The artist is best able to feel for subject matter and characters that he is interested in. What things he will be good at understanding and in respect of which he will have unique views and discoveries, and on what things he will best be able to use his artistic imagination, are not determined simply by directives from the executive or by other people's orders, but by the artist's direct or indirect experience of life, thoughts and emotions, temperament and character, cultural knowledge, aesthetic tastes and artistic values. Just as there are never two completely identical leaves in the world, so the individuality of creation varies from artist to artist. It is also precisely their uniqueness and originality, the feature that distinguishes them from others in their creation, in other words, their individuality of creation, which enables true works of literature and art to possess inimitable characteristics. They always display new discoveries and openings in life, thus enabling the world of literature and art to be eternally resplendent with brightness and color.

It can be said that all the outstanding works and lively and evocative artistic images that have emerged in large numbers in the world of socialist literature in our country in recent years were closely related to the unique feelings and knowledge of life of their authors. Characters in works about the industrial battlefront include Jiang Zilong's factory manager Qiao ("Factory Manager Qiao Assumes Office"), Zong Fuxian's and He Guofu's Luo Xingang ("Blood Is Always Hot") and Shui Yunxian's Fu Lianshan ("Domestic Strife"). Characters in works about rural life include Gao Xiaosheng's Chen Huansheng ("Chen Huansheng Goes to Town"), He Shiguang's Feng Yaoba ("On the Farm") and Zhang Yigong's Li Tongzhong ("Story of the Convict Li Tongzhong"). As for characters in works about cadres, Zhang Siyuan in "Butterfly" is radically different from Che Pengkuan in "Pioneer." As for characters in works about intellectuals, both Lu Wenting in "When One Reaches Middle Age" and Mei Puti in "Wedlock" possess their own characteristics. As for works on youth, women and armymen, these are all full of variety and differ considerably from each other in their forms. It is precisely these artistic images, which are rich in substance, that, from different angles and profiles and by reflecting certain inevitable demands made by real life concerning substance and historical development, constitute a new trend in socialist literary and art creations of the new period. Therefore, respecting and caring for the developing of the individuality of creation of artists is one of the basic premises for developing a flourishing socialist literature and art. Without the uniqueness and originality in creation of artists, there can be no true artistic creation and development.

Creation calls for individuality. However, the individuality to be found in literature and art is definitely not the manifestation of the artist's own individual subjective spirit or his own narrow "self-expression." Why? As has been said before, it is only when the artist has acquired a deep understanding and mastery of the unity of the general and specific character of the object described that he can create a clear and vivid artistic image. That is one side of the coin. The other side is that the artist's own individuality of creation is not innate, but formed and developed in the environment of a particular period, society and class. The feelings, experiences and understanding that the artist has in regard to social life, the sum total of his psychological traits, the characteristics of his thinking in images and mode of expression--all constitute the key elements of his own individuality of creation and were all formed and developed under specific social and historical conditions and through personally experienced social practice. Even the artist's individual physiological qualities and the physiological base that constitutes his individuality are not only acquired by him at birth but also acquired, developed or lost in later life under the historical conditions of society. If we separate the spirit of the times from the individuality of creation for the sake of opposing the transformation of literature and art into a mere mouthpiece of the spirit of the times, and regard literary and art creations merely as narrow "self-expression," we are bound to degenerate into the evil individualization of divorcing ourselves from the times and from the people. Furthermore, this individualization is basically not determined by the will of the individual, but by the historical development of the objective world. It will then be the product of the social phenomenon of a current going against the trend of history.

In essence, the relationship between the individuality of creation and the spirit of the times is the relationship between the subjective world and the objective world and between individuals and the community. Gorky once said, "An artist is a man who is good at refining his own subjective impression and deriving from it objective things of universal significance. He is also good at expressing his concepts in his own way." ("Gorky on Literature," compiled by Lin Huanping, p 6) An important criterion for an artist is that he must be good at expressing his concepts in his own way and, what is even more important, be good at analyzing and refining his own subjective impression, deriving from it material which conforms with reality and has the universality and significance of inevitability, and expressing it.

Undoubtedly, anything subjective is in essence a reflection of the objective. Nevertheless, not all subjective things correctly reflect the objective. Likewise, not all subjective experiences and understandings of an artist have the same value and significance. We cannot say that each subjective experience and impression of an artist or any characteristic of his subjective side is reasonable and valuable and is worthy of affirmation and manifestation. The reasonability and inevitability of individuality of creation lie exactly in that it is a concrete and unique form of reflection of the objective social contents that have universality and are of the significance of inevitability. Only if the artist's subjective experience or the difference of individuality is at the same time the unique reflection and manifestation of objective social content can it constitute the true individuality of creation. This means that it should be one's "own" unique experience and understanding and at the same time it should be able to reflect and express objective social contents of universal significance. Therefore, the value of "self" in artistic creation does not lie in showing one's unique experience and unique expression alone. What is of decisive significance is whether the unique experience and expression reflect, and to what degree they reflect, the objective reality of life, express the thoughts and feelings of the masses and embody the inevitable demands of history and the times. People who do not analyze or refine their own subjectivity, who are content with expressing their trivial desires and narrow thoughts and feelings, and who regard the individuality of creation as something purely subjective, individual and wishful, are in fact not respecting and advocating the individuality of creation. On the contrary, they are sabotaging the individuality of creation and artistic talent. This kind of "self" has nothing to do with true individuality of creation and has no objective aesthetic value no matter how loud the calls for it are or how unique the expression of it is.

The reason why the "new principle of aesthetics" is not correct is that it one-sidedly stresses an artist's "self-expression," cuts off and denies the flesh-and-blood relationship between the artist and society, the times and the people, and turns literature and art into a pure individual undertaking. Just imagine: if an artist adopts an indifferent attitude toward social life and the people's labor and struggle as being "not within the realm of self-expression" and regards them as "not requiring the least of his attention" and only seeks, and is given to "secrets of life which are embedded in the heart"--no matter whether these "secrets" in the heart are manifestations of individual subjective spirit--how can these "secrets" constitute the true individuality of creation which coincide with the times and the needs of appreciation of beauty by the masses and which remain unique to him? Since this kind of individuality excludes and is divorced from the needs of the times and the people, it unavoidably appears in obscure forms which are difficult to understand and reveal ambiguous views toward social life, blur and present illusory sentiments and adopt a wavering attitude. This so-called individuality of creation--if it can be regarded as such--is merely a pale manifestation of the lack of thoughts and of being weak in willpower and cold in feelings. It is the product of shutting oneself up in one's inner world and setting oneself apart from the people's life. This path of creation will only result in one's losing artistic vitality. If a person engaged in artistic creation adopts an indifferent attitude toward the seething real life and toward the people's struggle, thoughts and feelings, he cannot master life and participate in a struggle. He cannot even be an observer. Much less is he worthy of the name of artist!

In artistic production, it is the people's needs that play a decisive role. In the final analysis, the value and function of literature and art is to reflect the nature of life by means of individualized forms so that the people will obtain from them ideals, confidence, strength and orientation; it is to meet the people's needs of appreciation of beauty; and it is to help the people to push history forward. No matter whether an artist has realized this, the receptivity of his work always depends on whether it meets the needs of the people in a specific society. The formation of his individuality of creation can never be separated from the demands and influence of the times. The history of the development of literature and art has repeatedly proved: "The more outstanding a poet is, the more he belongs to the society in which he has been brought up and the closer is his talent's development, inclination and even characteristics linked with the historical development of the society." ("V. G. Belinskiy on Literature," p 22) On the contrary, "The moment a man's relationship with this world has reached such a state that he regards 'self' as 'the sole reality,' he has inevitably become an out-and-out pauper in thought." (G. V. Plekhanov, "A Letter Without an Address--Art and Social Life," p 274) Therefore, the strength of the individuality of creation can only come from the flesh-and-blood relationship between an artist and the times and the people. Only by placing himself in the current of the people and the times and continuously absorbing the strength of feelings and thoughts can an artist's individuality of creation become vital, profound and powerful. If a socialist artist drowns himself in a secluded corner deep in his heart of "self" and cuts himself off from the "arteries" and the "umbilical cord" of the times and the people, his talent and individuality will certainly wane and wither for lack of nourishment from the people and life, and his feelings and thoughts will certainly become radical, odd and fantastic for lack of corrections by social practice. To an artist, what is more dangerous than losing the ability of creation? In the past few years, there have been a very small number of writers who strive to use fantastic plots and write things to stimulate sensuality. Vulgar and cheap aesthetic interest and serious distortions of real life are found in their works. The reason this has occurred is that the relationship between these writers and the times and people has deviated from the cause of socialist literature and art.

We are socialist writers and artists. Serving the people and serving socialism is the firm and unshakable orientation and the sacred mission of each literary and art worker. At present, our country has entered a new historical period of carrying out overall socialist modernization. In this period, there are numerous new things and new contradictions which artists have to familiarize themselves with and study. In particular, under the present condition with numerous intricate and complex thoughts and social contradictions, writers and artists are faced with the central task of correctly understanding themselves and correctly understanding the times so that they can correctly and penetratingly reflect the times and manifest the spirit of the times. This arduous and glorious task demands that artists foster a richer and more powerful individuality which meets the needs of the times and the people. In order to achieve this, it is imperative to get deeply involved with the new life and practice, to participate in the great struggle of the masses for building the four modernizations, and to more seriously analyze our own experiences and impressions while seeking and discovering our subjective experiences and impressions of life in order to find out how much we fall short of the needs of the people and the demands of the times. In other words, in the course of reforming the objective world, we must continuously reform our own subjective world so that our individuality of creation can develop and can be improved and we can truly become the natural bearer of the spirit of the times and the people's will. This requires that artists should seriously study and grasp Marxism-Leninism-Mao Zedong Thought, and not the opposite. This should be the only correct road for the formation of a revolutionary artist's basic quality and his individuality of creation.

The people are the mother of literary and art workers. Let us "consciously draw source material, themes, plots, language, and idyllic flavor from the people's lives and nurture ourselves with the people's spirit of working with a will to create history"; we hope that the individuality of creation of artists becomes the accent of the times and the resonant echo of the people's sentiments and desires and not merely the nurse of artists' souls.

THE CYCLE OF REPRODUCTION AND THE CHARACTERISTICS OF ECONOMIC CRISES IN POSTWAR CAPITALISM

Beijing RED FLAG in Chinese No 1, 1 Jan 82 pp 45-48

[Article by Xiong Xingmei [3574 1840 5019]]

[Text] The development of basic contradictions in capitalism determines the regularity of the cyclical movement of capitalist reproduction and the inevitability of periodic eruption of economic crises. However, in the course of capitalist development, manifestations and specific forms of the periodic process in social reproduction and of economic crises varies under different historic conditions. Since World War II, the scientific and technological revolution has greatly developed. It has brought about tremendous changes in the national economic structure in many capitalist countries. Nonproductive economic sectors have expanded; economic relations among states or among groups of states have grown rapidly. At the same time, the major capitalist states have strengthened their intervention in the economy. In particular, they have tried by all possible means to increase investment and consumption so as to enlarge market capacity. These new conditions exert a great influence on the supply of goods and services in contemporary capitalist society. Thus, the reproduction cycle and economic crises have different characteristics from those in the past.

The Four Stages of a Cycle Are Not as Distinct as in the Past

After a certain stage in the development of capitalism, reproduction is marked by cycles. After a crisis, through depression, recovery and upsurge, conditions for a new crisis are prepared.

Under the conditions of state monopoly capitalism, the four stages do not replace one another in a clear-cut order; the unique and distinctive characteristics of each individual stage have become vaguer than before. This is one of the new characteristics. Fluctuations between different stages are becoming smaller, with partial crises and stagnation often interrupting a certain stage. This results from the fact that states make their day-to-day (short-term) economic regulations in accordance with the development of this cycle: when the economy is brisk, by reducing the expenditure on social security and the like and by increasing taxes to increase revenue, states can concentrate funds; when depression arises, by reducing taxes and increasing social security and other government expenditures, these funds can be infused into the economy again to stimulate effective demand. If this redistribution of funds does not restrain the economy from declining, the state will further increase expenditure, implement deficit financing and artificially create purchasing power. The continual state regulation of market demands can certainly exert a huge influence on the cyclical process.

It is not easy to distinguish the stages of depression and recovery. They are often replaced by slow resergence or production fluctuations. This phenomenon mainly arises from credit expansion and other financial measures pursued by major capitalist states when the economy is tending toward a decline. Sometimes, retrenchment measures are imposed immediately after strong stimulation to prevent so-called "economic overheating." To a certain extent, this results in temporary stagnation and fluctuations which interrupt the regular interchange of different stages in a cycle. As an obvious example, in the mid-1960's, production fluctuations occurred frequently in the course of economic growth in the West European countries; unstable low speed growth and production stagnation occurred alternately after crises.

Simultaneity and Nonsimultaneity Appear Alternately in Economic Crises

In the period of nonmonopoly capitalism, along with the development of world markets and the formation of a world capitalist economic system, unified cyclical activity of capitalist reproduction was an increasingly obvious tendency. Eruptions of economic crises in major capitalist countries tended to be relatively simultaneous. After capitalism entered the monopoly stage, international capital relations were further strengthened, but crises occurring in major capitalist countries were still obviously simultaneous.

Under the conditions of contemporary capitalism, there are two important factors simultaneously playing roles in the cyclical activity of reproduction. Along with the further internationalization of production and capital, economic ties between states and areas have been strengthened to an unprecedented degree. At the same time, along with the development of state monopoly capitalism and strengthened state intervention in the economy, monopoly regulation has also continually exerted influence on the cyclical process. Both these forces influence social reproduction and give rise to the following results: On one hand, economic crises in the capitalist countries vary in all aspects--they are different in intensity, in timing and in their duration. On the other hand, in analyzing the capitalist world as a whole, unified capitalist cycles still exist and an economic crisis has not lost its universality.

After World War II, five worldwide economic crises occurred in the capitalist world.

The first crisis occurred in the early postwar period. The degree of wartime destruction in capitalist countries and their progress in reconstruction varied greatly, thus resulting in greatly different cyclical processes in capitalist reproduction. An economic crisis occurred in 1948-1949 in the United States, and in West Europe and Japan a crisis occurred in 1951-1952. All of them had the characteristics of postwar periods but they were obviously not concurrent.

The second crisis occurred in 1957-1958. It was a concurrent worldwide economic crisis which covered a broad scope.

The third occurred in the 1960's. After the upsurge of large-scale investment in fixed capital in the early 1960's, industrial production declined and a crisis-like stagnation occurred one after another in France, West Germany, Japan and Britain in the mid-1960's. In the United States, there was also production stagnation in 1966, but along with the escalation of the Vietnam war, huge amounts of military expenditure propped up the U.S. economy and postponed the eruption of the crisis until 1969. The non-simultaneity of this worldwide crisis was very pronounced.

The fourth was the economic crisis storm in 1974-1975, which was aggravated by the eruption of the oil crisis which engulfed the entire capitalist world. It was a concurrent worldwide economic crisis of the gravest degree since the big crisis in the 1930's and since the capitalist states strengthened their intervention in the economy.

The fifth crisis was reflected in the slowdown of economic growth since 1979 and the prevailing economic decline and stagnation since 1980 in the major capitalist countries. In the EEC countries, industrial production declined for four seasons running; unemployment increased sharply and chalked up postwar records. This worldwide economic crisis affects the entire West but has hit especially hard the West European countries. Its concurrency is rather noticeable.

It should be pointed out that the worldwide economic crisis is of a universal nature. During the periods of 1953-1954, 1960-1961 and 1970-1971, phenomena such as industry declining and unemployment rapidly increasing occurred in a small number of capitalist countries. But they can be considered as only partial crises.

To sum up, from the end of World War II up to now, the five worldwide economic crises in the major capitalist countries occurred in alternation concurrently and inconcurrently. Together with several partial crises, they form a united activity in the cycle of postwar capitalist reproduction.

The Impact of Economic Crises Becomes Relatively Weaker

Another characteristic of economic crises in the contemporary capitalist world is that their impact is becoming relatively weaker. No crisis as grave as the one in 1929-1933 has arisen since World War II.

In this period, although economic crises and stagnation did occur in the capitalist countries, they were not as serious as those before the war, and generally, their durations were shorter. This is mainly the result of the fact that, under the conditions of state monopoly capitalism, regulatory measures imposed by the governments not only stimulate market capacity, but also artificially create demand, thus weakening, and sometimes greatly mitigating, the impact of the crisis on the economy.

Second, the great influence of scientific and technological revolution on the cyclical nature of the economy cannot be neglected. The major capitalist states have strengthened their intervention in the economy, thus bringing about a great advance in the scientific and technological revolution. Newly developing industrial sectors have arisen one after another. These new industries do not take the same course in their development. Industrial sectors such as the war industry, space industry and nuclear power industry mainly rely on the state market, and their economic activities are relatively stable. Even in the periods of economic stagnation, chemical, petrochemical and electronics industries are still able to expand business and exports. Although the degree of their influence on the cyclical process differs, the rise and development of these new industrial sectors forces the proportion of the old sectors in the economy to shrink day by day and creates various new market demands. Thus, the effects of the economic crises have been relatively small.

In addition, owing to the great efforts by the countries to expand credit, the production of and markets for durable consumer goods have been increasingly expanded. These commodities gradually lose their values in the course of consumption. This is similar in some ways to the consumption of production equipment and machinery. But the renewal of durable consumer goods often differs in timing from the renewal of industrial fixed capital. This is conducive to mitigating the fluctuations in reproduction periods.

Furthermore, both the continuous growth of postwar international trade and the rapid development of transnational companies since the 1960's are conducive to monopoly capital expanding foreign markets abroad and to shifting crises onto others. Of course, we cannot overlook the tremendous damage many Third World countries have sustained as a result.

Finally, the nonsimultaneity of some crisis eruptions in major capitalist countries can also, to a certain extent, mitigate the impact and severity of the economic crisis.

Under the conditions of state monopoly capitalism, the impact of economic crises is becoming weaker. But this does not mean the negative effect of the overproduction crisis law relating to the basic contradictions of capitalism is tending to vanish. This negative effect manifests itself in other ways.

In contemporary capitalism, states unceasingly strengthen their anticyclical regulatory measures; monopoly organizations also greatly strengthen their control over marketing and production of some important commodities. At the same time, they improve business forecasts and correspondingly adopt new management techniques to regulate enterprise production and stocks. Under these conditions, severe overproduction seldom results in the former measures of large-scale destruction of production equipment and the discarding of commodities. It mainly manifests itself in the idleness of a large amount of production capacity. Stalin pointed out in the 1930's that the extremely low utilization of capacity had become a frequent phenomenon. Since, in state monopoly capitalism, states try by all means to expand markets and major companies also continually regulate their production and stock, there is a chronic phenomena in which the utilization of capacity is frequently and extremely low. In the periods of postwar crises, the utilization of capacity in the U.S. manufacturing industry declined to 70-80 percent; even in noncrisis years, the utilization was generally only 80-85 percent; but the amount of commodity stock was much lower than in the 1930's.

Economic Crises and Monetary Crises Erupt Simultaneously and Mix With Each Other

The most noticeable manifestation of the contemporary monetary crisis is the wide-ranging and severe inflation. On the one hand, major capitalist states have been implementing the Keynesian financial policies of expanding credit, which have resulted in increasingly severe inflation in these countries. On the other hand, money devaluation in these countries has affected their money value stability vis-a-vis other currencies. Besides this, over a long period of time, the United States took advantage of the privileged position that the U.S. dollar had gained in the world monetary system to export inflation, thus bringing about worldwide inflation.

When the gold standard came into effect in monopoly capitalism, the simultaneous eruption of economic and monetary crises often shocked the credit system and resulted in the bankruptcy of a large number of banks. In state monopoly capitalism, despite the fact that inflation has become more and more frequent and severe, and has interacted with the economic crisis as they occurred simultaneously, the banking system has not been seriously threatened. During the economic crisis of 1974-1975, bank bankruptcies occurred in the Western countries and involved some major banks in the United States and in West Europe. But the scope and severity of the crisis were far less than the financial storm in the big crisis of the 1930's. The reason that the crisis of 1974-1975 was far less intense than the crisis of the 1930's is the state's intervention in the financial industry: at that time, the central banks of the eight West European countries, the United States and Japan reached an agreement to make all efforts to rescue the commercial banks which had sunk into dire straits. At the same time, the improvement of their banking system, including the deposit insurance system, also helped a lot.

Contemporary monetary crises also take the form of international financial crises. This is reflected in the instability of the currencies of capitalist countries, first of all of the U.S. dollar, in the gradual disintegration of the international monetary system of which the U.S. dollar was at the center, and in the resulting disturbance and disorder of international financial business.

The international monetary system centering on the U.S. dollar was founded on the agreement of major capitalist states. By this arrangement, state monopoly capitalism of these countries could be united to administer and control the capitalist monetary system on a worldwide basis. Under this arrangement, the U.S. dollar functioned as the intermediary between gold and other currencies. This system was based on the condition that the United States was very strong both politically and economically. Along with the U.S. economic position declining and the appearance of its adverse balance of international payments, the U.S. dollar's status as the monetary system basis of the entire capitalist world was ruined; its gold reserves unceasingly flowed out. At the same time, along with its ceaseless devaluation, the external credit of the U.S. dollar was also shaken. Since the early 1960's, the U.S. dollar has experienced frequent crises. However, these monetary crises were not manifested in runs on gold or on banks, but rather in the panic rush to purchase gold and other currencies on the international financial market far away from U.S. territory. Despite the all-out efforts of the United States to maintain the strength of the U.S. dollar, its official external price differed increasingly from its internal price and its maintenance at least became impossible. In August 1971, the U.S. dollar ceased being exchangeable for gold. In 1973, almost all the Western industrial countries abandoned fixed exchange rates and adopted floating rates. This marked the final disintegration of the international monetary system centering on the U.S. dollar. It also showed the limitations of the united measures of state monopoly capitalism.

Since the floating exchange rates went into effect in Western countries, exchange rates of their currencies and gold price are decided by the relationship between supply and demand, and are also affected and regulated by political, economic and other factors, thus changing frequently and in a disorderly way. For example, the price of gold jumped from $37 per ounce in 1971 to over $800 in early 1980. After that, owing to the high U.S. interest rates and other factors, the gold price dropped sharply again. Disorderly fluctuations of currency exchange rates and gold prices demonstrated the partial failure of the efforts of international state monopoly capitalism to establish a stable monetary system worldwide, thus causing disturbance and disorder to the circulation of international short-term funds and to financial business. That is the substance and typical manifestation of international financial crises since the disintegration of the international monetary system centering on the U.S. dollar.

Economic crises and inflation mutually restrict each other. But inflation and international financial crises interact--they intensify each other. The fact that these three factors mingle with each other and occur simultaneously reflects the severity of economic crises under the conditions of state monopoly capitalism.

In recent years, in the major capitalist countries industrial production growth has slowed or even stagnated, unemployment has drastically increased, and together with striking price rises, these have generally been called "stagflation" in the West. This is the most pronounced characteristic in the cyclical process of capitalist reproduction. In general, countries bogged down in "stagflation" can never for a minute lose their government's support by intervention and the financial credit lever which prevent economic crises from worsening; neither can drastic measures of expansion be taken to stimulate rapid economic growth, for they will cause prices to rise uncontrollably. Thus these countries are often locked in a dilemma.

These comprehensive economic phenomena in the capitalist world appeared in the late 1960's and became prominent in the early 1970's. Over the entire 1970's, they further developed. Not only have they become prevalent in the capitalist world, but they are also regular phenomena in every individual stage of the capitalist cycle. They demonstrate an inevitable tendency in the development of state monopoly capitalism.

A FEW SUGGESTIONS FOR IMPROVING THE AGRICULTURAL PRODUCTION RESPONSIBILITY SYSTEM

Beijing RED FLAG in Chinese No 1, 1 Jan 82 inside back cover

[Article by Yu Yaozhong [0151 6540 0022] of Huai'an, Jiangsu Province]

[Text] How should the agricultural production responsibility system be gradually improved? I have a few suggestions, as follows:

1. The forms of the responsibility system must be relatively stable.

Premature "finalization" is of course undesirable, but relative stability is essential. The responsibility system established through fully democratic discussions in accordance with the wishes of the masses which suits the actual condition of the localities and the production brigades and production teams, no matter what form it takes, should be relatively stabilized. There is now an argument that "full assignment of responsibility is full emancipation of the mind, linking remuneration with output is semi-emancipation of the mind and fixed-quota management is not emancipation of the mind" spreading far and wide in some places. This has disturbed the production brigades which are practicing the production responsibility system of linking remuneration with output and the system of short-term work contracts so that they do not know what course to take. Owing to diverse and confused opinions and hesitations about what to do and what not to do, some localities have to switch from one form of the responsibility system to another: fixing quotas for each group in winter, fixing quotas for each household in summer and giving full assignment of responsibility another try after autumn. The constantly changed forms of the responsibility system and changeable minds of the commune members have become a "bodhisattva in a water vat--an indeterminate god." Therefore, to stabilize the forms of the responsibility system and set people's minds at rest is not only the wish of the masses but also the foundation for improving the responsibility system.

2. The production teams must not be "empty-handed teams."

By the term "empty-handed teams," I mean that the means of production of the collective economy have all been shared out and the production items under collective operation have all been handed out. The emergence of the "empty-handed teams" is the result of failing to have an all-round understanding of the implementation of the production responsibility system. It must be correctly realized that the implementation of the production responsibility system is aimed at mobilizing the enthusiasm of both the collective and the individual, expanding production, strengthening the collective economy and improving the livelihood of commune members. For this reason, the mobilization of the enthusiasm of the collective and the expansion and the strengthening of the collective economy must not be ignored.

3. The tendency toward extravagant eating and drinking must be checked.

It goes without saying that it is a good thing to give mutual aid in rush seasons. But in the summer harvest season this year, some localities treated those whom they invited to help as guests. They busied themselves in buying fish, pork and greens and in serving rich dinners to the guests. Furthermore the peasant households vied with one another in serving dinners to their guests, and they had to spend at least 10 to 20 yuan, or even 20 to 30 yuan, in this way. Some people hold that so long as the grain and property of the collective are not eaten or spent, there should be no interference in the practice of mutual aid and the give-and-take among commune members, which is called "dragonflies eating their own tails." This opinion is not correct. We must encourage mutual exchange of labor, display the spirit of cooperation, be industrious and thrifty in managing a household, and run all undertakings in an industrious and economical way.

4. Output must be honestly reported.

There has been an argument that "one must not be vague on the part within the fixed quotas under a contract, but it is justifiable for one not to be so strict on the portion in excess of output quotas under a contract." For this reason, some localities took the fixed targets in a contract as the real output of this year's summer grain output, excluding the portion in excess of output quotas under a contract. This is mainly because they are afraid that the state will raise the purchase base because "when the river rises the boat goes up." It is imperative to be realistic and practical in this respect. The results of production should neither be exaggerated nor denied. Particularly in the first year when the production responsibility system was introduced, whether the work in reporting the output is done well has a bearing on the work in the coming years. If things are not done well in the first year, then they will be repeated in the second year because there is a precedent. So it is important for the departments concerned to seriously implement the principle that the state purchase base must not be changed for 5 years once it is fixed.

5. Cadres must concern themselves with the affairs of the collective.

Now there is a false impression among some cadres. They hold that "with the responsibility system, the cadres have nothing important left to do. With the heavy load being shouldered by everyone, the cadres feel they can have a breathing spell." The masses of commune members feel very anxious about this state of affairs and say: "Brigade cadres are hard to find, team cadres are devious; when problems are encountered no one knows what to do." This is because, since the implementation of the production responsibility system, new conditions and new problems have emerged which call for timely study. The masses of commune members urgently ask the cadres to strengthen leadership, do more work and find solutions to problems. For this purpose, the cadres at various levels, primarily brigade and production team cadres, must regard the whole farmland of the brigades and teams as their own responsibility plots and rack their brains and take an interest in the affairs of the masses of commune members instead of setting their eyes only on their own responsibility plots.

6. Financial control must be tightened.

The financial affairs of some production teams are not in order, a condition about which the masses of commune members have made many complaints. They say that they would rather suffer losses in the open than suffer losses in the dark. By the term losses in the dark, we mean such problems as confused financial affairs, unplanned and wanton increases in expenditures and subsidies, waste in doing things, corruption and embezzlement of public funds, and the practice of taking more than one's share. In a certain sense, in the matter of improving the production responsibility system, the masses of commune members pay most attention to the democratic financial work. Therefore, it is necessary to rectify the financial work and tighten financial control.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

STUDY HISTORY, DISPLAY PATRIOTIC SPIRIT

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 2-5

[Article by Wang Zhen [3769 7201]]

[Text] Editor's note: Recently Comrade Wang Zhen invited a few comrades from the Propaganda Department of the CCP Central Committee, the Research Office of the CCP Secretariat and the CYL Central Committee to a discussion meeting at which he expressed his views on studying the modern history of China. In his talk, Comrade Wang Zhen recommended a new book by Hu Chen entitled "From the Opium War to the May 4th Movement," stressing the importance of studying modern history and calling on all people to promote cadres' and youths' study of history and to boost the upsurge of the fine general mood of the society related to book learning, so as to boost the people's morale, inspire their fighting will and display the patriotic spirit of working hard for the growth of the Chinese nation. This talk is of great significance in promoting among the broad ranks of cadres and youths the study of history, the building of socialist spiritual civilization and the strengthening of education on patriotism. We hereby publish the full text of it.

Today, I am going to have a talk with you.

During the past 2 years, I spent the time when I was recuperating after operations by reading a few books on the history of Russia's aggression against China, the biographies of a few historical figures, such as "Biography of Sun Yat-sen," "Biography of Lin Zexu," "The Chronicle of the Life of Huang Xing" and a biography on Yan Fu's life. Later I relatively carefully read a new book by Comrade Hu Chen entitled "From the Opium War to the May 4th Movement." The book contains 27 chapters and a total of 700,000 characters. I originally planned to read it in 2 months, but I finished it in 1 1/2 months. Comrade Hu Chen is a scholar in our party and is an old friend of mine. His book narrates the 80 years of the Chinese nation's history of repeated serious disasters and gives a clear description of every historical event. For us who have taken part in the struggle when our nation's existence was in peril, we feel ever greater pride when we read the history of that period. Historical books of this kind are very useful, especially in educating cadres and youths about history. Such books will make them understand the history of the imperialists' oppression and the Chinese people's resistance, strengthen their sense of patriotism and make them know better why they should support socialism and the party's leadership.

I have had no schooling and little learning. However, I am quite familiar with the history from the Opium War to the May 4th Movement. The history of this period is not only recorded in history books but also spread far and wide among the people. None of my forefathers were scholars either. My father was a farm laborer. In my childhood, I heard him tell us stories about the Taiping army, called "long hair" at that time, who fought against the Qing army and stories about Tao Shu, an official of the Qing Dynasty (editor's note: Tao Shu, a native of Anhua County, Hunan Province, was appointed governor of Jiangsu, governor of Anhui and viceroy of Liangjiang.) I also heard legends about the Hongjiang Hui (Hongjiang River Society), the Ge Lao Hui (Society of Brothers) and other revolutionaries from my father. However, it was not until I joined the revolution that I gained a relatively correct understanding of the history of this period. Chairman Mao once told me that Lin Biao had not even the least knowledge of Chinese history. He told me to draw a lesson from Lin Biao and learn some history. Therefore, I am very pleased when I read a good history book.

The China today has been developed from the China of the past. In the preface of his book, Comrade Hu Chen gives a simple outline of the Chinese feudal society before the Opium war. The whole book narrates and analyzes how China was reduced, step by step, to a semicolonial and semifeudal country due to the aggression of the capitalist powers and narrates and analyzes the several upsurges and setbacks in the revolution in China in the time period of a century. A history book of this kind can be used as a textbook to teach people to understand the law governing the development of the Chinese history and understand the origin of China's present situation. Reading a history book of this kind can relatively systematically teach people to be aware of the difficulties in founding the PRC and, at the same time, help us to understand many problems raised in the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC." For example, the question on the evaluation of Chairman Mao. If we have studied modern history and have a complete view of the great changes during the time period of little more than a century, we will find that compared with other historical figures, Chairman Mao was a statesman of rare gifts and bold strategy, of extensive knowledge, of deep insight and of strong will and a statesman who achieved great merits. We all know that Comrade Chen Yi was a man of great talents and that it was difficult for people to win his admiration; nevertheless, he said that he did admire Chairman Mao. Of course, there have been quite a few outstanding figures in China's modern history, such as Zhou Enlai, Liu Shaoqi and Zhu De, who were all outstanding leaders of our party and our people. Besides, there have been many well-known thinkers, politicians and generals and excellent scholars and artists. We must say that without these outstanding historical figures and particularly without Chairman Mao, the Chinese nation could not be what it is today. We should not negate Chairman Mao's immortal contributions in Chinese history because he committed mistakes during the "Great Cultural Revolution'" When we have read some history books and have got some understanding of China's history over the last century, we will naturally and logically affirm Chairman Mao's historical position.

This book by Comrade Hu Chen contains a great amount of materials and makes a historical materialist analysis of people and events. This shows Comrade Hu Chen's meticulous scholarship. We should hold such scholars in respect. Regarding China's modern history, there are quite a few books available, even when not including this one written by Comrade Hu Chen. Moreover, there is not merely a single area of historical research in all of the academic and theoretical circles. For many years, many comrades have done a great deal of hard work in various academic fields and have achieved great results. What they have done is very necessary and very valuable for our socialist modernization and for our struggle for world peace. Any scientific, literary or artistic works and any effective creative labor that contribute to the four modernizations and contribute to arousing the people's fighting will and their patriotism for our great motherland must be affirmed. Whether we have adopted a correct policy in treating our intellectuals and whether we have adopted a correct attitude toward the excellent results of mental labor and spiritual production is a major issue that concerns the success and failure of the socialist cause. When I was young, I had many contacts with intellectuals. After the May 4th movement, I was a janitor for some railway senior clerks. Because of the ideological influence of the May 4th movement and because of the influence of the workers movement, these clerks, school-aged children, had changed their attitude toward workers. They not only did not look down upon us workers or treat us as servants, but also made friends with us. The times were progressing and so were the intellectuals. I should say that since my first contact with such progressive intellectuals, they have made a good impression on me. In the long-term revolutionary struggle since then, I have never committed mistakes related to intellectual problems. Chairman Mao once said to me, "Wang Shiwei would not have been killed if he had been in a place in your charge." Naturally, there have been reactionary and bad intellectuals, but their number has been small.

My purpose in inviting you to come here today is to recommend Comrade Hu Chen's history book and to propose to you that our cadres and youths should read some books about China's modern history. We all keenly feel that our social morality has been much corrupted since the "Great Cultural Revolution." Our party has done a great deal of work in order to change this situation. Comrade Deng Xiaoping's speech on the adherence to the four basic principles and Comrade Ye Jianying's speech at the 30th anniversary of the founding of the PRC contributed to bringing about such a change. The "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC" approved by the party's sixth plenary session, Comrade Hu Yaobang's speeches at the 60th anniversary of the founding of the party, at Lu Xun's 100th birthday and at the 70th anniversary of the 1911 revolution, and Comrade Zhao Ziyang's report concerning the 10 principles for economic construction also contributed to bringing about such a change. In order to bring about such a change, the All-China Federation of Trade Unions, the CYL Central Committee, the All-China Women's Federation and other organizations have put forth the "five stresses" and "four points of beauty" and the PLA has raised the call for "four haves, three stresses and two nonapprehensions" [having lofty ideas, good morality, knowledge and good health; stressing the army's standard on appearance and bearing, good manners and good discipline and not being apprehensive about either hardship or bloodshed and sacrifice]. By all the above and in addition to the PLA's Fakashan and Koulinshan battles for national defense and against the Vietnamese aggressors, by the heroic struggle against floods and drought in many provinces and areas last year, by the arduous efforts made by the public security and judicial departments in order to safeguard public security, by achieving great results on the agricultural front and in all the sectors which make up the economic front, by making tremendous progress in scientific, educational, cultural, hygiene and sport fields and by opening up a new situation on diplomatic front, we are displaying our nation's heroism and revolutionary spirit. A nation must have its own healthy national trend which constitutes a great strength in uniting the masses and encouraging everybody to actively make progress. Comrade Hu Yaobang said that he particularly upheld livening things up and inspiring and developing our national spirit and morality. A good national spirit and a good national morality marks the prosperity of a nation. Encouraging book learning and establishing a good style of study will open up a path for establishing a good national spirit and a good national morality. We should guide our broad ranks of cadres and youths to study hard, and that includes studying history. One usually has some leisure time after 8 hours of work, labor or study. We should teach people to spend more of their leisure time in reading instead of taking part in recreational activities, and thus create a new social mood of book learning and a new social trend of study. Ours is a socialist country. In this country, unhealthy trends in whatever form are not allowed to run rampant, to pollute the society, to corrupt the people's morality or to hinder our four modernizations. We should mobilize the whole party and the whole people to pay attention to encouraging the practice of studying, especially to paying attention to the studying by youths. The CYL, the trade unions, the women's federations and all other social organizations should strive, under the leadership of the party, to promote a new upsurge in the practice of studying. As Lenin pointed out, "First, study; second, study and third, study." This will remain a slogan that we will lay great stress on.

We should learn modern science and technology and, at the same time, we should learn the social sciences including history. We should not forget the arduous course our nation has undergone and we should not forget our past. In the past, our country was a semicolony divided up at will by other countries. But today our status has been greatly changed. For example, in Comrade Hu Chen's book, he mentioned the fact that a few imperialist powers scrambled for the right to build railways in China. Today, we not only have the full sovereignty in building railways, but also have a strong technical capacity in this respect including hundreds of thousands of railway corpsmen. I was once commander in chief of the PLA Railway Corps and, at that time, I was opposed to situating our headquarters in Beijing. Comrade Peng Dehuai agreed with my view and said to me that we should build our railway up the Himalayas and be buried on the spot that we died. Today, our country has not only completely taken its destiny into its hands and has not only gained independence in deciding its own policies, but is also having political, economic and cultural contacts with various countries and nations in the world on the basis of the principle of equality and mutual benefit. Moreover, we are playing our role in the just cause of world peace and human progress.

The enemies at home and abroad caused grave disasters to the Chinese people. Could there have been such a new situation as today if the Chinese people of all nationalities had failed to carry out their prolonged brave struggle, if they had failed to firmly unite or if they had failed to display their great national heroism and patriotism of striving for the prosperity which has been forged through struggle? Today we have raised our magnificent target of realizing socialist modernization and have charted a path for socialist modernization that suits the national conditions of our country. The strong response this target has aroused from our people has proved that there has been a profound objective basis that underlies this national spirit. We can completely affirm that our socialist system will certainly be able to develop the Chinese national spirit to an ever-higher standard.

Of course, in our country, besides the sabotage activities of counterrevolutionaries and various kinds of criminals, there are still quite a few corrupt, backward and unreasonable practices. These include graft, embezzlement, smuggling, speculation, bribery, confiscating public property for personal use and other activities that violate laws or discipline. They also include unhealthy practices, such as superstition, gambling, extravagant weddings and funerals, worshiping and having blind faith in things foreign, under-the-counter relationships and using one's official position to achieve private ends. There are also the bureaucratic phenomena of organizations being overstaffed, shirking responsibility and having low work efficiency. Some people employed in natural scientific undertakings have nothing to do, but on the other hand, people are loudly complaining that they lack scientific personnel. All these phenomena must be changed or brought to an end. Nevertheless, these phenomena are not something to be feared or to be disappointed about, for our party is resolutely and unswervingly fighting against such phenomena and is making progress in the course of fighting against these phenomena.

The progress of modern China's history is the best evidence that we will certainly be victorious in our struggle. That is why we should encourage the study of history; especially China's modern history. In analyzing historical personalities, we should avoid simplicity and one-sidedness. Generally speaking, officials in a feudal society oppressed the people. But regarding specific persons we should not fail to see that they differed: some were hard working and others lazy, some were good and others bad and some were corrupt and others honest. Some officials were incompetent and, in addition to their high salaries, seized land, exploited the people, extracted extra levies and led extravagant and lewd lives. But there were others who had some insight and had achieved some merits. For example, in the Han Dynasty, we had heroes such as Zhangqian and Banchao, and in modern times, we had such national heroes as Lin Zexu, Feng Zicai and Deng Shichang. Even a personality such as Zuo Zongtang should be concretely analyzed. On the one hand, he committed the crimes of suppressing the people, but on the other hand, in his later years, he contributed to our nation and country by defending China's sovereignty and territory, safeguarding China's unity and resisting the expansion of Britain and Russia. We should make concrete analyses of historical personalities and should even affirm the outstanding roles of some personalities of the ruling classes. This is by no means contradictory to the thesis that history is created by the people.

Chairman Mao in a speech at Yanan said that we should not only know the China of today but also the China of yesterday. He called on us to study the present situation as well as history and Marxist theory. This call is even more important for today's youths. I believe that by conscientiously reading, by making reading a constant practice so as to be armed with the weapons of social sciences and the science of history, our youths will not only increase their knowledge, talents and competency, but can also firm up their confidence in the revolution and set high aims and lofty aspirations. Of course, whatever subjects our youths choose to major in, we should encourage and support them. However, through the study of history, our youths will see that it was owing to the undaunted and heroic struggle of our great people and their bravery in the face of bloodshed and death that our country has survived so many national disasters and so many aggressors. In this course, we had undergone innumerable failures and setbacks until we finally found Marxism, set up the CCP, led the people to overthrow the three great mountains and founded the PRC. This took us more than a century to achieve. We should treasure what we have achieved and strive for prosperity on the basis of what we have achieved.

Only by intensifying their study will our youths be able to be devoted to their work and to have a sense of responsibility. Not only the youths who major in social sciences should study history, but those who major in natural sciences should also study history. Youths who pursue whatever profession should learn something of history. Stalin said that a Leninist should not be a specialist only in the subject of a science he likes; he should, at the same time, be a politician and a social activist and he should concern himself with the destiny of his country, understand and know how to make good use of the laws governing the development of society and do his best to take an active part in the political leadership of his country. For this, one should study Marxist theory and study history. We should conduct education in history and in patriotism among the youths in a better, more flexible and more lively manner. Naturally, in order to build socialism and make China prosper, we must study and strive to master and introduce foreign advanced science, technology and management and, moreover, we must study them for our socialist motherland and must resolutely fight against the disgraceful practice of worshiping and having blind faith in things foreign.

It is necessary for an old, weak man like me to resign all his posts and retire from his office. Though retired, a man like me can find some work he is capable of doing. As an old CCP member, one should do what one should do. In this sense, no official titles or authorization are needed. Maybe what is left of my life are only a few months or days, but as long as I can, I will go around, look around and do the present urgent task of training successors. For example, I will take up the task of working with youths, such as guiding them in the study of history. This is a very important task. My aim in having you talk with me today is that you will boost the study drive to a new upsurge. I hope that I can do, together with other retired old comrades, what we can do in our remaining years. Old comrades can draw on rich experience. Some of them are experts in some special fields, for example, some of them have some special technical or academic knowledge, some have good penmanship and some are skilled in painting. They are all precious wealth of our party. Though owing to their health they cannot be engaged in the busy posts in the first line, they can use what they are good at in training the coming generation and play their role to the full in building the socialist spiritual civilization throughout the country. The world is vast. As far back as in the Eastern Han Dynasty, Ma Yuan said, "A man who dies in the border area and whose body is wrapped in horse hide should be carried back to be buried in his homeland. How can he die in the arms of a woman?" Today, we need not wrap our bodies in horse hide nor be buried in our homeland. As long as our health permits, we must regard the vast world as our home and never should we madly cling to Beijing and other big cities.

I believe that so long as the Propaganda Department of the CCP Central Committee and the Central Committee of the CYL take the lead, so long as the old generation, and that includes me, goes all out to make more efforts, so long as scholars like Comrade Hu Chen carry out their studies and research, and so long as the many specialists in the theoretical circle and our colleges in the arts play their roles to the full and jointly promote as one the book learning of our youths, we are sure that we can set the fine style of study and the healthy trend in our society.

ACQUIRE A CLEARER UNDERSTANDING OF GUIDING THOUGHT CONCERNING CORRECT RURAL WORK

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 6-10

[Article by Chen Pixian [7115 0012 7309]]

[Text] In the past few years, like other rural areas of the country, the countryside of Hubei has all along witnessed a very favorable situation. Fast progress has been achieved. This has been a source of great inspiration. But amid progress, certain new conditions and new problems have appeared. This requires us to further understand guiding thought concerning rural work. Otherwise, the development of the very favorable situation in the countryside is likely to suffer.

What is the guiding thought that we must further understand in our current rural work? Generally speaking, we must further properly handle the relations among the state, the collective and the individual; insist on taking the planned economy as the primary factor and regulation by market mechanism as the secondary one; direct peasants' enthusiasm toward the study of agricultural science and technology; the proper introduction of scientific farming and the improvement of management and operations; blaze a new trail of overall development and attention to economic results; do a better job in increasing agricultural yields and income; and make the countryside get rich in a gradual and healthy manner. All this we must do in the process of continuously carrying out a series of economic policies in the countryside introduced since the 3d Plennary Session of the 11th CCP Central Committee and in the process of steadily perfecting the production responsibility system. Under the guidance of national plans, we must lead the masses of peasants in an effort to develop production and tap the potential in their own enterprises. We cannot always look to the higher levels and count on the state to give the peasants more benefits at present by further raising purchase prices. In this respect, we must have unified awareness. We must make the countryside rich but this should be achieved in a healthy manner. Can we get rich by allowing the peasants to act as they please and to take expedient measures that are of benefit only to themselves? No. This would only interfere with national plans and impair the overall interests of the country, thus injuring the peasants' fundamental interests. Can we just rely on the state to make the peasants rich? No. This is because the existing resources of the state are limited. Prices for agricultural products have in the past few years been raised greatly and much has been done with regard to agricultural subsidies. Therefore, we must insist on taking planned economy as the primary factor and regulation by market forces as the secondary one, and integrate the interests of the state, the collective and the individual. Only in this way can we achieve the aim of getting rich in a healthy manner.

Agricultural production for Hubei Province last year, generally speaking, was satisfactory. It was a year that can be considered far better than the average. Output of grain, cotton, edible oil and agricultural and sideline products in the second and third categories, except for live pigs, rose compared with the preceding year. The province's diversified economy registered relatively fast growth. There was also relatively great progress in developing communes' family sidelines. Peasants' income chalked up a general increase. However, some time ago, the business of purchasing and turning over agricultural and sideline products to the state was not done well enough in some respects. 1) Everyone reported an increase in grain output, and there was really a big increase in some cases. But when it came to the purchase and marketing of grain, there was always a demand for purchasing less and selling more on the market. 2) There were increases in second and third category agricultural and sideline products, in regard to both output and purchases. But the job of turning over products to the state was not done well enough. There was a demand for turning over more of what is unsalable to the state or keeping less of it, and a demand for turning over less of what is salable to the state or keeping more of it. 3) Where there had been a drop in the number of live pigs, state purchases, or sales to the state, showed a still poorer record. There were many causes for this situation, both objective and subjective. There was the problem of inadequate attention having been paid to work and a display of laxity and weakness on the part of the leadership. There was also the problem of certain people having a weak sense of planning and a weak concept of viewing the situation as a whole and not acting according to state plans.

This situation appears to be a concrete problem concerning the matter of purchasing and turning over agricultural and sideline products to the state. Actually, it is a problem of guiding thought concerning our current rural work. The core of it is how to properly treat the relations among the state, the collective and the individual. In a speech at a conference marking the centenary of the birth of Lu Xun, Comrade Hu Yaobang said: "In certain departments and, primarily, in economic departments, some comrades lack a concept of viewing the situation as a whole. Anything that does not serve their partial interests or appeal to their own taste is shunned or not acted upon. This is a wrong departmental act injurious to the overall interests of the state." Comrade Hu Yaobang also pointed out: "Among the cadres of certain industrial and mining enterprises and certain rural communes and brigades, the practice of acting against the concept of viewing the situation as a whole and taking the interests of the state, the collective and the individual into consideration--a concept hitherto advocated by the party and the state--and the practice of flaunting the banner of acting in the interests of the masses actually represents a backward idea among some workers and peasants. At the first opportunity, they make claims upon the state and demand a high price. This is a wrong act injurious to state interests." Comrade Hu Yaobang's speech tells us that we must thoroughly implement the guideline of paying simultaneous attention to the interest of the state, the collective and the individual. We must conduct relevant education among the cadres and the masses. We cannot one-sidedly stress individual interests, to the neglect of state and collective interests. Between September and October last year, we began to take note of the problem of purchasing and turning over agricultural and sideline products to the state, and directed quite an effort to this matter. In November, we again emphasized discussing the problem of simultaneous attention to the interests of all three sides at meetings of secretaries of prefectual and municipal party committees, and succeeded in raising awareness. After such meetings, the whole province upheld this spirit. The situation quickly turned for the better, as far as the matter of purchasing and turning over products to the state was concerned. At the end of last year, purchase quotas for grain and oil seeds were overfulfilled. The pace of purchasing cotton lived up to expectations. The number of live pigs purchased and turned over to the state showed a big increase compared to before November. Facts show that so long as we have a clear idea of guiding thought, the masses of cadres and people in the countryside will support us. Of course, we have now only raised the level of thinking and awareness initially. In future, we must conduct education in a penetrating and sustained manner, enabling such guiding thought to permeate all the province's rural work.

In the past several years, our country chiefly relied upon three ways to revive and develop our agriculture: 1) correcting "leftist" mistakes and relaxing restrictions; 2) raising the prices of agricultural and subsidiary products; 3) importing a given quantity of grain every year. These three policies were aimed at arousing the peasants' enthusiasm, developing a diversified economy, raising the commodity rate and enlivening the rural economy. As far as the future is concerned, the first must be adhered to. In no way can we relax attention to grain production and the energetic development of a diversified economy. Various versions of the production responsibility system and such practices as keeping private plots, promoting family sidelines, holding country fairs, and so forth must not be changed. The third policy of importing grain must also be continuously carried out within given limits, so as to facilitate the readjustment of the structure of agricultural production. As to the second policy, the prices for agricultural and sideline products must be basically stabilized and cannot be further raised. In the past few years, the state has spent much on subsidies for raising the prices of agricultural and sideline products, for selling prices, and on subsidies for the prices of imported grain, cotton, sugar, and so forth. This is entirely necessary. But at present, the state cannot afford to further raise purchase prices and subsidies. If we just raise the prices of agricultural and sideline products without a great development in industrial production, and if we thus fail to satisfy the peasants' demand for industrial goods and cannot withdraw currency from circulation in a normal manner, this will not help stabilize the prices of industrial products. What benefits the peasants derive from the state will also end up being lost. Therefore, given the existing resources of our state and the level of industrial production, a further big increase in the prices for agricultural and sideline products is unrealistic. In improving the living standard of the peasants in future, we must not chiefly rely on raising the prices for agricultural and sideline products. Instead, we must rely on policy and science in the overall development of agriculture, forestry, animal husbandry, sidelines and fishing. We must thus energetically raise the commodity rate and improve economic results. In this respect, guiding thought is very important. If the matter of guiding thought is not properly taken care of, problems will arise in purchasing and turning over agricultural and sideline products to the state. If what should be purchased is not procured and what should be turned over to the state is not handed over, this will directly affect industrial production and affect the life of urban residents, the worker-peasant alliance and even the economic construction of the state as a whole. Therefore, we must strengthen socialist and patriotic education among rural cadres and commune members, so that they can understand the great importance of paying simultaneous attention to tripartite [state-collective-individual] interests, consciously make greater contributions to the state, strive to fulfill state plans and support cities, industry, export promotion and socialist construction.

It should also be noted that if our guiding thought concerning rural work is not correct, the development of agricultural production itself will suffer. For example, regarding the cultivated area, we must stress the need of guidance from state plans. On this basis, we must bear local features in mind and make rational arrangements for the distribution of crops. As far as the area sown to grain is concerned, the province had 83.17 million mu in 1978 and 79.01 million mu last year, a drop of 4.16 million mu. Such a readjustment, generally speaking, is rational. But it must also be noted that the sown area must not be further reduced. Given not a big increase in per mu output, an excessive reduction in the total area sown will affect the total output of grain. Also, the area sown to cotton must also be kept at a steady level. Another problem is a serious situation of good land being occupied to build rural housing. According to incomplete statistics, the communes and brigades throughout the province have occupied a total of 1.65 million mu of land for building housing since 1970. For a commune in a certain county, the area occupied for building housing averaged nearly 2 mu per household. This was 8 times the 0.25 mu for a general residential unit. We must pay great attention to this problem. We must set great store by every inch of land. We must strengthen education and inspection and strictly act according to regulations laid down by the State Council and the provincial people's government. We must change the situation of freely occupying and using cultivated land. The situation of freely appropriating vegetable fields in urban construction is also very common and must be brought under strict control. Also, we must perfect the production responsibility system. One of the important principles to be followed in this regard is that the responsibility system must embody and contribute toward the proper handling of the relations among the state, the collective and the individual. We must pay particular attention to guarding against and resolutely overcoming the erroneous practice of distorting the production responsibility system and destroying and occupying collective property.

The problems mentioned above have a bearing on the correct handling of the relations among the state, the collective and the individual. Since the third plenary session, we have corrected "leftist" mistakes in the countryside, turned chaos into order, introduced a policy of relaxing restrictions and enlivened the economy. This guideline is entirely correct. In the future, we must continue to firmly and unswervingly carry out our party's various economic policies toward the countryside and further perfect various versions of the production responsibility system. In certain fields, such as the area of circulation, we must further study policies and measures for better handling rural commerce. The problem at present is by no means one of changing policy or retracing the old road toward rigid control. Instead, the problem is to realistically carry out the guideline of taking planned economy as the primary factor and regulation by market mechanism as the secondary one and to flexibly use the market as a regulation factor within the limits of a planned economy. This is to say that what should be controlled should be realistically controlled. What should be enlivened should be persistently enlivened. We should never freely make changes. At present, we must resolutely overcome anarchism, departmentalism and the erroneous viewpoint of one-sidedly stressing mass interests. Within the limits of planned economy, we must enliven the economy in a more healthy manner. We must correctly handle the relations among the state, the collective and the individual, divert peasants' attention to the development of production and the tapping of the potential in given enterprises. We must direct energetic efforts toward scientific farming and the improvement of management and operations. The earlier this guiding thought is made clear and the more conscious we are, the greater initiative we will have in our work. Otherwise, our leadership over rural work will be marked by laxity and weakness, hampering the healthy growth of the rural economy.

As far as the existing actual conditions of the countryside of Hubei Province are concerned in light of this guiding thought, several important problems must be put forth for discussion and study.

1. Planned cultivation. In guiding agricultural production, we must respect the autonomy of the production team, so that it can, with local features in mind, properly arrange for the distribution of crops and act according to objective laws. This is a prerequisite for the proper handling of agricultural production. But we must also be guided by state plans. This principle must not be given up. State plans are based on the actual conditions of the country as a whole. We must integrate different conditions, as far as both the whole and parts are concerned. Only in this way can we really get down to earth. In arranging for grain production, we must take into consideration the needs of the whole province and the whole country and must guarantee a sown area of 80 million mu. As to cotton, we must likewise consider the needs of the whole province and the whole country and guarantee a sown area of 8.5 million mu. We must make plans after discussions among cadres and the masses and see to their firm implementation at every level. We must also strengthen planned guidance concerning other economic crops and multiple undertakings, especially certain principal items of production. This is to avoid doing things blindly, submitting conflicting reports about production

figures, effecting sudden big changes and thus causing great economic losses to the state and peasants. Therefore, we must strive to do a proper job of forecasting economic development. We must make forecasts item by item, concerning the social demand for certain main products and the relevant production capacity. This will provide a scientific basis for drawing up plans and guiding production.

2. Purchase and sale of grain. In the future, we must continue to intensify our efforts toward grain work and cannot relax our efforts. Concretely speaking, we must keep the cultivated area at a steady level, as far as production is concerned. We must pay primary attention to per mu production and an increase in total output. In regard to distribution, we must adhere to the policy of planned purchase and marketing by the state. We can in no way show the least hesitation for that matter. Nor can we rely upon increasing purchases obtained as a result of negotiations and reducing planned purchases to solve the food problem. It should be clear that planned purchase and marketing by the state is a fundamental policy in our distribution of grain. Given a continuous development of production, we must properly increase purchases and rationally control sales, fulfilling quotas for products turned over to the state and adding gradually to stocks in reserve year after year. Thus, the aim of a balanced budget and a surplus can be achieved.

3. The purchase and transfer of second and third category agricultural and sideline products to the state. According to the stipulations of the State Council, the general principle should be that we insist on taking planned economy as the main factor and regulation by market mechanism as the secondary one; pay simultaneous attention to the interests of the state, the collective and the individual and coordinate the autonomy of the production team, the peasants' initiative and the requirements for the state's planned economy; and correctly handle the relations between the state and the peasants, between the central and local areas and between the producing area and the area where sales are effected. This is to facilitate the readjustment of the national economy, further develop production, and enliven the economy. The leadership at all levels must exercise supervision and make inspections. Those products that should be turned over to the state must be turned over, with both quantity and quality requirements guaranteed and with the fulfillment of the quota resolutely guaranteed.

4. The problem of live pigs. Pork in Hubei Province is in relatively short supply. On the one hand, the increased income of urban and rural residents has resulted in a great demand for pork. On the other, there was a drop in the province's figures last year for live pigs raised, purchased and turned over to the state. There were many causes for the drop in the number of live pigs raised, purchased and turned over to the state. Two years ago, Hubei Province experienced an unusually serious flood disaster which caused a sharp drop in grain production. This was an important factor. But we cannot simply blame everything on this one factor. With the introduction of the responsibility system in the countryside, new measures for encouraging pig breeding and the fulfillment of purchase quotas were not carried out in time. This was also one important factor. Therefore, to basically solve the problem of live pigs, we must stress doing our work well in the following two respects.

a. We strive to guarantee the normal supply of pork to meet urban needs. This is an important problem concerning the life of urban residents. We must constantly conduct education among cadres and peasants, so that they can strengthen the concept of the state and the concept of viewing the situation as a whole and ensure the fulfillment of quotas for products turned over to the state. The city, for its part, must also strengthen control over the supply of pork and achieve the aim of making rational arrangements for supply.

b. From now on, we must direct vigorous efforts toward pig breeding and bring about a big increase in the number of live pigs raised this year.

Party committees and governments at all levels must strengthen leadership. We must devote considerable efforts and several meetings a year to the study of a solution to the problem of breeding, purchasing and turning over live pigs to the state. We must realistically draw up plans for the breeding of live pigs and adapt ourselves to such practices as basing remuneration on output, with each laborer and each household held responsible--practices followed since the introduction of the production responsibility system. We must see to it that purchase quotas are duly fulfilled by each household. We must conduct education among rural cadres and commune members, so that they can understand that the fulfillment of purchase quotas is a proper contribution to the state.

We must continuously carry out the guideline of combining collective and private pig breeding with the main emphasis on the latter. We must seriously carry out the party's policy of encouraging private pig breeding among commune members. We must encourage raising as many pigs as we can and refrain from obstructing the pig-breeding effort or limiting the number raised. We must pay particular attention to taking good care of those households that concentrate on pig breeding or specialize in the effort. The "responsibility plot" fixed must be allowed to stay on a stable basis, so that the commune members can stop worrying and display enthusiasm in raising pigs and collecting and applying manure. Meanwhile, we must advocate the collective raising of sows and the breeding of piglets by the production team, so that the source of pigs can remain stable and the species can be improved upon. Every effort must be made so that we can independently breed and raise pigs ourselves. Collective pig breeding must also be guided by a contract or responsibility system, with the team, the household or the individual held responsible.

We must firmly carry out the policy concerning fodder. In raising pigs, we must use various kinds of fodder. But we cannot do without a fixed main kind of fodder. We must understand the principle "the more pigs raised, the more manure and the more grain." On the surface, it seems that raising pigs calls for more grain. Actually, by raising pigs, more manure is made available. This in turn leads to a greater output of grain. In solving the fodder problem, not only must the production team contribute a little collectively but the state must contribute a little. Fodder is sold to pig-breeding households at special prices fixed by the state, so that the peasants can profit by raising and selling pigs. Peasants must take care of the state's needs and interests. The state for its part, must also take care of the peasants' rational interests. The interests of all three sides must be really taken care of. Only in this way can pig breeding be developed.

We must also improve management and operations in purchasing live pigs. The commercial departments must energetically support the development of pig breeding and give the masses every convenience in selling pigs. In the season when fat pigs can be taken out of the pen for sale, we should never repeat the previous practice of stopping collection and limiting the number purchased. Meanwhile, we must strengthen control and take immediate action to stop the sale of pork by unlicensed vendors in the market. Licensed vendors can also only deal in the pork that the peasants keep for themselves.

5. The problem of vegetables. In the past few years, various cities in Hubei Province have attached importance to vegetable production and have achieved some results. A trend toward growth has marked the variety and output of vegetables. The problem now is that things sometimes improve and sometimes deteriorate. Market supplies are unbalanced. Prices of vegetables traded at country fairs are often relatively high. The masses have much to complain about. The supply of vegetables represents a major event in the life of urban residents and concerns millions of households. Therefore, we must pay adequate attention to this work. We must adhere to the guideline of calling for the suburbs of a city to concentrate on vegetables in its agricultural production. The area planted to vegetables must be put on a fixed basis. A protected vegetable area must be defined and kept from being appropriated. Those fields not belonging to the protected area must also be subjected to strict control and properly treated, if they should be appropriated. All vegetable teams must resolutely uphold the principle of "basing output on needs and producing slightly more than is sold." Under the guidance of state plans, they must introduce the economic contract system and strictly fulfill contracts, giving awards for those performing well and imposing economic sanctions on those violating a contract. They must do well in planned production (including planned variety), planned marketing and planned pricing. No matter what the version of the production responsibility system introduced, the vegetable teams must help with planned production and planned marketing. They should also improve the control and handling of vegetables, introduce the commercial operation responsibility system, overcome the idea of eating out of a "big pot," gradually improve operating conditions, cut losses and waste, reduce costs and improve economic results.

6. The base taken for products purchased and turned over to the state. How should we pay simultaneous attention to tripartite interests in purchasing and turning over agricultural and sideline products to the state? It seems that fixing a base and letting it stand for several years at a time is a relatively satisfactory method. There has been a base for planned state grain purchases. This has produced a good effect. Now some areas report that the masses hope that a base should also be fixed for purchases exceeding given quotas--a base that should not be discussed yearly. This approach is worth consideration. Not only grain but also agricultural and sideline products--products where conditions permit--can also be provided

with a fixed base for planned state purchases or allotted purchases. This base must be firmly upheld not only at the production team level but at the household level. Only in this way can we adapt ourselves to new conditions arising after the introduction of the responsibility system with output linked to labor and to each household. There is also the problem of turning over products to the state. Where conditions permit, we should also adopt the method of fixing a base. Concerning what exceeds a given quota for second category agricultural and sideline products turned over to the state--products that sell well--we may adopt the method of fixing proper proportions for distribution. Of course, when it comes to a fixed base in concrete practice, there are many complicated problems calling for serious study and rational solution.

We must acquire a clearer idea of guiding thought concerning current rural work. We must set straight the relations among the state, the collective and the individual. We must first of all properly solve ideological problems within the party and rectify the party's work style. Our party represents the interests of the people. It must not only show concern for the immediate and partial interests of the people but also take care of their long-term and fundamental interests. It must unify interests in these two respects. However, at present, some cadres do not understand that only on the basis of developing production can we gradually improve the living standard of the people. Instead, they fix their eyes on the state thinking that only with money from the state can something be done for the people. Some turn to the state for help under the signboard of showing concern for the interests of the people. Some act against the interests of the state and the collective and one-sidedly stress individual interests. Some even abuse their authority to serve private ends. Other similar cases may be cited. The party organizations in some areas have failed to persistently conduct socialist and patriotic education. They have lacked the courage to criticize erroneous ideas and to fight unhealthy practices. This has reflected laxity and weakness on the part of the leadership. Therefore, the party organizations at all levels of the province must seriously study the spirit of "Comrade Deng Xiaoping's speech on rectifying the party work style," Comrade Chen Yun's "Tell the Truth, Do Not Save Face," and the central forum on problems on the ideological front. They must put rectifying the party's work style and strengthening ideological leadership high on the party committee's agenda. So long as those within the party have a clearer idea of the guiding thought concerning current rural work and rectify the party's work style, we can surely lead the masses of cadres and people of the countryside of the whole province in scoring still greater achievements in socialist construction and making proper contributions toward rejuvenating China.

THE PROGRESSIVE FORCES ARE BOUND TO TRIUMPH OVER THE DECADENT FORCES

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 11-12

[Ideological commentary by Shi Jian [0670 6015]]

[Text] Over 5 years ago, our party carried out the people's will by smashing the counterrevolutionary clique of the "gang of four," which had committed countless crimes and deserved to be brought to judgment. This was a great victory of historic significance for the progressive forces over the decadent forces in China's socialist period. Since the downfall of the "gang of four," especially since the 3d Plenary Session of the 11th CCP Central Committee, our party has led the people in bringing order out of chaos on various fronts. Thus our country has become stable, the people are united, production has developed and an excellent situation, the likes of which have not been seen since the 1960's, has emerged. The broad masses of people and some people of insight abroad unanimously have praised this excellent situation. However, there are still a small number of people in our ranks who are perplexed ideologically and who are beset with worries that the "gang of four" will "rise again" and "stage a comeback." This reflects their lack of confidence in the ability of our party to lead the people in the drive to accomplish the four modernizations as well as their insufficient understanding of the law of historical development.

According to the viewpoint of a historical materialist, human history invariably develops in a way in which the progressive forces are bound to triumph over the decadent forces and the newly emerging classes are bound to replace the declining classes. This is an objective law independent of man's will. Engels said: "In the course of development, all that was previously real becomes unreal, loses its necessity, its right of existence, its rationality. And in the place of moribund reality comes a new, viable reality." ("Selected Works of Marx and Engels," vol 4, p 212) Has not all human history developed in this way? The slave-owning class and the landlord class were a reality in history, but what happened to them? With the development of history, the newly emerging landlord class triumphed over the decadent slave-owning class and the newly emerging bourgeoisie triumphed over the decadent landlord class. The capitalist system is likewise a "reality," but it will eventually become "unreal" and the socialist system will eventually replace the capitalist system. This change has become an important modern historical process. From the end of the 1920's to the 1940's, Chiang Kai-shek ruled over the country. He commanded massive forces and, with a butcher's knife in one hand and a murderous look on his face, itched to wipe out all of the revolutionary and progressive forces overnight. However, after 22 years of bloody battles, our party led the Chinese people in eventually defeating the most reactionary and decadent force in China's modern history. That the revolutionary and progressive forces should succeed in vanquishing the decadent forces is, fundamentally speaking, due to the fact that the former conforms to the historical trend of the times and reflects the interests and demands of the people while the latter goes against the trend of the times and violates the interests and will of the people.

Naturally, the developments of history do not follow a straight line but have their twists and turns. In the course of historical development, as a result of the decadent forces being temporarily stronger than the progressive forces or the leaders of the progressive forces committing serious mistakes of line, it often occurs that the progressive forces suffer setbacks or even defeats. With respect to the emergence of this tragedy in history, we must be good at seeing through appearances to get at the essence and not be misled by false impressions. The defeat of the progressive forces and the decadent forces holding the upper hand can only be temporary phenomena which will never last long. "A bad experience is the best teacher." So long as the progressive forces conscientiously sum up and draw experiences and lessons and rally their forces, it is not only possible but also unavoidable for them to "rise again" and "stage a comeback."

Here we call to mind an interesting argument in ancient China. Over 2 centuries B.C., Xiang Yu who was known as the "conquerer of Western Chu" was defeated by Liu Bang who was born to a petty official family. Xiang Yu did not have the face to meet the elders and brethren east of the Chang Jiang and so committed suicide by cutting his throat by the Wu Jiang. A lot of comrades know of this historical event. Over 1,000 years later, a poet of the Tang Dynasty, Du Mu, and a politician of the Song Dynasty, Wang Anshi, held two diametrically different views on this historical event. Du Mu wrote a poem entitled "An Inscription on the Wu Jiang Pavillion," expressing his sorrow for Xiang Yu who committed suicide at the Wu Jiang pavillion. The poem read: "For a military commander, winning or losing a battle is a common occurrence that is often unexpected; it is in the nature of a man to bear shame and humiliation. There were a lot of talented persons among the elders and brethren east of the Chang Jiang; who knows? One could stage a comeback some day." According to Du Mu, Xiang Yu should not have committed suicide. There were a lot of talented persons east of the Chang Jiang. If he had not committed suicide, he could have returned to the east of the Chang Jiang and recruited a large number of qualified persons. There was still a possibility of "staging a comeback." However, Wang Anshi did not agree with Du Mu's view. He also wrote a poem entitled

"The Wu Jiang Pavillion" in which he said: "After repeated battles both commanders and fighters were sad and exhausted; the defeat in the central plain made it difficult to turn the tide. Although the brethren were still east of the Chang Jiang, were they willing to stage a comeback with the ruler?" Wang Anshi was worthy of the name "China's reformist of the 11th century" as acclaimed by Lenin, for he noticed that Xiang Yu's defeat was a trend of the times that was irreversible. Although there were still a large number of talented persons to the east of the Chang Jiang, they would not be willing to reverse the inexorable trend of historical development. Xiang Yu was the representative of a major anti-Qin force after the failure of the great peasant uprising led by Chen Sheng and Wu Guang at the end of the Qin Dynasty. He had won numerous battles but he failed because he lavishly granted titles to the nobles and attempted to again enslave the peasants under the feudal lords. Although Liu Bang had suffered numerous defeats, he achieved the final victory because he represented the interests of the newly emerging landlord class and adopted some policies that met some of the peasant's demands. The reason for the differences in their fates lie in the fact that one was the representative of the progressive forces and the other was the supporter of the decadent forces. Wang Anshi and Du Mu reached different conclusions because they had different appraisals of the situation at that time. One understood clearly the "inexorable" trend of historical development while the other completely failed to notice it. Naturally, there were also instances where the decadent forces "rose again" and "staged a comeback," but that was due to the force in power at that stage being more decadent than the one that had been defeated earlier. Thus we can see that a correct analysis of the situation in a given historical period is a fundamental basis for a correct understanding of the possibility of the decadent forces "staging a comeback."

Will the counterrevolutionary clique of the "gang of four" that has been smashed by the party and the people return to power? In the last few years many people showed great solicitude about this question. However, our party Central Committee is always very sober and has constantly kept great vigilance. In order to prevent the "gang of four" from staging a comeback, our party has led the people to adopt a series of resolute measures. Politically, we have thoroughly exposed the "gang of four" in its true antiparty and antipeople counterrevolutionary colors and have carried out just historical trials of their countless crimes. Ideologically, we have thoroughly criticized and eliminated the "gang of four's" reactionary fallacies and are continuously eliminating their pernicious influence in various fields. Organizationally, we have thoroughly destroyed the "gang of four's" factionalist setup and have stipulated that anyone who began his career by following the "gang of four" in rebellion and anyone who entertains serious factionalism or who has participated in beating, smashing and looting must not be admitted into the leading groups at various levels. If already admitted, he must be resolutely dismissed from the leading groups. As for those who have committed mistakes by following the "gang of four," we have handled their cases in different ways in accordance with the specific natures of their cases and in accordance with the party's policies. By so doing, we have educated and reformed them rather than beating them to death with a big stick. Thus, we have united the majority of them and isolated a few obstinate elements. Now we can safely say that we have already thoroughly destroyed the foundation on which the "gang of four" depended for its existence. Through exposing and criticizing the "gang of four" and handling their cases, we have vigorously educated the broad ranks of cadres and the broad masses of people and made them understand that in our society those who entertain ambition and use schemes and intrigues to achieve this ambition will certainly come to no good end.

Now the key lies in whether we who are in power will live up to the expectations of the people. It will be dangerous, if we who are in power prove to be more rotten than the rotten force we have overthrown or if we commit irreversible mistakes. If we do not do so, it is only a dream that any rotten and degenerate force could try to stage a comeback and restore their rule. How can the "gang of four" be an exception! Therefore, we should educate the broad ranks of our full-time cadres in this historical materialist viewpoint, pay close attention to maintaining our political conformity with the party Central Committee, ensure that we do not commit serious mistakes concerning the political line, strive to prevent and overcome various corrupt practices and maintain our loyalty to the party and the people. By rectifying the party style, we mean essentially that all the cadres in power should have good party style. We should do this educational work well. Once the party style is really rectified, who will follow the "gang of four," even if the ghost of the "gang of four" is still wandering here and there? We must see that the leading group of our party Central Committee is strong and powerful and enjoys the confidence of the masses of people and that our party's line is correct and is supported by the masses of people. This constitutes a reliable guarantee against the comeback of any corrupt force. There certainly are some people in the party who do not live up to the expectations of the people, but their number is small. So long as we, the cadres who are in power at various levels now, maintain conformity with the party Central Committee and steadfastly combat various unhealthy trends so as to bring about a radical change in the party style, our party and state will have a great future and the prospects for socialism will be infinitely beautiful. "History will never retrogress." We should forever remember these well-known words of Mr Lu Xun.

ENHANCE THEORETICAL CULTIVATION, RAISE THE IDEOLOGICAL LEVEL--STUDY VOLUME 1 OF THE 'SELECTED WORKS OF LIU SHAOQI'

[Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 13-15

[Article by Wu Liping [0902 7812 1627]]

[Text] The recent publication of the first volume of the "Selected Works of Liu Shaoqi" by the Editorial Committee on Party Literature is a major event in the political life of our country. As an excellent textbook for the study of Marxism-Leninism-Mao Zedong Thought, it provides favorable conditions for further study of Marxist theory and for the raising of the ideological level. Reading the first volume of the "Selected Works of Liu Shaoqi" as an old student of Comrade Liu Shaoqi's, I was deeply touched.

Comrade Liu Shaoqi was one of the outstanding important leaders of our party and country. He dedicated all of his life's energy to the Chinese people's revolutionary cause. During his lifetime he fought resolutely to combine the universal theories of Marxism with China's revolutionary practice. He was both a practitioner of revolution as well as a theorist of revolution. His major achievements in the unification of theory and practice made a great contribution to the formation and development of Mao Zedong Thought. Works such as "How To Be a Good Communist," "Response to Comrade Song Liang," "Liquidate the Menschevist Ideology Within the Party" and "Speech to First Year Students of the Marxist-Leninist Institute" all devote considerable space to the discussion of how cadres, particularly leading cadres, should enhance their theoretical cultivation. The study of these works in the light of practice in the four modernizations is undoubtedly of great practical significance.

Comrade Liu Shaoqi believed Marxist theory to be a weapon that could be used to investigate and resolve all questions. A leader who fails to enhance theoretical cultivation will be unable to correctly recognize and resolve problems encountered in the course of revolutionary struggle and there arises the danger of confused bearings and deviation from the proletarian revolutionary stand. This is to say that the existence or absence of Marxist theoretical cultivation is an important question that relates to the success or failure of revolution. In March 1943, Comrade Shaoqi and I went to southern Jiangxi to organize an upsurge of production in the tungsten mines. After arriving at the mines, Comrade Shaoqi used ordinary language to explain Marxist theory to the workers and used correct ideology to guide the workers' actions. Production at the tungsten mines was quickly raised, which helped to support the revolutionary cause. Comrade Shaoqi often said: Only when the party is led by an advanced ideology will it be able to fulfill its role as an advanced fighter. Since revolutionary action is guided by revolutionary theory, if the theory is correct the action will be correct and the revolution will succeed. Otherwise, the revolution will be doomed to failure. However, there are a few comrades who do not entirely understand Comrade Shaoqi's viewpoint. Some comrades believe that as long as the fighting is courageous and the work enthusiastic there is really no need to study revolutionary theory. To counter this viewpoint Comrade Shaoqi would always carry out earnest and patient education. After affirming that revolutionary tenacity and fighting courage are valuable qualities that every Communist Party member should have, he would also point out that only when the question of how effective revolution is to be made and how correct struggle is to [be] carried out have been correctly resolved through the study of theory is it then possible to achieve revolutionary victory.

During the initial period following the foundation of our party, there developed in the party an atmosphere of opposition to theoretical research generated by an excessive emphasis on the experiences of actual combat. It was also as if there were no need for theoretical study and as long as there existed some experience of actual combat the revolution could be guided toward victory. The existence of this erroneous thinking seriously influenced efforts to raise the ideological level within the party. Comrade Shaoqi often used the lesson learnt from this period of party history to arouse cadres' enthusiasm for theoretical cultivation. He said: Our party has one major weakness, which is that ideological preparation and theoretical cultivation are insufficient. The repeated defeats suffered by our party in the past have all been due to failures in guidance. Mistakes in the guidance of the revolutionary cause have caused us to suffer grievous losses and have led to partial and sometimes unnecessarily serious damage to the revolutionary cause. It is because of this that from the Yan'an period onward Comrade Shaoqi repeatedly raised the question of enhancing the theoretical cultivation of cadres. It was to enhance the theoretical cultivation of cadres that on the eve of the founding of the People's Republic the party Central Committee established a high-level party school that was named after the Marxist-Leninist Institute in Yan'an and had Comrade Shaoqi as its president. From the speech given by Comrade Shaoqi at the beginning of the school term to the first class of students, we can see the importance he attached to the raising of the cadres' theoretical cultivation. In the speech Comrade Shaoqi related his own personal experiences, giving a moving and profound explanation of the importance of theoretical cultivation. He said: During the course of the revolution there have been many regrettable moments; what we must do now, however, is not regret past events but prepare and study for the future. The Chinese revolution has now succeeded and it simply will not do not to study. Before in the mountains things were still simple; now that we have come down from the mountains and entered the city the questions are far more complex. If we want to run the whole of China, things will be even more difficult. Now that the revolution has succeeded it is especially important that we do more reading of the works of Marx and Lenin and the works of Chairman Mao, and further familiarize ourselves with revolutionary theory; otherwise, it will be impossible to do our work well and we may even make mistakes.

If one studies the teachings of Comrade Shaoqi in the light of the practice of the 32 years that have passed since the founding of the People's Republic, one cannot help but feel admiration. It cannot be denied that during the period before and just after the founding of the People's Republic our cadres made considerable theoretical preparation and were exceptionally successful in their work to manage the whole of China. In general, however, our cultivation of the theory of socialist reconstruction--including the cultivation of knowledge in the fields of politics, economics and culture--has been less than complete. This is an important reason for us having taken several wrong turns over the past 30 or so years. Happily, since the 3d Plenary Session of the 11th CCP Central Committee our party has revived the fine tradition of emphasizing the study of theory, cleared up the influence of leftist errors on our party's guiding ideology, and pointed out a correct road for socialist reconstruction that suits the conditions in our country. The "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC," adopted by the sixth plenary session, gives a scientific summary of our party's merits and demerits, gains and losses since the founding of the People's Republic. The recently held 4th Session of the 5th NPC also adopted Comrade Zhao Ziyang's government work report and put forth the ten principles for future economic construction. This shows the great concern our party has for Marxist theoretical cultivation and expresses the relatively mature knowledge the party has of our country's socialist construction.

At the same time as emphasizing the need to enhance cadres' theoretical cultivation, Comrade Shaoqi also stressed that theory must be both connected with reality and united with practice. He said: "Marxist theory is a theory that was formed in revolutionary practice and also a theory that serves revolutionary practice. As long as revolutionary practice is closely integrated with our study, use and mastery of theory it will be possible both to understand the internal connections of things around us and to determine the correct line of action. Comrade Shaoqi offered incisive criticism of certain representatives of dogmatism, pointing out that they have acquired only a superficial knowledge of certain Marxist phrases and had completely failed to study the essence of the spirit of Marxism. While they may have read Marxist works, they are neither able to use the theories and conclusions of these Marxist texts as a guide for action nor to employ them in their real and concrete work. They derive satisfaction from being able to recite selected theories and conclusions and pose as "real" Marxists. In actual fact, however, they are not real Marxists at all as their methods of action have nothing in common with those of Marxism.

For Comrade Shaoqi successfully study and investigation were the most important aspects of the unity of theory and practice. He believed that only by carrying out down-to-earth study and investigation, by attentively listening to the suggestions and criticism of the masses, by carefully examining actual problems in life and work and by carefully summarizing lessons drawn from practice is it possible to discover whether one's understanding and use of Marxism are correct or to discover and correct one's own failings and mistakes. Only in this way can one's work be improved. Comrade Shaoqi solemnly criticized the inability of dogmatists to use Marxist theory in accordance with the changes in objective conditions; and pointed out that their decisions on policy and direction derived not from an examination of the surrounding situation but from identical or similar events found in books or history. In practice they are idealists. Comrade Shaoqi's criticism of dogmatism still has instructive significance for us today. As Comrade Qiaomu has pointed out, failing both to acknowledge the historical necessity and victorious practice of China's revolutionary development and to accept a series of discussions by Lenin before and after Russia's October Revolution and the new development of international socialism in the 20th century, some people have over the past few years made dogmatic statements that socialism must be built on a foundation of highly developed socialized production and must eliminate the production of commodity products. On the basis of this, they conclude that China's economy is backward and that it is neither possible nor desirable to establish socialism. Surely people, who propagate such mistaken views might have something to learn from Comrade Shaoqi's criticism.

Comrade Shaoqi believed that it was not at all easy to successfully integrate theory and practice as it required an end to all lazy thinking. He said: If one is to understand a complex question or a truth, it is essential that one be both rigorous and independent in spirit and work. Whenever Comrade Shaoqi judged whether a leading cadre was qualified or not he would always use the ability to make independent decisions as an important criterion. He often said that if one wants to be a good cadre qualified for leading work, one must be able to make independent decisions. Anyone who is unwilling to take on hard work alone will be unable to do a good job of anything. For this reason, in addition to firmly upholding the guiding principles of Marxism and resolutely implementing the line, principles and policy of the Central Committee, it is necessary to go deep among the masses, to do painstaking investigative work, and to do one's utmost to closely integrate Marxist theory and the principles of the Central Committee with the actual conditions of each area and each unit. This unity of Marxist theory and practice is an ideological approach and method of work that was consistently and steadfastly upheld by Comrade Shaoqi. During the early period of the war of resistance against Japan, Comrade Shaoqi first made a rapid breakthrough in the north China region, mobilizing the broad masses of the people against the Japanese. This was achieved through an examination and understanding of favorable opportunities. Afterward he went to central China, where he formulated a correct political and military policy on the basis of the correct principles of the Central Committee and the actual conditions in the area, and managed to rapidly establish firm democratic bases of resistance against the Japanese in Jiangsu, Zhejiang, Anhui, Henan and Hubei provinces. All this was the result of Comrade Shaoqi's efforts to firmly uphold the unity of Marxist theory and practice and his full use of the spirit of individual creativity.

Comrade Shaoqi also placed a great deal of emphasis on the question of combining theoretical cultivation with ideological cultivation. He believed that a truly qualified leading cadre must have both theoretical and ideological cultivation and should be able to combine transformation of the objective world with the transformation of the subjective world. He said that we must change ourselves and develop our proletarian ideology not only through revolutionary practice, but also through the study of Marxist theory. Soon after the beginning of the war of resistance against Japan, our party grew in strength and these party members were undoubtedly the outstanding daughters and sons of the Chinese people and were the advanced element of the proletariat. However, in old China there existed an exploiting class as well as a vast class of small capitalists and, owing to the differences in background and motives of those entering the party, all kinds of nonproletarian thinking unavoidably entered the party. For example, some cadres are always seeking the limelight or hoping to be individual heroes, others are individualistic or selfish in their thinking and there is even a minority who share the ideology of the exploiting class. In this way various ideological differences have emerged within the party and unhealthy trends and evil practices have begun to spread, causing controversy and dissension to arise within the party. How party members, particularly party cadres, should overcome all types of nonproletarian thinking is now an important problem that must be solved. Comrade Shaoqi did considerable work on this question of overcoming nonproletarian ideology within the party. Comrade Shaoqi said: When studying Marxist theory one must correctly combine this study with ideological cultivation and should use Marxist-Leninist thinking to resist and overcome all forms of nonproletarian thinking.

Comrade Shaoqi often said that only when one has a correct viewpoint is it possible to study and use Marxist theory. The correct viewpoint is the proletarian viewpoint. Without a clear and firm proletarian viewpoint and without a correct and pure proletarian ideology it is impossible for a Communist Party member either to thoroughly understand and truly master the methods and theory of Marxism or to use them as weapons in revolutionary struggle. That is to say, for one to have relatively good cultivation of Marxist theory a steadfast proletarian viewpoint is absolutely essential. Or put in another way, if a Communist Party member neither diligently studies the theory and methods of Marxism nor uses Marxism to guide his own thinking and action it will be impossible for him to either resolutely uphold the proletarian viewpoint in all revolutionary struggle or to ever embody proletarian ideology. Only through a serious understanding of Marxist theory is it possible to consciously consolidate, strengthen and develop this kind of proletarian viewpoint. We should approach all types of thinking and suggestions within the party by first clarifying which is correct and favorable to the party and revolution and which is incorrect and damages the party and revolution. In this way we can decide what to praise and what to oppose, how to raise and develop proletarian righteousness and how to resist all unhealthy trends; we will learn not to fear necessary struggles within the party and not to tolerate the development of any form of mistaken thinking or unhealthy tendency but will struggle resolutely against them; we will be able to combine a clear unwillingness to compromise on matters of principle with flexible methods of struggle and the spirit of patient persuasion, and in the course of long-term struggle we shall be able to educate, criticize, train and transform those comrades who have committed errors but are not completely incorrigible. Comrade Shaoqi's discussions on the need to overcome all forms of non-proletarian ideology through the enhancement of leading cadres' theoretical cultivation not only played a positive role in the establishment of our party but also have important practical significance today.

While 10-odd years have passed, the important question still lies in the study of Marxist theory. In the past Comrade Shaoqi urged us to study Marxist theory in order to "run the whole country"; today in this new historical period the four modernizations and the "renovation of China" also demand that we act according to Comrade Shaoqi's demands and study Marxism. Only by continuing to raise the level of cultivation of Marxist theory will we be able to guarantee that all our future work is successful, that we do not repeat past mistakes and that the cause of our country's socialist construction moves forward steadily and effectively.

IT IS NECESSARY TO PAY GREAT ATTENTION TO THE STUDY OF MARXIST THEORY--AFTER READING LIU SHAOQI'S 'REPLY TO COMRADE SONG LIANG'

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 16-18

[Article by Yu Haocheng [0060 3185 2052]]

[Text] In his article "Reply to Comrade Song Liang" written 40 years ago, Comrade Shaoqi stated that our party was not well prepared in theoretical work. He held that in addition to the general practice of opposing theoretical study which existed inside the party in its early stage and which had prevented our party's theoretical level from improving, there were three other factors which had given rise to this problem: 1) The period since the introduction of Marxist works into China was not long, whereas Marxism had already been disseminated in Europe for nearly a century; 2) The moment after it was founded, the Chinese party was drawn into a great and practical revolutionary struggle, not having enough time for doing theoretical study and for summing up its experience in carrying out struggle; 3) Not much about China was mentioned in the works of Marx, Engels, Lenin or Stalin. Therefore, it was especially difficult to use the principles of Marxism to explain and guide the historical practice of Chinese society. Comrade Shaoqi held that for these reasons, and especially because our party had not made sufficient efforts to this end, it had not been able to overcome its weakness of lack of theory even though our party had had rich experience in practical struggle.

"Reply to Comrade Song Liang" was written in 1941. This was followed by the rectification campaign throughout the whole party. Party members and cadres were educated in Marxism-Leninism, and revolutionary experiences and lessons were summed up in the light of the party's history. Making investigations and studies, seeking truth from facts and integrating theory with practice became our party's work style. Consequently, a foundation for winning the victory of the new democratic revolution was laid. However, viewed from the situation of all the cadres of our party, we could not say that we had basically done away with the weakness of lack of theory.

After the founding of the People's Republic of China, our party, guided by Marxism-Leninism-Mao Zedong Thought, led the people of the whole country in the socialist revolution and socialist construction and made tremendous achievements. However, as stated in the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC," "new China has not been in existence for very long, and our successes are still preliminary. Our party has made mistakes, owing to its meager experience in leading the cause of socialism and subjective errors in the party leadership's analysis of the situation and its understanding of Chinese conditions. Before the 'Cultural Revolution' there were mistakes of enlarging the scope of class struggle and of impetuosity and rashness in economic construction. Later, there was the comprehensive, long-drawn-out and grave blunder of the 'Cultural Revolution.' All these errors prevented us from scoring the greater achievements of which we should have been capable."

Since the smashing of the "gang of four," especially since the party's third plenary session, things have indeed taken on a new aspect in theoretical work. Marx said, "How well theory is realized in a country depends on how well theory meets the needs of this country." ("Collected Works of Marx and Engels," vol 1, p 10) The reason theoretical work has made such headway is entirely because it has been suited to the needs of the revolutionary struggle and practical work.

At present, our party has been gradually establishing a correct road to build the socialist modernizations that is suited to our country's conditions. The 10 basic points of this road have been expounded in the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC." These 10 points are basically a summary of the positive and negative experiences gained since the founding of our country, particularly of the lessons drawn from the "Great Cultural Revolution." Under the present circumstances, does the situation of our lacking theoretical preparation and cultivation as mentioned in Comrade Liu Shaoqi's article "Reply to Comrade Song Liang" no longer exist? If all the cadres are taken into consideration, we should not be too optimistic in our estimation. We should understand that when we say that our party has already fulfilled the task of bringing order out of chaos during the period from the third plenary session to the sixth plenary session, we are talking about the party's guiding ideology. Viewed from the whole party's practical work in different fields, we have to continue to fulfill the task of bringing order out of chaos. Therefore, we cannot say that Comrade Liu Shaoqi's opinion is outdated. When we reread "Reply to Comrade Song Liang" today, we still find that it touches our hearts.

First, theoretical work still falls far behind the needs of practical work. We have not yet gone deep into many aspects of the great practice of realizing the four modernizations in our country and of the new situations and new problems we encounter in this practice, nor have we worked out solutions that are of great significance in giving guidance. We have not carried out thorough study of many important theoretical questions. We have not even done enough work in making comprehensive investigations and surveys and in systematically accumulating materials.

Second, the tendency to look down on theoretical study and research still exists to varying degrees among some comrades in some places. As pointed out by Comrade Liu Shaoqi in his article "Reply to Comrade Song Liang," these comrades seem to think that they can be content and lead the revolution to victory so long as they have experience in practical struggle and that they do not need profound theoretical study. They seem to think that the Marxist theory can be mastered without being seriously and thoroughly studied over a long period of time. Some comrades think that theoretical study, especially theoretical study of social sciences, is not of much use and that it is not essential. The phenomenon of "attaching importance to science and engineering and looking down upon literature and history" in the society may be related to this. Some people seem to think that the four modernizations need only natural sciences and not social sciences. It seems that it will be enough just to carry out economic readjustment and to develop production, whereas political reforms and promoting democracy are of no consequence. It seems that it is enough just to build a material civilization and the building of a spiritual civilization is an unnecessary move. This kind of understanding is apparently one-sided and erroneous.

Third, discussion and debate of theoretical problems have not been sufficiently carried out. There is a kind of habit formed over many years. It seems that only a certain leader is responsible for developing revolutionary theory. Whenever we come across a problem, we can only try to find a ready solution to it in classical works. We need not use our brains at all. Even if we have some ideas, we dare not put them forth. This study style of "daring only to repeat the words of saints" has caused theoretical work to stagnate or even shrink. Marx once said, "Truth is established through debate." ("Complete Works of Marx and Engels," vol 28, p 286) Comrade Mao Zedong also said, "Only by comparing can one distinguish. Only by making distinctions and waging struggle can there be development." Without controversies with different views, truth cannot be found, nor can it be developed. In his speech given at a meeting to discuss ideological guidelines for theoretical work, Comrade Deng Xiaoping said, "We must resolutely implement the policy of 'letting a hundred flowers blossom and a hundred schools of thought contend' in studying and discussing ideological and theoretical problems. We must resolutely implement the policy of not seizing on mistakes, not sticking political labels on others and not using the big stick. We must resolutely implement the policy of emancipating the mind, doing away with superstitions and proceeding from reality in everything. All these aspects were decided at the third plenary session. I have now restated them, and no wavering is permitted." Truly implementing the above policies is the key to the prosperity and development of science and theory.

In our country, upholding the guidance of Marxism-Leninism-Mao Zedong Thought is incontestable. But is it permissible to probe into and discuss Marxism-Leninism-Mao Zedong Thought? The answer should be positive. The reason is that if we want to uphold Marxism-Leninism-Mao Zedong Thought, we must answer the question what is Marxism-Leninism-Mao Zedong Thought. People's understanding of this question varies. Therefore, much discussion is needed. Not only discussion but also criticism is permitted. Comrade Mao Zedong said, "Since Marxism is accepted as the guiding ideology by the majority of the people in our country, can it be criticized? Certainly it can. Marxism is scientific truth and fears no criticism. If it did, and if it could be overthrown by criticism, it would be worthless." "Marxists should not be afraid of criticism from any quarter. Quite the contrary, they need to temper and develop themselves in the teeth of criticism and in the storm and stress of struggle." ("Selected Works of Mao Zedong," vol 5, p 391) The main problem on the theoretical front today is that the discussion of theoretical problems has not been correctly carried out. Some comrades regard themselves as infallible and will not listen to any criticism. The moment some comrades hear views which differ from theirs, they usually silence them in an oversimplified and crude way and will not solve a problem by means of discussion on the basis of equality. This attitude runs counter to Marxism and is harmful to defending and developing Marxism.

In order to ensure that theoretical work can be carried out more normally and healthily and without interference, we must pay attention to differentiating theoretical study from theoretical propaganda. Newspapers and radio stations should, under the leadership of the party, unfold lively and feasible discussions on correctly understanding and implementing various policies and principles of the party. This is conducive to carrying out thorough propaganda and education among the cadres and the masses. But this kind of discussion should not become an open debate of the right and wrong of the party's basic policies and principles, in order to avoid causing confusion among the masses. Similarly, for the sake of listening to opinions from all quarters, questions involving policies and principles or some important political questions that have not yet been decided on by the Central Committee may also be openly discussed in newspapers if the Central Committee has agreed to do so. But we must be ready to make conclusions within a certain period of time during this kind of discussion so that the cadres and the masses will not be at a loss as to what to do or to act as they think correct. Otherwise, it is not advisable to have such discussion. Even greater prudence is needed in publicizing policies and important measures which are still in an experimental stage. We must objectively and comprehensively reflect the situation and should draw hasty conclusions.

The "Resolution of Certain Questions in the History of Our Party Since the Founding of the PRC" has pointed out, "It is imperative for the whole party to engage in a more diligent study of Marxist theories, of the past and present in China and abroad, and of the different branches of the natural and social sciences." Let us seriously study the works of Marx, Engels, Lenin and Stalin and the works of Comrades Mao Zedong, Zhou Enlai and Liu Shaoqi, strive to go deep into theoretical problems that emerge one after another in reality and make new contributions in making use of and developing Marxist theory, studying new situations and solving new problems.

SOCIALIST HUMAN RESOURCES SYSTEM ENGINEERING

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 19-22

[Special commentary by Qian Xuesan [6929 1331 2773]]

[Text] In our socialist country, the people are the masters. The state is responsible for the people and has the duty to cherish the entire people, organize the people, bring the enthusiasm of the people into the fullest play, give scope to the intelligence and wisdom of the people, and build socialism in the interests of the people. What we mean by the people is the workers, peasants, intellectuals and other patriotic people. Thus the concept of talented people has been expanded. What we mean by talented people refers to the talents and capabilities of the people in all trades and professions among the people rather than the so-called geniuses. Such a question of talent did not exist in any society in the past and only under socialism can it be put to the fore. So it is a brand-new question.

On this important and wide-ranging question, what I am going to touch on is naturally limited and premature. However, I would like to air my view so that everyone can discuss the question together.

I

Where do man's abilities come from? Are they inborn or acquired after birth? The studies of modern psychology and physiological psychology have shown that most of man's abilities are acquired gradually after his birth, namely, acquired step by step through practice. An animal is different from man. Its abilities are mostly hereditary. A cat's instinct is to catch mice and a worker bee instinctively gathers honey. Man's "natural gift" lies, as it is said, in the extremely great plasticity of man's brain. A man studies and enhances his abilities and wisdom all his life. Comrade Zhou Enlai said: "Learn, work and remold yourself as long as you live." Facts are really like this. This is a scientific thesis. Then do we hold that there is no difference between one man and another? Certainly not. For instance, a man is possibly born with hereditary or embryonic defects, but this case constitutes a tiny minority. What is more important is that the immense variety of things and practice a man undergoes after his birth and the varied education and practice he receives later are the chief causes of the difference in men's abilities. It is a pity that up to now psychology and pedagogy have not found out a complete set of laws. Very often people say that this child is clever and that child is stupid, but they do not know why. To find out this law, it is necessary to engage in the study of the science of thought. At present we have to rely on some incomplete "wise remarks of experienced persons" and on things like autobiographies of some people who have had very successful careers and famous scientists in developing the intelligence of children. Therefore, the science of thought as well as psychology and pedagogy are really the foundation for developing intellectual resources. We must attach great importance to the study of these sciences. It is unfortunate that during the 10 years of internal disorder the work in this field was attacked and wrecked in varying degrees and the bad influence has remained to be felt up to this day.

Apart from intelligence, man's ability consists of knowledge. That is to say, the recorded practice and experience of mankind and the knowledge of the objective world derived therefrom are summarized into branches of learning. This knowledge concerning branches of learning can be taught to the new generation and to those who need it. Either the teachers give lectures on the knowledge and the students attend these lectures, or the students master it through self-study. By education, we mean chiefly this matter. The importance of education in developing man's ability is intimately known to all.

By dividing intelligence and knowledge into two separate parts, I mean to stress that there is a difference between the two. How to develop man's intelligence has remained an obscure problem up to now, but it is relatively easy to increase one's knowledge. There is a complete set of effective measures in this respect. Of course, intelligence and knowledge are related. Those people who show a lot of intelligence can acquire knowledge very quickly. Substantial knowledge contributes to the improvement of intelligence. In increasing his knowledge and experience, instead of depending mainly on his intelligence, a man has to study.

After a man is born, no matter how, his ability varies owing to different experiences and different conditions for study. The difference is manifested in two fields: one is that man's ability might be great or small, and the other is that men's abilities are different. The former refers to the fact that the results of work in a certain field are different, different in both quality and quantity. The latter refers to the fact that men's abilities are different. Some people can do certain work well in both quality and quantity, but they might do work in another field badly in both quality and quantity. Therefore, so far as the state is concerned, it is a big problem how to put the most suitable people in the most suitable work posts. This is a question of using people and central to this question is judgment of people. People like to mention the historical story of Bo Le's spotting a horse that could cover 1,000 li a day, and even call it the theory of Bo Le. Quite a few young people consider themselves to be

1,000-li horses in the march toward science and always complain that they have not been spotted by a Bo Le. For this reason, they take delight in talking about this question. We must take a scientific approach to it.

First, a 1,000-li horse is only one type of horse. A horse that covers 1,000 li a day might not necessarily compare favorably with a draft horse in drawing a heavily laden cart. Building socialism requires all kinds of talented people. So a 1,000-li horse is not necessarily more superb than any other horse. This depends on the type of work. The so-called "geniuses" trumpeted by the old society frequently did not recognize the talents in all trades and professions among the people. This is a manifestation of narrow-mindedness and can also be said to be a class prejudice. We need not only 1,000-li horses and Bo Le's who can spot them but also other types of horses and people who are good judges of them.

Second, was Bo Le's ability magical? Of course not. Invariably, objective things have their own laws. We must understand these laws. Is it so difficult to understand the laws? It does not seem so. In the scores of years of revolutionary struggle, has our party not discerned and selected large batches of cadres from among tens of thousands of revolutionaries and not promoted fine leaders from among them? Has it not been very successful? The success in the promotion of revolutionary cadres and revolutionary leaders shows that it is possible to master the laws of judging fine people who are engaged in revolutionary work. If we can understand one aspect of a thing, we will be able to understand two or three other aspects.... The question of knowing people covers the study of the characteristics of able people in all trades and professions in the course of building socialism so that we can discern these characteristics promptly and accurately. This is the real task of the theory of human resources. The scope of study of the theory of human resources is extensive, and it must not be confined only to discerning people qualified in scientific research.

II

Above, we have studied the differences and changes between one man and another in terms of the process of the development of man's ability. That is so not only in terms of experience and practice but also in terms of physiology. A middle-aged man is different from a young man, and needless to say, being physically weak, an old man is naturally different from a middle-aged or young man. Therefore, the ability of one man and another is not only different, but changes as a man ages. The work which best suits a young man will not necessarily suit the same man in his middle or old age. In order to suit a person to his work and put the most suitable persons in work posts, a flow of personnel must be allowed. This state of affairs is commonly seen in foreign countries, where no one remains for a lifetime in one position.

There is another reason for changes in work, viz, that science and technology are advancing and society is developing, thus resulting in the constant evolution of the affairs that man must handle. With the changes in work fields, those departments which formerly needed many hands have become departments which need only a few hands, and posts which did not exist in the past have now emerged. This state of affairs might not have been noticeable in feudal society, for history progressed slowly at that time and there were few changes in a man's lifetime. Now, things are new and different every day. Changes take place in the period of scores of years and even in a very few years. Great changes are expected to take place in our country between now and the year 2000.

Owing to the above-mentioned reasons, to put the most suitable persons in the most suitable positions, the positions of personnel must not be fixed. In our socialist country, the problem is how to realize the flow of personnel. Must there be a spontaneous flow of personnel and must people look for jobs themselves? This will lead to social chaos and is therefore not desirable. This work should be rationally arranged by the state in a planned way by taking into consideration the situation as a whole.

Another problem in China's personnel work which requires a solution is how to arrange the retirement of cadres in their old age and how to take care of their livelihood and arrange appropriate activities for them after retirement. At present, China has about 200 million cadres and they will possibly grow in number with the development of the socialist cause. If we say that a cadre will retire after he has worked for the people and the country for 40 years and live, on average, 10 more years after retirement, the ratio will be 4 to 1. Hence, there will be 5 or 6 million retired cadres in our country. This figure does not include the retired staff and workers plus the retired workers of the enterprises under the system of ownership by the whole people. In the near future the number of retired personnel that the state will have to take care of will increase. Our present rules and regulations in this regard are imperfect. The arrangement of life and appropriate work for the retired personnel is mostly delegated to the units they belong to, thus becoming a burden to the units and resulting in failure to give full scope to the roles of the retired personnel and to let them really have a new life and serve the people within their power while spending their remaining years in jubilation. The state assumes full responsibility for providing for the retired personnel. This is a manifestation of the superiority of the socialist system. We must take a step further and look upon these personnel with rich experience as the valuable treasure of the country rather than as a negative burden. Only in doing so can the inherent superiority of socialism be brought into full play.

The existing state of affairs in China in which the various units separately handle their own affairs in personnel work exist not only among the retired personnel but also among the youths waiting for jobs. Drawbacks have cropped up with this method. In fact the phenomena of decentralized management can be found widely. For example, apart from a small number of senior cadres who are subject to the centralized administration of the central authorities, the overwhelming majority of cadres and the whole body of workers should be taken care of by their respective units. The institutions of higher learning which train young people are only partially subject to the direct jurisdiction of the Ministry of Education, and quite a few institutions of higher learning are put under the management of the various departments under the State Council and various provinces, municipalities and autonomous regions. The overwhelming majority of technical schools at the secondary educational level are managed by the various departments themselves. On-the-job study has become the exclusive business of the departments concerned. Assignment of jobs or positions to people who have received an education is, therefore, also put under decentralized management. So the practice of "a waterfront pavilion getting the moonlight first"--benefiting because of the favorable position one is in--is difficult to avoid.

In my opinion, the emergence of this state of affairs is understandable. After all, our country was established directly on the basis of the feudal society with more than 2,000 years of history and on the basis of a semifeudal and semicolonial system with more than 100 years of history. In the interval, there was no social system based on mass production. Only 20 years or more have elapsed since the basic completion of socialist transformation; this is too short a time. In between there were also the "10 years of internal disorder." However, the drawbacks of this decentralized management system have become very pronounced. I had previously appealed that reforms should be made, that the training, promotion and use of personnel be put under centralized management, that a good job be done in cherishing as well as organizing and taking care of 1 billion people, and that the people's abilities should be enhanced, on the one hand, and that suitable posts be arranged for everyone, on the other hand, so that everyone could make the best use of his ability. This is also a matter of prime importance in building socialism and also an important matter which did not exist in the past society and other countries and which demands our pioneering efforts.

III

To train, promote and use 1 billion people and arrange their retirement and life after retirement well, it is imperative for the state to establish a unified, centralized and graded management system. Is this work too complicated? Can it be managed well? Let us make a concrete analysis of the following things:

First, our party has 60 years of experience in governing the cadres, of which quite a few experiences have been successful, as we mentioned above. There has also been quite a lot of experience in the 32 years since the founding of the PRC. We must earnestly sum up these experiences.

Second, we can use our good experience in using people and the experience of foreign countries in training, promoting and using talented people for reference. Because the social systems are different, these experiences must not be copied and applied everywhere indiscriminately and mechanically. However, the experiences of the capitalist countries in using people have been obtained under the conditions of socialized mass production and of highly developed science and technology. For instance, personnel are released from their regular work to take part in short-term training and are promoted to higher positions based on the results of their studies. This method goes around and begins again. Thus more professionally competent people are selected time and again. Those who have failed to do their work satisfactorily are transferred to new posts where they can give scope to their specialities. This method is scientific and we must use it for reference.

Third, the management technique of keeping dossiers on cadres. Once a centralized and graded management system is in force, it will possibly be necessary to concurrently assess tens of thousands of people and to select the most suitable from the dossiers of tens of thousands of people. It does not really work to use the old method of leafing through the dossiers file after file. Now, there are electronic computerized systems for reviewing archives, and thus looking into archives becomes automatic. It works 10 million times faster than the method of looking into archives manually. So long as the conditions for selecting cadres are fixed, electronic computers can automatically select the most suitable people. Archives are recorded on tapes, which can be constantly replenished. The conditions of a man's work and the reactions and comments of the masses, his colleagues and leadership to him can be sent to the archives and added to his dossier through normal channels. This complete set of techniques has now been fairly well perfected and is available for use. So there is no need to worry about falling short of one's wishes and about being unable to manage the work well.

Fourth, to really begin this system in education work, not only must primary schools, middle schools, secondary technical schools, secondary vocational schools and institutions of higher learning be greatly developed, there must also be a great variety of all kinds of short-term training classes attended by people not engaged in production or not withdrawn from production. Is the organizational work of centralized management too elaborate? Like the previous question, the answer to this question is that the work can be wholly done by electronic computers and there are no difficulties at all.

Fifth, the modernization of teaching work can substantially raise efficiency and save money. This "education with electronic audio-visual aids" is already known to all. Lectures given by an experienced teacher with great learning who is an excellent teacher can be recorded and then broadcast throughout the nation with thousands upon thousands of students hearing them. Our television has now begun to adopt this method and has achieved marked results. In fact, this work is expected to be done better in the future. We can use synchronous earth satellites over the equator to rebroadcast television programs or we can go more directly and use the direct broadcasting television satellites on a synchronous orbit to broadcast educational programs with electronic audio-visual aids to any border region. This technology is readymade. Besides, the number of television sets is increasing in the countryside. Putting into practice this modern teaching method is no longer a matter within sight but beyond reach.

Sixth, the ability to discern talented people. This can also be summed up. The key to this question lies in finding out people who know the business. Bo Le could spot a horse that could cover 1,000 li a day, but he might not necessarily be able to distinguish other types of horses. It is not difficult for a professor of physics to spot a physics postgraduate student and to judge whether to enroll him as his student, because he knows the characteristics which a postgraduate of physics should possess; even if he fails to find the characteristics from the answers in the postgraduate's examination papers, he will solve this problem easily by speaking to the student face to face. So face-to-face speaking between experts and prospective candidates is a good method to discern talented people. This has been proved for a long time. Then must specialists in all kinds of fields be on the spot to judge and assess the detailed archives in using the techniques in the third and fourth points mentioned above? Of course not. There is now a new manmade intelligence technique operated by electronic computers called a "specialist system." This specialist system can draw on the methods of judgment and assessment of experts being fed into the computers and let the computers learn to manage the abilities of the experts. When the experts are not on the spot, the computers can do the work for them. So the question of judging people is not difficult to handle.

Seventh, systems science and systems engineering. It is an unprecedentedly large-scale organizational and administrative task to have the state assume all-round responsibility for training, promoting and using 1 billion people from birth to death. If this question were raised 40 or 50 years ago, people would have thought that the question was so extensive that they would not know where to begin. Now we have already entered the 1980's. The systems engineering developed during this stage and its pure operational research have become a mature discipline and are gradually forming a branch of learning--systems science. Wiith systems science it is not difficult to face the questions of governing socialist human resources which I have mentioned above. Our objects are in fact a giant system with 1 billion units. This system consists of a number of components, namely, educational subsystem, archive storage and retrieval subsystem, and retired personnel subsystem. Every subsystem consists of some levels. For example, the province is a level and the state is the highest level. Problems can be solved first in the lower level, but the solution of problems must not be confined to one level. When no satisfactory solution is arrived at, the problems can be advanced to a higher level and be handled there. So the whole system, the giant system, is still unified under the state's centralized management. Establishing and operating such a human resources system can be called socialist human resources systems engineering. By the term socialist we mean that this human resources system is based on the fundamental principles of socialism.

With the above-mentioned seven things which can be used to establish our human resources system and do concrete work, in my opinion, provided we realize the importance of the question of human resources to the building of socialism and are resolved to promote this work, then this brand new undertaking can be fulfilled in not too long a time because we have ready-made science and technology to use. Of course, in doing so we need some new equipment, and some investment is indispensable. Compared with the investments poured into the state's various capital construction projects, the investment in the completion of socialist human resources systems engineering itself is much smaller.

What can be attained is not necessarily just around the corner, but rather will take a certain amount of time. Besides, everything cannot always be perfect, leaving no problems to be solved. It will take time to start our socialist human resources systems engineering. Once it is established, it will still require constant improvement. The country is advancing and so is the socialist cause. Any established system invariably fails to keep abreast of the changes in reality. That is to say, the socialist human resources systems engineering can solve the problems of substantial importance, but it cannot solve all problems in the work of training, promoting and using talented people, and there exist contradictions in it. What should be done concerning the contradictions? In handling the contradictions, we must still rely on ideological consciousness and on taking the interests of the whole into account. In other words, it is of great importance to always persist in ideological and political work among the people. People look upon ideological and political work as the work of building the socialist spiritual civilization, and in fact the training, promotion and proper use of people's talents is also the work of building socialist spiritual civilization.

GIVE THE PEASANTS MORE AND BETTER SPIRITUAL NOURISHMENT

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 23-26

[Article by Zhou Weishi [0791 1550 1492]]

[Text] Amid the sound of gongs and drums to jubilantly celebrate bumper harvests in the vast countryside, the Ministry of Culture held a national meeting in recognition of advanced collectives and advanced workers in rural cultural and art work, thus ushering in a year of new developments in rural culture and art undertakings.

Since the 3d Plenary Session of the 11th CCP Central Committee, there has been now a vast panorama full of vitality in the rural areas throughout the nation, and the large numbers of commune members have been full of joy because of the gradual implementation of rural economic policies and the continuous perfection of the production responsibility system. Agricultural development is now on the upswing. This is an excellent situation rarely seen in many years. With the development of production and improvement in the people's livelihood, the broad masses of peasants have continuously raised new demands for improvements in cultural life. This has brought about a new situation in our country's rural cultural work and also has imposed new tasks on us.

Under the correct leadership and kind attention of the CCP Central Committee, the leadership at various levels and the vast numbers of literary and art workers have adopted positive measures to enrich the cultural life of 800 million peasants through all kinds of forms, have carried out education on collectivism and patriotism among the peasants and have encouraged them to struggle to build a new socialist countryside with a prosperous economy while enhancing their lofty spirit. In the past few years, the rural cultural and art undertakings have been greatly restored and developed and the rural cultural activities have been relatively enlivened. At present, there are nearly 90,000 rural film projection units, 3,000 county cultural palaces, over 1,500 libraries at county level and 27,000 commune cultural centers throughout the country. Over the past 2 years, financed by the state, 3,000 more commune cultural services have been set up and more than 3,000 cinemas and theaters in rural market towns have been rebuilt or built by relying mainly on the strength of the collective economy of the communes and their subdivisions. Between January and September of last year, the rural film projection units and the cinemas and theaters in rural market towns provided more than 16 million film shows to a total audience of 13.3 billion, which averaged 16 film shows per person. The vocational performing art troupes went to the countryside and put on 560,000 or more performances in 1980 and the number of performances staged by commune art troupes and amateur peasant troupes was even greater. Many cultural palace centers, and in particular cultural services, provide every cultural activity imaginable, including entertainment and study. There are not only recreational activities but also study guidance provided and technical research and sports meets in the cultural palaces and service centers. Their programs are substantial and colorful and are, therefore, warmly welcomed by the peasants. These cultural activities have met not only the demands for the cultural life of the peasants and enhanced their political consciousness, but also have played a positive role in developing agricultural production, consolidating the situation of stability and unity, changing the general mood of society and bringing up a new generation in the countryside. So, generally speaking, the rural cultural situation is good and substantial results have been made in rural cultural and art work. However, it must be soberly realized that the rural cultural work is still far from meeting the needs of the cultural life of the vast numbers of peasants. The peasants in some mountainous border areas have sighed that "We have no worries about food and clothing, but what we worry about is that there are no films or plays to see." This state of affairs exists rather widely. The peasants who have some cultural activities have voiced the opinion that "we do not have to worry about food, clothing and housing, but what we are anxious about is that the cultural activities are not adequate." The peasants in regions where the cultural activities are fairly rich also raise the demand: "We have become prosperous. We eagerly hope to see performances by leading and famous actors and actresses of the big troupes." Thus, it can be seen that to satisfy the new demands of the large number of peasants at the new stage is an urgent task confronting the leadership of the party committees at various levels and the departments concerned, and also a bounden glorious duty for the broad masses of literary and art workers who are determined to serve the people.

Ours is a big socialist country with a population of 1 billion, of which 800 million are peasants. Doing a good job of rural cultural and art work is of great significance to overall socialist construction and especially to the building of a spiritual civilization. Serving 800 million peasants is where the future of the development of various literary and art undertakings lies. There exists a large audience and body of readers and a vast cultural and art "market," and there is ample scope for utilizing the abilities of literary and art workers there. Only when a genuine and proper job is done in rural cultural and art work can we be regarded as having taken care of the peasants in satisfying the people's needs for spiritual nourishment. Developing rural culture and art work is not only a question of culture but also a question of politics. Only if rural culture and art work are done well can we create the necessary spiritual conditions for promoting cooperation between city and countryside, strengthening the worker-peasant alliance, and gradually reducing the difference between city and countryside and between industry and agriculture. Our multitudinous minority nationalities mostly reside in the vast countryside, mountainous areas and border regions. Only when a better job is done in rural culture and art work can the backwardness in the cultural development of the minority nationalities be brought to an end; this is a problem left over from history. In building culture in the border rural areas and pastoral areas, there is a serious need to resist capitalist and social imperialist cultural infiltration and to struggle against antagonistic ideologies and culture. This task is extremely arduous and requires long, hard struggle. Only in so doing can success be achieved.

In his report on government work delivered at the 4th session of the 5th NPC, Comrade Zhao Ziyang made a profound exposition of the relationship between socialist cultural and material development: "In the work of socialist modernization, we must strive for a high level of both material and cultural development. The two are inseparable. Only by doing this can we ensure the sustained growth of the national economy and the socialist orientation of material development." The experiences of quite a few rural communes and their subdivisions have proved, both positively and negatively, that doing a good job of cultural development is a guarantee for material development and can play a motive and promotive role; when things do not go well, it might play a negative role; abandoning cultural development means letting capitalist and feudal cultural trends spread unchecked. This will inevitably play a disruptive role in the rural situation of stability and unity. The view and opinion that regard rural cultural work as "singing and dancing, chatting and laughing, playing and fooling around and of being of no importance" and neglecting it are extremely harmful and detrimental to the all-round construction of a new countryside. We must proceed from a strategical perspective and from the great task of bringing up new socialist peasants who can get a good grip on the building of rural culture step by step. In particular, we must not ignore the building of rural culture in remote districts where feudal and superstitious activities are rampant and in frontier areas where the cultural struggle is acute.

In the present rural culture and art work, one striking new problem is unbalanced development; one prominent demand is to closely combine popularization with the raising of standards and to correctly handle the relationship between popularization and the raising of standards both in ideology and work. Comrade Mao Zedong pointed out: "By the raising of standards, we mean the raising of standards on the basis of popularization; by popularization, we mean popularization under the guidance of the raising of standards." The popularization of rural culture and art means giving more healthy, progressive and revolutionary nourishment to the broad masses of peasants and, proceeding from this, it is necessary to enrich their cultural life, foster their ideology and morality, arouse their revolutionary spirit, and at the same time raise their levels of science, education and health so as to bring into full play their roles in building the socialist material civilization and spiritual civilization. Our culture and art must not only suit the acceptance and appreciation abilities of the great numbers of peasants but also continuously foster and raise the levels of their acceptance and appreciation abilities so that they can steadily widen their realm of thought to include knowledge of aesthetic perception. By doing this we can achieve genuine popularization and really raise standards. The practices of indulging in self-admiration and cutting oneself off from the masses will not play any role at all. We mean this in terms of the interrelations between popularization and the raising of standards and the general goal. In terms of work, it is necessary to treat the relations between popularization and the raising of standards according to different cases, each having its own stress. Seen from the present situation in which rural cultural life is relatively animated but is developing unevenly, first and foremost, much work is still required in order to popularize it extensively. Take the structure of rural culture and art work for example. Throughout the nation there are still some prefectures, (municipalities, autonommous prefectures and leagues) which have no mass cultural palaces; a considerable number of counties have no libraries and cultural palaces; more than half of the communes have not yet set up cultural centers, and the communes which have set up cultural centers and initially formed cultural services are very few in number. Quite a few counties and communes and particularly those in mountainous border areas, the areas where minority nationalities reside, and the frontier regions have no cinemas and theaters; quite a few production brigades and production teams have no cultural rooms or clubs; in quite a few regions there are no places for the peasants, herdsmen and fishermen to read books and newspapers and no places for them to engage in recreational activities. Owing to the lack of genuine cultivation of the idea of serving the countryside, some localities and departments have attached insufficient importance to rural cultural and art work. For instance, some localities pay excessive attention to the construction of cinemas and theaters in market towns. This is of course correct, but they relax the leadership and management over rural film projection units, thus giving rise to the phenomena in which some film projection units only concern themselves with revenue and only want to show films in economically prosperous places which have good transportation services. There are also phenomena in which some vocational performing art troupes as well as actors and actresses are afraid of difficulties and hardships and unwilling to put on performances in the rural areas. Under these circumstances, although the localities with fairly good conditions have built new cultural facilities such as rural cinemas and theaters, they have not played their proper role in rural cultural services because there is no way to guarantee fixed performances or cultural activities. Therefore, it is imperative to proceed from actual conditions and get a good grip on popularization work. In accordance with the principle of adapting demands to possibilities, it is necessary to gradually develop more rural cultural facilities by relying chiefly on the strength of the collective economy of the communes and their subdivisions. Special consideration should be given to the needs of regions where peasants find it difficult to enjoy cultural life. The state should support them in this respect as much as possible. When performing art troupes go to the countryside, they must try their best to give performances in these regions.

The localities where the popularization work of the rural culture and art is done fairly well must put on their important agenda the raising of the standard of art cultivation of the cultural and art workers and the quality of art production. "The people want popularization and then the standards raised. They want the standards to be improved year by year and month by month." If we invariably cling to the pattern of "men, hands, mouths, knives, cows and sheep" and have not for a long time improved the ideological contents and the quality of art and technical level, our work will deviate from the practical requirements and from the people, and the masses will not want to see it and will voice many complaints.

The raising of the standards of culture and art, first and foremost, means improving the ideological content, the creative quality and the level of aesthetics. In regard to cultural administrative departments, it is imperative to exert strenuous efforts together with the various associations of the China Federation of Literary and Art Circles to grasp well creations and provide the vast numbers of peasants with more and better nourishment. Last year the Ministry of Culture called a symposium on creating rural subject matter and sponsored performances of traditional operas and quyu (folk art forms including ballad-singing and storytelling) before fellow artists, encouraged creations on rural themes and awarded a number of fine works. The propaganda and cultural departments of the CCP committees of various localities have paid close attention to creation in this field and are mobilizing and organizing writers and artists to go deep in the countryside, go down to grassroots units and immerse themselves among the masses to learn about the situation, observe and learn from real life and engage in creation. Many rural amateur writers are also enthusiastically carrying out creative work. In the past few years, great changes have taken place in the countryside. In the countryside a host of new people and new things, good people and good deeds have emerged, a scene of inspiring people with enthusiasm which can help up broaden our horizon and expand the ideological realm, thus creating very favorable conditions for creating rural subject matter and constantly improving the ideological contents and the quality of art. We believe that under the guidance of the policy of letting a hundred flowers blossom and weeding through the old to bring forth the new, large numbers of fine works that reflect rural real life will constantly emerge.

Another question is the improving of professional skills. The ways and means for raising professional skills are multifarious. Over the past few years, various localities have selected a number of key leadership and professional members of the art and cultural palaces, county vocational performing art troupes, libraries and film projection units and allowed them to engage in advanced studies in their cultural areas, sponsored various vocational training classes or training classes in rotation so as to improve the vocational levels of the key members of the grassroots literary and art activists; the vocational cadres of the art palaces, libraries and film companies have directly gone down to give guidance in vocational study of training to the communes and their subdivisions. These practices are desirable. It is necessary in the future to sum up the experiences in this respect and push these practices forward a step further on the existing foundation and carry them out in a better way.

Here I would particularly like to discuss the questions of the vocational performing art troupes persisting in going to and performing in the countryside and mountainous areas and to the raising of level professional work. The distribution of China's performing art troupes is very irrational owing to historical and practical causes. The vocational performing art troupes are too concentrated in some big and medium-sized cities. Over the past few years, although the performing art troupes of the big and medium-sized cities have more frequently given performances in the rural areas, they have not paid due attention to this work, resulting in an abnormal phenomenon in which there has been a fall in the attendance at performances in cities put on by some opera troupes, very few vocational performing art troupes have staged performances in rural areas and the peasants have not been able to see any operas. In the future, all kinds of vocational performing art troupes at various levels must organize a contingent of handpicked actors and actresses of great attainment and go to the countryside to give performances to the large numbers of peasants with simple and convenient stage properties and good programs. This must be made a regular practice and systematized. We hold that the troupes at central, provincial, municipal and autonomous regional levels should devote 15 to 30 percent of their time in a year to giving performances in the countryside and mountainous areas; those at municipal level, about half of their time, and those at prefectural and county levels at least two-thirds of their time to putting on performances mainly in the countryside (pastoral areas). Since the art types are different, the number of performances might also vary. The performing art troupes have at present difficulties acquiring revenue. Together with the concerted efforts of the financial, agricultural, and forestry departments, quite a number of provincial and municipal cultural departments have drawn a certain amount of undertaking funds with which they gave awards or policy subsidies to the troupes which have done well in the work of giving performances in the countryside and mountainous areas. These methods and experiences deserve study and recommendation.

In going down to the countryside, the vocational performing art troupes have three tasks: to meet the cultural needs of the peasants, improve their ideological level and the level of art appreciation; to provide vocational coaching to professional art personnel and the key amateur literary and art activists and raise their professional skills; and to learn from the vast numbers of peasants, grassroots cultural and art workers and amateur literary and art activists and improve their ideological quality and artistic levels. Of course, the aim for the vocational performing art troupes to go down to the countryside is chiefly to do popularization work, but this does not, in the slightest degree, mean that they can weaken their own tasks and roles in the work of raising standards. The performing art troupes of big and medium-sized cities, in particular, must all the more put the tasks of the raising of standards to an important position. These kinds of performing troupes have numerous famous actors and actresses, strong creative forces and high level of performance. They must not only give the peasants brilliant programs but also play an exemplary role for the prefectural, county, commune and amateur opera troupes and shoulder the tasks of improving professional skills of the actors and actresses of these opera troupes. As for the performing art troupes of the big and medium-cities themselves, there is also a problem of raising standards. It is of great use for laying a foundation for portraying and performing well the life of the peasants and raising vocational work to go to the countryside and mountainous areas to perform for the peasants, to learn from the peasants and society, to acquaint oneself with the new look of the countryside and to substantiate one's own ideological cultivation. In short, doing a proper job in the work of vocational performing art troupes in the countryside and mountainous areas is both a must in upholding the party's literary and art orientation, doing well the work of popularization and the raising of standards and meeting the growing needs of the peasants and an important measures to raise one's own ideological quality and the quality of art. This kills many birds with one stone. We must have an adequate understanding of this matter.

The practice over the past few years has proved that doing well and developing the rural cultural and art undertakings require vigorous support from all trades and professions, and the key to this work lies in whether the local party committees attach great importance to it or not. Wherever the party committees attach great importance to rural cultural work, cultural and art undertakings spread, develop and improve at a fast rate. Therefore, future rural cultural work depends mainly on local party committees. Here I would like to stress that in times of difficulties, instead of remaining inactive to wait for something to happen and grumbling, our rural cultural and art workers must try their best to win the concern and support of the local party committees and do their utmost to overcome difficulties and do their work satisfactorily of their own accord as the vanguard fighters and model workers who are active on the rural cultural and artistic front have done. We fervently expect that the vast numbers of writers and artists and literary and art departments will make new contributions to the building of a rural socialist spiritual civilization and of cultural and art undertakings that will serve 800 million peasants with new practical actions in the new year.

PERSIST IN STUDYING MODERN CHINESE HISTORY UNDER THE GUIDANCE OF MARXISM-LENINISM-MAO ZEDONG THOUGHT--COMMENTS ON 'FROM THE OPIUM WAR TO THE MAY FOURTH MOVEMENT'

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 18, 27-29

[Book review by Qi Longwei [4362 7893 1218]]

[Text] Comrade Hu Sheng's monograph "From the Opium War to the May Fourth Movement" has been published by the People's Publishing House. This work is an achievement of an author who persisted in studying the history of modern China under the guidance of Marxism-Leninism-Mao Zedong Thought. I really benefited from reading this book.

In old China, there were almost no works on the history of modern China written from the viewpoint of Marxism-Leninism. At that time, I read many books on modern Chinese history which covered the period since the Opium War. These books can be classified into two groups on the basis of content: The first group consists of "histories in which the strong preyed on the weak" written by apologists for imperialism. The second group includes "histories of internal disturbances and foreign aggression" written by landlord and bourgeois literati. In going all-out to vilify and attack the Taiping Rebellion, the reform movement of 1898, the Yihetuan Movement, the Revolution of 1911, ... These writers aimed at opposing the people's great revolution led by the CCP. Landlord and bourgeois literati always oppose studying history from the viewpoint of class and class struggle. For example, the old specialist Jian Youwen, who had studied the history of the Taiping Rebellion for over 50 years, flatly denied that there were classes and class struggles in the modern China and simply negated the nature of the Taiping Rebellion as an antifeudalist agrarian revolution. Fallacies like this always divorce the reader from the truth of history and make him feel as if he is lost in a thick fog.

While leading the Chinese revolution to win the great victory of liberating hundreds of millions of people, Marxism-Leninism-Mao Zedong Thought also put historical studies on the right track. In seeking the laws of the Chinese revolution, Comrade Mao Zedong made use of historical materialism to draw a series of scientific inferences in the light of the actual situation in China. This forced people to reinterpret Chinese history, which stretches back several millennia, especially the history of the last 100 years since the Opium War.

Comrade Mao Zedong said, "We are historical materialists who oppose historical idealism." ("Selected Works of Mao Zedong," vol 4, p 1452) The basic principles of historical materialism are the class analysis of class society and the analysis of problems from the viewpoint of class struggle. The Chinese communists headed by Comrade Mao Zedong found two major contradictions in modern Chinese society: the contradiction between imperialism and the Chinese nation and the contradiction between feudalism and the broad masses of people, the former being the most important. It is against the background of these two contradictions that the anti-imperialist and antifeudalist revolution of the Chinese people was sparked and developed. Just as Comrade Mao Zedong put it, "The process by which imperialism, together with Chinese feudalism, turned China into a semicolony and then a colony can also be regarded in another way as the process by which the Chinese people resisted imperialism and its running dogs." ("Selected Works of Mao Zedong," vol 2, p 595)

Only by upholding the viewpoint of class struggle in interpreting the history of the last 100 years since the Opium War can we expound scientifically the objective laws governing the historical development of modern China and thus teach the people and serve proletarian politics. Comrade Hu Sheng has made great contributions in this aspect.

In the early 1950's, the People's Publishing House published "Imperialism and Chinese Politics" by Comrade Hu Sheng. In this book, he focused on the most important contradiction in modern Chinese society, linked it to extremely complicated historical phenomena and thus thoroughly revealed the fact that imperialism was the number one enemy of the Chinese people.

Soon after that, Comrade Hu Sheng published his article "On the Problem Concerning the Division of Modern Chinese History Into Periods" in the first issue of HISTORICAL STUDIES. In this article, inspired by the trend of anti-imperialist and antifeudalist struggle of the Chinese people, the author put forth the original concept of three revolutionary high tides reflecting the progressive historical trends of modern China.

On this basis, Comrade Hu Sheng gradually accumulated the results of his research on modern Chinese history and finally managed to write the book "From the Opium War to the May Fourth Movement."

Apart from the "preamble," the book is divided into five parts in accordance with the concept of three revolutionary high tides: part 1--"The Opium War and the Taiping Agrarian Revolution," covering the two opium wars and the Taiping agrarian movement and reflecting the rise and fall of the first revolutionary high tide; part 2--"The Shaping of the Semicolonial and Semifeudalist Ruling Order," covering the period from the defeat of the Taiping Rebellion in 1864 to the end of the Sino-Japanese War of 1894-1895, and during which a new high tide of the Chinese revolution was developing;

part 3--The Reform Movement of 1898 and the Yihetuan Movement," which reflects the rise and fall of the second revolutionary high tide; part 4--"The Revolution of 1911 Led by the Bourgeoisie," which reflects the third revolutionary high tide; and part 5--"The Transition to the New Democratic Revolution," which marks the turning from darkness to light.

There is no doubt that historical science research in our country has made unprecedented progress under the guidance of Marxism-Leninism-Mao Zedong Thought since the smashing of the "gang of four," in particular since the 3d Plenary Session of the 11th CCP Central Committee. The publication of Comrade Hu Sheng's new works is significant proof of this. However, owing to the pernicious influence of the "use of innuendo in writing about history" by the Lin Biao and Jiang Qing counterrevolutionary cliques and the infiltration of foreign bourgeois thinking, the authors of some articles published in newspapers and journals in the last few years have deviated from Marxism-Leninism-Mao Zedong Thought and have thrown away the method of class analysis in interpreting modern Chinese history. Under these circumstances, the publication of Comrade Hu Sheng's new work is greatly needed. Back in 1951, when discussing the film "The Life of Lu Xun," Comrade Mao Zedong did criticize some writers for "not bothering to find out what new economic formations of society, new class forces, new personalities and ideas had emerged in China during the century and more since the Opium War of 1840 in the struggle against the old economic formations and their superstructures (politics, culture, and so on), before they decided what to commend and praise, what not to, and what to oppose." ("Selected Works of Mao Zedong," vol 5, p 47) Comrade Mao Zedong called for upholding class analysis in making this serious criticism, and this is the right method and principle for the study of the history of class society, including the study of modern Chinese history. This method and principle were illustrated throughout the works of Comrade Hu Sheng, where the most prominent part is his important insight into the problem of the key to modern Chinese history.

Who represented the progressive trend in modern Chinese history? A number of arguments have been advanced in the historiographical circle in recent years. One of the schools upholds class struggle as the key and advocates that modern Chinese history was characterized by agrarian wars, bourgeois movements (including reforms and revolutions) and proletarian revolution. The other school upholds the abstract hypothesis of the "movement to learn from the West" as the key, and puts forth the new concept of "Westernization-reform-revolution." According to the logic of the latter, agrarian wars such as the Taiping Rebellion, the Yihetuan Movement and so on should be excluded from the main trend of modern Chinese history and be replaced with the Westernization movement which was promoted by the feudal rulers. Comrade Hu Sheng stuck to his clear-cut stand in opposing such logic. In the preamble of "From the Opium War to the May Fourth Movement," he solemnly declared, "The author of this book does not think that there is any reason to depict the progressive historical trend in this period in the light of the trend of 'Westernization movement--reform movement of 1898--revolution of 1911.'" I wholeheartedly agree with Comrade Hu Sheng on this point and realize that his opinion conforms with Mao Zedong Thought and the viewpoint of class struggle.

It is necessary to make a class analysis of the hypothesis of the "movement to learn from the West." In the course of modern Chinese history, the peasant class, the bourgeois reformers and the bourgeois revolutionaries all learned from the West. As pointed out by Comrade Mao Zedong, "Since the defeat of the Opium War of 1840, progressive Chinese underwent innumerable hardships in seeking the truth from Western countries. Hong Xiuquan, Kang Youwei, Yan Fu and Sun Yat-sen were the representatives of those personages who sought the truth in the West's experiences before the founding of the CCP." ("Selected Works of Mao Zedong," vol 4, p 1406) The four historical personages mentioned here were precisely the representatives of the Chinese peasant class and the national bourgeoisie (including reformers and revolutionaries) during the period of the democratic revolution of the old type. Leading the progressive trend in history, they "learned from the West" in order to save China. Why did not Comrade Mao Zedong classify the representatives of the feudal nobility, warlords and bureaucrats such as Yixin, Li Hongzhang, Zhang Zhidong and so on, who promoted "Westernization," in the same group? The reason is that these people did not follow the progressive trend of history but went against it.

The focus of the problem is that we must use the viewpoint of class struggle to assess the Westernization group and the Westernization movement. We should not compare the present to the past and thus "prettify" the Westernization group and the Westernization movement, under the pretext that our country is now importing technologies and equipment from foreign countries to promote the "four modernizations." The Westernization movement occurred after the Second Opium War ended. To assist the Qing government in "exterminating the Taiping and Nian rebels,"the foreign imperialist invaders tried by every means to arm the Qing army with "foreign rifles" and "foreign cannons." The Hunan army and the Anhui army fighting against the Taiping army in Jiangsu and Zhejiang used weapons supplied by Britain and France; the "Eight Banners Army" guarding the Beijing and Tianjin region used weapons given by Russia. The people in authority in the feudal ruling class then began to split into two groups: the diehard group persisted in "closing the country to international intercourse," while the Westernization group called for "self-strengthening by learning foreign ways." The latter group met the needs of the invasion of foreign capitalists better than the former group. As pointed out by Comrade Hu Sheng in chapter 10 of the new book, "The Westernization group emerged under the historical conditions of the feudal landlord class turning into a pillar supporting the rule of imperialism in China." How should we respond to imperialist aggression? The Westernization group flaunted their tactics of "pitting the foreigners against each other." However, as pointed out by Comrade Hu Sheng in chapter 14 of the new book, "The so-called tactic of 'pitting the foreigners against each other' was by no means a tactic in which the country made use of the contradictions between the imperialist powers independently and on its own initiative, but rather a practice of trusting the country's survival to the contradictions between the imperialist powers." The tactic of "pitting the foreigners against each other" was in essence a kind of capitulationism. The Westernization group promoted first the "training of army" and then the "manufacture of armaments." Their efforts not only gave birth to a number of armies armed with new-type weapons, but also brought about the establishment of a small number of industrial branches which used foreign machines for production. However, we cannot claim that these developments were new in modern China although none of them had ever been seen in feudal China. We cannot label one of the two belligerent parties in a war as a rising force and the other as a decaying force solely on the basis of the state of their armaments. Can we say that the Westernization group, which was showing off its "foreign rifles" and "foreign cannons" and controlling the modern war industry was new, while denouncing as old the peasant armies, which were resisting invasion and fighting against feudalism with long spears and broadswords? There is no doubt that the Westernization group borrowed a few "new things" from foreign countries. However, just like the diehards, the Westernization group was in fact a decaying force in a certain society and was not qualified to represent the progressive trend in history, as they made use of all those "new things" to oppose the people's revolution.

During the period of the Revolution of 1911, Sun Yat-sen, the great revolutionary forerunner of China, named himself "Hong Xiuquan number two" and publicly declared that he was carrying on and developing the cause of the Taiping Rebellion; while his antagonist, Yuan Shikai publicly proclaimed himself the successor to Zeng Guofan and Li Hongzhang. Such a vivid contrast reveals very profoundly the existence of two historical trends of different natures in modern China; one of them was Red while the other was Black. Therefore, the elements of the so-called "Westernization movement-reform movement of 1898-Revolution of 1911" can never be linked.

The academic argument on the trend of modern Chinese history reflects a difference in methodology. Should we uphold class analysis or replace it with abstract analogy? This question deserves a thorough discussion.

Comrade Hu Sheng's new work is a splendid extract of the rich collection of historical materials in which he gives full play to the scientific style of "interpretation based on facts." For example, owing to the lack of material sources, there has long been a difference of opinion on the issue of whether Wei Changhui killed Yang Xiuqing under the "secret edict" sent by Hong Xiuquan. Some writers who did not want people to criticize Hong Xiuquan emphasized that the "secret edict" was an out-and-out fabrication. On the other hand, some comrades at the other extreme affirmed the veracity of the "secret edict" so as to bolster the claim that Hong Xiuquan was responsible. In the light of the historical materials which have been found so far, Comrade Hu Sheng honestly narrates the course of the "internal strife between Yang Xiuqing and Wei Changhui" without making any subjective judgment. In chapter 5 of the new book, he writes, "Some sources said that he was instructed by Hong Xiuquan to kill Yang Xiuqing. This is probably true. As for the issue of whether he did make use and in what way he made use of Hong Xiuquan's name in magnifying the murder of Yang Xiuqing into a large-scale massacre, there is no proof at all." What a serious attitude this is: In the eyes of Comrade Hu Sheng, we can only correctly sum up historical experiences and make them serve the construction of socialist modernization today as long as we strictly adhere to historical materials and respect facts. In the foreword of the sixth edition of "Imperialism and Chinese Politics," he wrote, "Only by completely liberating itself from the rule and oppression of imperialism and thoroughly overthrowing the Chinese reactionary classes which were the tools of imperialism could China genuinely achieve unity of the country, democracy for the people and prosperity of the country's economy. Imperialists would never give up their goal of destroying by every means the revolutionary cause of the Chinese people. The national independence of China could never be achieved under the leadership of the bourgeoisie but only under the leadership of the proletariat. In order to make all these matters clear to readers, the author of the book does not need to distort the truth of historical facts. On the contrary, the deeper he goes into the essential and regular aspect of historical facts, the more clearly he can expound on history." This is really a splendid exposition, and his new book "From the Opium War to the May Fourth Movement" is based on such a scientific spirit.

By his own practice, Comrade Hu Sheng shows us that historical materials can never take the place of historiography; historical materials must undergo class analysis. However, historiographic practices must be based on a rich collection of historical materials and must be adhered to so as to achieve an integration of historical materials and historical interpretation. Historical interpretations made on the basis of historical analogy and under the guidance of pragmatism are always groundless.

Comrade Hu Sheng's book is written in a vivid and compendious style. For example, he reveals the traitorous nature of the Westernization group's diplomatic policy of "pitting foreigners against each other," using the Chinese idiom "inviting wolves into the house." Under the the title "The Old Viceroys Under the New Cloak of Commanders-in-Chiefs," he profoundly exposes the true colors of some reactionary bureaucrats who, in order to preserve their own strength, used the revolution for their own ends during the stormy period of 1911. He also uses the saying "prohibiting others from participating in revolution" from "The True Story of An Q" by Lu Xun to sharply denounce the criminal deeds of those bureaucrats who pretended to be revolutionary and those warlords who put down the people's uprisings. The theories of Marxism-Leninism-Mao Zedong Thought are integrated with abundant historical materials and presented in a fluent and vivid writing style--this is the distinguishing feature of the new book by Comrade Hu Sheng.

Of course the book does have some defects. A more profound elaboration is necessary on certain theoretical problems; and there are some inaccuracies in the verification of certain historical facts. We suggest that the author revise all these points before the book is reprinted.

The number of printings of this book's first edition was too small and supply fell short of demand. However, books such as the "Detective Stories of Sherlock Holmes" and so on are flooding the market! We hope that our publishing units will make an adjustment.

LAY A GOOD FOUNDATION FOR THEORETICAL STUDY BY CADRES

Beijing RED FLAG in Chinese No 2, 16 Jan 82 p 30

[Article in "Comment and Study" column by Li Xu [7812 2485]]

[Text] In a cadre's theoretical study, it is necessary to emphasize the laying of a good foundation in the theory of Marxism.

Marxism comprises philosophy, political economics and scientific socialism. These are interrelated and embody each other. These three components make up the complete scientific system of Marxism and equip the proletariat and the revolutionary masses with an ideological weapon and a guide for action in the course of understanding the world situation, transforming the world and accomplishing the great goals of communism. Mao Zedong Thought is the application and development of Marxism in China. Its main content and lively spirit have already been expounded on in the resolution of the 6th Plenary Session of the 11th CCP Central Committee. Laying a good foundation means primarily mastering the fundamental knowledge of Marxism-Leninism-Mao Zedong Thought and understanding the fundamental principles. A further requirement is mastering the Marxist stand, views and approaches which run through the principles, enabling them to become our own guiding ideology and the criteria for judging our words and deeds. The fundamental task of our cadres at all levels is to popularize Marxism-Leninism-Mao Zedong Thought among the masses, organize and arm the masses with Marxism-Leninism-Mao Zedong Thought, and lead the masses in implementing the party's line, principles and policies and in realizing the targets of struggle put forth by the party. Therefore, whether a good theoretical foundation has been laid is of primary significance for whether a cadre can do a good job in his practical work and fulfill all his obligations.

Some people might think that this is a "platitude" and may even object to it. However, reality has proved once again that without a theoretical foundation, or without a firm one, people will waver, be led astray or even make mistakes. For instance, some people treat emancipating the mind and upholding the four basic principles as two contradictory things. To them, emancipating the mind means discarding the "four uphold's" and promoting bourgeois liberalization. On the other hand, some think that advocating the "four uphold's" means advocating a rigid way of thinking and negating the need to emancipate the mind. Some people tend to neglect centralism when they stress democracy; some neglect discipline when they stress freedom; some neglect ideological and political work when they stress material interests, or vice versa. In summing up historical experiences, people either affirm or negate everything. As far as the question of ideology is concerned, it seems that opposing all "left" things and not doing things in simplified and rude ways means being weak and lax and abandoning leadership, and so on. All these are, in fact, closely related with a shaky theoretical foundation. As some comrades say: "When people cannot tell what is right or wrong in theory, they are bound to waver, politically, and they will act blindly." Only by working hard to lay a good foundation and actually improve one's Marxist theoretical level can we overcome such wavering, one-sidedness and blindness and avoid making "left" or right mistakes.

Economic construction is now the focus of all our work. Whether there is a Marxist economic theoretical foundation is closely related to whether we can do a good job in economic work. In the past, we did not attach importance to research on the Marxist theory of reproduction or research on the laws governing a socialist economy. As a result, we could not avoid making those mistakes which could have been avoided. Now, there is still a number of cadres playing leading roles in economic construction who lack the basic knowledge of economic theory. It is undeniable that this is a major factor accounting for the backward situation, low productivity and poor economic results in certain units.

In order to lay a good foundation, it is essential to conscientiously study some basic works on Marxism-Leninism-Mao Zedong Thought, to uphold the principle of integrating theory with practice, and to integrate the study of theory and summing up of experiences with the transformation of our world outlook. Many of our comrades adhere to all these things in their actual practice. However, owing to the long-term sabotage of Lin Biao and the "gang of four," the sinister trend of paying no attention to theoretical study or to transforming their world outlook still exists among some comrades. It is for this reason that their words and deeds are always different or even deviate from the Marxist stand, views and approaches. Such a situation does not accord with the obligation of each cadre or the demands of socialist construction, and we must strive to overcome it.

AN IMPORTANT DOCUMENT GUIDING THE RESTRUCTURING OF THE ECONOMIC SYSTEM--STUDYING COMRADE CHEN YUN'S 'NEW PROBLEMS AFTER THE BASIC COMPLETION OF SOCIALIST TRANSFORMATION'

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 31-34

[Article by You Lin [2589 2651]]

[Text] Since the 3d Plenary Session of the 11th CCP Central Committee, with economic readjustment as the core, we have undertaken local and experimental reforms on the system of economic management, and have made remarkable achievements. Now, our task in this regard, just as Comrade Zhao Ziyang pointed out in his government work report, lies in summing up the reform experiences of the previous period, undertaking thorough and careful investigations and studies, and conducting repeated scientific discussions and demonstrations in order to formulate in the shortest time possible an overall plan for reforming the economic management system and to gradually implement such a plan. Under such circumstances, it is especially heartwarming when we read once again Comrade Chen Yun's talk "New Problems After the Basic Completion of Socialist Transformation" at the Eighth National Congress of the Communist Party of China.

Since this talk of Comrade Chen Yun's was given 20-odd years ago, the actual situation has undergone great changes. However, the problems pointed out in his talk still exist, the measures conceived are still applicable, the basic perceptions regarding economic management are still of realistic significance. For these reasons, this talk should be regarded as an important document for guilding the restructuring of our economic management system and be very well studied.

In his talk, Comrade Chen Yun affirmed the great achievements of the socialist transformation, analyzed the problems that had emerged, elaborated the measures that should be taken, and in particular he presented the basic perception regarding the would-be conditions of the socialist economy of our country at the present stage. He said: "The conditions of our socialist economy will be as follows: in industrial and commercial management, the state and collective operations will comprise the main part, but with a certain amount of individual operations. Such individual operations are a supplement to the state and collective operations. Regarding production planning, the majority of the industrial and agricultural products of the whole country will be produced according to plans. In the meantime, however, a part of the products will be produced freely according to the variations of the market and within the scope permitted by the state plans. Planned production will be the main part of industrial and agricultural production, while the free production dictated by market variations and permitted by the state will be a supplement to the planned production. For this reason, the market of our country will never be the free market of capitalism, but a unified market of socialism. In the unified market of socialism, the state market comprises the main part, supplemented by a free market of certain scope under the guidance of the state. Being under the guidance of the state and a supplement to the state market, such a free market is a component of the socialist unified market." In the following, I would like to present my understanding of three aspects of the above passage of high generality with reference to Comrade Chen Yun's whole article as well as other articles.

Here, first of all, Comrade Chen Yun very clearly points out that at the present stage in our country the basic form of social economy comprises the socialist state economy and the collective economy with a certain amount of individual economic entities participating in labor as a necessary supplement to the socialist public ownership system. In a socialist country like ours, the state economy must predominate. Otherwise, economic life will be thrown into confusion and the overall interests of the state will not be ensured. However, it is impossible and unnecessary for the state to take charge of all enterprises regardless of their size, whether large, medium, or small, and to take charge of all their products regardless of their importance, whether primary products or secondary products. If the state takes charge of all such things while barely having the strength to do so, very unfavorable consequences will follow, as shown by facts of the past. The conditions of the relations of production depend upon the conditions of the productive forces. The large enterprises represent socialized large production. As determined by their very nature, they need to be possessed and controlled by the whole society and should be, or rather must be, operated by the state, the representative of the society. As to the small enterprises and a part of the medium-sized enterprises which basically employ manual labor and have a low level of mechanization, they are suitable for collective operation and some are only suitable for individual operation. However, we did not make such distinctions in the past. In the latter stage of the three great transformations mistakes appeared in demands being too urgent, crude and careless work, excessive speed of change, oversimplification and unification of forms, and so on. The above generalization made by Comrade Chen Yun was directed at such situations. Then, we persisted in "promotions" and "transitions" and hastily "promoted" the handicraft cooperatives to state factories and the cooperative stores to state stores. Even the newly established collective ownership enterprises were also "promoted" without a moment's thought. This "promoted" the genuine collective ownership enterprises owned and run by the broad masses of the people to enterprises belonging to the neighborhoods, districts, and municipalities, or in other words, to enterprises of "collective" ownership possessed and controlled by various levels of local governments. With such a situation, the state economy became almost the sole economic form in the cities. Consequently, this was very unfavorable to mobilizing the enthusiasm of all concerned, causing the decrease in varieties of products and the down-grading of quality and causing the diverse and ever-changing demands of the consumers to fail to be better satisfied.

As indicated by the conclusion of historical experience and the analysis of the actual situation of our country, in the cities it is not only necessary to work hard to develop the collective ownership economy of the laboring masses and the individual economy of the working people in a proper way, but also to carry out the necessary reform of state enterprises. The small enterprises as well as part of the medium-sized enterprises that produce general products should be allowed to operate on the basis of responsibility for their own profits and losses. The important departments such as banking, railway transportation, civil aviation, posts and telecommunication, and so on, should be operated by the state. The same is true of the large enterprises as well as a part of the medium-sized enterprises in such fields as the iron and steel industry, nonferrous metal industry, the fuel industry, electricity generation, machine building industry, chemical engineering, construction materials, textiles, and light industry, as well as other industries. Only by commanding these departments and industries can the state control the economic lifeline and play its leading role over the diversified economic forms. The owner of this category of enterprises should be the entire working people, and the workers of these enterprises are only a part of the entire working people. Since the managers of these enterprises run these organizations in the capacity of representatives of the state, the enterprises must produce and operate in conformity with the plans of the state, and profits must be handed over to the state as stipulated. Of course, in order to encourage the enthusiasm of the enterprises the state should also give the enterprises certain authority and profits. However, they cannot produce and operate independently, nor be responsible for their own profits and losses, as are the small enterprises and a part of the medium-sized enterprises mentioned above.

Next, Comrade Chen Yun pointed out that planned production should constitute the main part of industrial and agricultural production and be supplemented at the same time by free production as dictated by variations of the market and permitted by the state plans. It is upon the foundation of public ownership that we must bring about our planned economy and give play at the same time to the supplementary function of regulation by market mechanism. The planned economy, the national economy run consciously in accordance with present plans, is closely related to the system of public ownership. It comes into being with the system of public ownership as its foundation and shows an important side of the economic essence of socialism. It is undeniable that the socialist economy must be developed in a planned way. However, the scope and extent of planning depends upon the degree of public ownership. With the present level of productive force in our country, we are far from the completion of the socialization of the entire means of production, as a commodity production still exists, making it impossible to include the entire social production in a single unified plan and to carry on production and operation entirely according to plans without regulation by the market mechanism. The following procedure is more in line with the actual situation: first, the important economic departments, the large enterprises and a part of the medium-sized enterprises should be owned by the state. It is these enterprises which produce and operate according to the unified plan of the state. As these departments and enterprises predominate in the national economy with their production and operation carried on according to plans and coupled with the unified purchasing and assigned purchasing of farm produce which in practice constitute production by plans, planned production is ensured as the main part of our industrial and agricultural production. Second, the other category of enterprises (the collective ownership enterprises and state enterprises with responsibility for their own profits and losses) should produce and operate freely according to the fluctuations of the market and within the scope permitted by the plans. Should these enterprises be guided by the state plans? Very much so. In addition to such measures as taxation, credit, pricing, and so on, reference targets can also be passed down. All these measures are used to channel the production and operation of these enterprises as much as possible into the state plan and to subject the regulation by market mechanism to the guidance of state planning. The trouble with our planned management system is that everything is listed in the plans and everything is controlled by plans. As a result, the economy becomes very rigid. In brief, what should have been put under strict planning has not been so planned and controlled, whereas what should not have been included in the plan was. Comrade Chen Yun has always been opposed to such practices. In his article, he pointed out that products such as consumer goods for everyday use, handicraft products, small local products and so on, with only very few exceptions, should not be included in state plans. The requirements of the state plans regarding the output value of these products, the reduction of costs of the consumer goods for everyday use, and the enhancement of labor productivity, as well as other requirements, are only taken as reference targets. The producers are allowed to fix their own targets in relation to the market conditions to carry on their production without being committed to the reference targets. These measures, as viewed, are basically applicable.

Recently, when speaking of the relationship between planned economy and regulation by market mechanism in his report on government work, Comrade Zhao Ziyang quoted the following words of Comrade Chen Yun's in his article under discussion: "Planned production will be the main part of industrial and agricultural production, while the free production dictated by market fluctuations and permitted by the state plans will be a supplement to planned production." Comrade Zhao Ziyang also pointed out: "This idea of Comrade Chen Yun's is still of realistic and guiding significance to our present reform." Comrade Zhao Ziyang also said: "We envisage that different management methods should be applied to different groups of enterprises in terms of the different positions they occupy in the national economy, in their ownership system, the importance and categories of their products, and the varieties of their specifications. Generally speaking, there are four categories. To the first category belong those enterprises which produce according to the directives of the state plan. These are the backbone enterprises which command the economic lifeline of the country and produce the main products for the national economy and the people's livelihood, and their output value accounts for the majority of the total output value of industry and agriculture despite the fact that the varieties of their products are not numerous. Under the second category are the products which are produced according to the fluctuations of the market and within the scope permitted by the state plan. These are the small commodities of many different varieties, scattered among and produced by numerous small enterprises and individual workers. It is impossible and inconvenient to subject them to unified planning and management. They only account for a small part of the total output value of industry and agriculture. Between these two major categories, there are two more categories of enterprises and products. One category produces most of its products according to the state plan and leaves the minority of its products to small enterprises which have a free hand in organizing their production. This category is basically similar to the first major category, though not without dissimilarities. Another category leaves most of its products to enterprises which organize their production according to the fluctuations of the market, and the minority of its products to the planned production of the state. This category is basically similar to the second major category, also with certain dissimilarities. A management like this differs not only from the one we had, which was far too rigid, but also from the market economy of the capitalist countries. It combines the centralized and unified leadership of the state and the enthusiasm of the enterprises, and ensures the result of control with flexibility, flexibility free of disorder, greater economic benefits, and organization and development of production in accordance with the needs of society." This is a very important step with crucial significance to the reform of the management system.

Lastly, Comrade Chen Yun also pointed out that the state market must comprise the main part of the socialist unified market, and be supplemented by the free market under the guidance of the state in stipulated terms. The main part of our industrial and agricultural production is planned production. Similarly, the main part of our commodity circulation must also be planned circulation. The important departments and the backbone enterprises must be run by the state. The backbone enterprises of commerce and large stores also must be run by the state. The state market is operated according to plans. In fact, many products such as grain, cloth, and so on, are distributed through the market according to plans. However, the state market can only be the main part, but never the whole. This is to say, aside from the state market, there must also be a free market. Without such a market, the production and development of industry and agriculture will be unfavorably affected and the people will be inconvenienced.

However, very frequently we failed to give such all-round considerations to our problems in the past, always thinking that the more unitary our ownership system the better, and the less the circulation channels the better. As a result, both the unitary aspect of our ownership system and the paucity of circulation channels have been achieved only to be accompanied by the monotony of the market and the economic life of the people. Actually, such troubles were burgeoning when the three great transformations were basically completed. The measures that were adopted to restrict capitalist industry and commerce and proved to be unnecessary after the completion of the three great transformations, as mentioned by Comrade Chen Yun in his article, all had a bearing on this problem. All those measures needed transformation, and they did undergo alteration at the suggestion of Comrade Chen Yun. However, under the subsequent influence of the "leftist" guiding principle, no problem was really solved and instead problems piled up to give rise gradually to the situation in which planned production and distribution ruled with regulation by market mechanism reduced to nil and with the commercial sector accepting whatever the industrial sector produced, not only in regard to the kind of products but also their quantity. During the readjustment period from 1961 to 1963, things were slackened to a certain extent, the rural fairs were revived, the commodity circulation under the unified leadership of state commerce and with the coexistence of state commerce, cooperative commerce, and rural fair trade was approved, and some municipalities allowed free purchasing of handicraft articles. However, the transformation did not persist. As the "Great Cultural Revolution" came along, even worse rigidity ruled.

While pointing out the existing problems, Comrade Chen Yun presented his measures to overcome them. One measure was to replace the processing orders placed by the commercial sector on the factories by letting the factories purchase the materials and sell the products themselves. Another measure was to replace the monopolistic unified purchase of a part of the unimportant agricultural and sideline products such as small local products by the supply and marketing cooperatives with free purchasing and free selling by the state stores, cooperative stores, cooperative teams, and the supply and marketing cooperatives. If a shortage of supply should occur due to competitive purchasing, the supply of the goods should be allocated under the guidance of the local government according to the order of urgency in regard to the needs of the various units. Still another measure was to implement price policies that stimulated production, which included pricing by quality, free purchasing, free fluctuation of prices of small local products which were allowed to be peddled freely, and so on. We should carefully study the measures presented by Comrade Chen Yun to provide solutions for the problems that existed, and then substantiate and develop them in the light of the new situation in order to ensure the practical and reliable implementation of the principle that the state market should comprise the main part and be supplemented by the free market.

To sum up, in his article, Comrade Chen Yun has laid the fundamental basis for the reform of our economic system in respect of ownership structure, production management and circulation management. We should put his concepts into a concrete form in the light of the specific situation at present, and plan our reforms in the several aspects of planning and the management systems of finance, taxation, prices, banking, commerce and wages.

QUESTION: IN OUR PRESENT EFFORTS TO IMPLEMENT THE ECONOMIC RESPONSIBILITY SYSTEM, WE EMPHASIZE INTEGRATING RESPONSIBILITY, POWER AND INTERESTS; HOW DOES THIS RELATE TO INTEGRATING THE THREE INTERESTS OF THE STATE, THE COLLECTIVE AND THE INDIVIDUAL OF WHICH WE USUALLY SPEAK?

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 34-35

[Article in "Questions and Answers" column by Li Guangyuan [2621 0342 6678]]

[Text] Answer: The integration of the interests of the state, the collective and the individual worker is the basic principle in accordance with which the relationships of socialist economic interests are handled. The integration of responsibility, power and interests, as embodied in the socialist economic responsibility system, is a means of effecting the integration and simultaneous growth of the interests of the state, the collective and the individual worker. The integration of responsibility, power and interest must be subordinate to the requirements of the principle of the integration of the interests of the state, the collective and the individual worker. Why do we say this?

Socialist public ownership is a system whereby individual workers jointly exercise ownership. Workers are masters of the state and the collective. Therefore, the interests of the state are tantamount to the common interests of all individual workers, and also tantamount to the common interests of all workers' collectives. The interests of a collective are tantamount to the common interests of a specified group of workers. The ultimate aim of all activities of the state and the collectives is to bring about the constant growth of the interests of all individual workers. This objective relationship of interests gives rise to the principle of the integration of the interests of the state, the collective and the individual. The main substance of this principle includes the following: First, due consideration must be given to the interests of the three parties, because although the interests of the three parties coincide there are also conflicts of interests between them. Therefore, we can and we should give due consideration to their interests. Second, the individual's interests must be subordinated to those of the state and the collective. The interests of the collective must be subordinated to those of the state. This is because the common interests of a community are above and more important than the interests of any individual or any part of the whole community. The former is the basis on which the latter can be safeguarded. For example, the strengthening of the state and the development of the national economy constitute the basis on which improvement of the individual's livelihood can be ensured. Third, enhancement of the interests of the collective and the state serves the ultimate purpose of promoting and safeguarding the enhancement of the interests of all individual workers. What is "taken from the people" must ultimately be given to the people." .

Generally speaking, the integration of responsibility, power and interests is not a principle peculiar to socialist economic relationship. It is a principle universally applicable to all categories of relationships of commodity exchange, because any commodity exchange relationship is tantamount to a contract relationship. Whether contracts are written or not, this relationship always determines some sort of integration of the responsibility, power and interests of the two parties under consideration. When one party assumes responsibility for supplying commodities to the other party, it will correspondingly acquire the power to obtain a supply of commodities from the other party and will hence gain certain benefits. Various essentially different commodity exchange relationships give rise to essentially different ways of integration of responsibility, power and interests.

The integration of responsibility, power and interests in the socialist economy is radically and essentially different from the integration of responsibility, power and interests of commodity exchange relationships under private ownership. The difference is that in the exchange of commodities under private ownership, such integration is a means of safeguarding the conflicting private interests of various owners of private property; whereas in the socialist economy, such integration is a means of achieving the integration of the interests of the state, the collective and the individual workers as well as a means of safeguarding the simultaneous enhancement of these three parties' benefits. In the exchange of commodities under private ownership, the two opposing parties are owners of private property with conflicting interests. Each of them only cares about its own private gain, and supplying commodities to the other party is only a means of achieving private gain. Therefore, each party strives to give as little as possible and take as much as possible. Transactions are concluded after bargaining between the two parties because they are forced to do so by the spontaneous competition in the market. In socialist economic relations, the parties between whom conflicts exist are three parties whose interests coincide, namely, the individual worker, the worker's own collective and his own state. Each party cares about the integration of the three parties' interests, aside from its own interests. In the socialist economy, responsibility, power and interests are integrated. They are also divided between various parties in the light of the specific circumstances of the development of the socialist cause and in the light of various specific conditions of the state, the collective and the individual. Such integration and division are aimed at the simultaneous enhancement of the interests of the three parties, and are decided and carried out in a planned way. If so, then how does the integration of responsibility, power and interests serve the integration and enhancement of the interests of the state, the collective and the individual?

First, in practicing the economic responsibility system, we must specifically determine the responsibility, power and interests to be assigned to various parties and also determine the mutually restrictive relationship between responsibility, power and interests. Thus, we can have specific criteria and methods for integrating the interests of the state, the collective and the individual. With these criteria and methods, everyone will know how he can make contributions and how greater contributions will benefit both the whole community and himself. Thus, we will be able to do away with egalitarianism and "eating out of one big pot," which is characterized by confusion about what responsibilities each should shoulder, ignorance of what is right or wrong, unclear rewards and punishments, and equal pay to all regardless of the amount of work done. When these things are done away with, the enthusiasm of all parties can be mobilized so that they will all do their best to make greater contributions to the simultaneous enhancement of the interests of the three parties.

Second, when we determine the responsibility, power and interests to be assigned to various parties in practicing the economic responsibility system, we must proceed from the principle of integrating the interests of the three parties and avoiding one-sidedness. For example, why must we specify comprehensive targets for assessing the work of industrial enterprises that practice the economic responsibility system? In addition to targets for profits, why must we also require the enterprises to produce marketable products, raise product quality, reduce the consumption of resources and promote industrial safety? In practicing the reward system, why must average advanced quotas be taken as the basis? The reason is that these are required by the basic principle of the integration of the interests of the three parties. In instituting the system of responsibility in rural production, what forms should be adopted? What should be centralized? What should be decentralized? Should the basic figures in contracts be high or low? These should all be determined according to what measures will be conducive to the integration and enhancement of the interests of the three parties in various circumstances.

Lastly, we must more vigorously educate the cadres and the masses in the ideologies of patriotism and collectivism. We must both overcome the tendency of neglecting the individual interests of the masses and oppose individualism and departmental selfishness. Thus everyone can really realize the coincidence of the interests of the three parties and consider themselves to be masters of society. The majority of peasants and rural cadres not only hope for increased individual income, but also want to make the greatest possible contributions to the state and the collective. The majority of workers and cadres of enterprises wish to share the burden of the state and enhance the state's gains, and they consider the retention of profits by the enterprises and the distribution of bonuses to workers to be of less importance. This is the main trend. It is precisely this socialist ideology and collectivist spirit of the masses and the cadres that enables the practicing of the responsibility system to bring about the fine situation of continuous development in production and simultaneous enhancement of the interests of the state, the collective and the individual. However, we must also note that a minority of people still do not consider themselves to be masters. In viewing socialist economic relations, they are still accustomed to those concepts concerning responsibility, power and gains that are characteristic of commodity exchange relationship under private ownership. They only want to gain greater benefits for themselves. They disregard the overall situation of the socialist cause and even try by all means to exploit, to their own advantage, "loopholes" in the policies and systems formulated by the state. They practice fraud and violate public interests for their own private gain. In view of this, we must persist in educating people in the integration of the interests of the state, the collective and the individual. Thus, we can ensure that the responsibility system involving the integration of responsibility, power and interests develops healthily along a socialist orientation.

THEORETICAL STUDY BY CADRES IN THE EARLY 1950'S

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 36-37

[Article by Hu Qilin [5170 0120 2651]]

[Text] Under the leadership of the party, an upsurge in theoretical study by the cadres and masses emerged in the early 1950's. The upsurge in theoretical study at that time was an inevitable product of the development of the revolutionary situation; it was an important ideological preparation for the cadres and masses in fulfilling the revolutionary and construction tasks in the new period.

The Chinese revolution was won under the guidance of Marxism-Leninism-Mao Zedong Thought. Therefore, the people naturally had an urgent desire to study Marxism-Leninism-Mao Zedong Thought when they hailed the victory of the revolution. Although many comrades who had worked in the liberated areas had valuable experience in the revolutionary struggle, they were unable to carry out systematic theoretical study under the conditions of hard struggle. So they felt the need to study again when confronted with the new situation and tasks which were unfamiliar to them. In the light of specific conditions, our party did a great deal of ideological and organizational work concerning theoretical study, so that the study campaign at that time could develop healthily throughout the country and achieve remarkable results.

The theoretical study in the early 1950's began with the study of the history of the development of society--the study of historical materialism, and it lasted for several years. In the study, by closely referring to the development of the situation, they carried out the principle of combining theory with practice; energetically mastered some basic viewpoints of historical materialism such as the attitude to labor, the attitude to the masses, the class viewpoint and the Marxist theory of state; and conscientiously remolded their ideology. They initially or further understood some basic principles of Marxism. All this laid a good foundation for a profound theoretical study.

On the above basis, the study of Marxist political economics was launched in various places throughout the country, and in respect of socioeconomic relations, the cadres and masses further understood the law governing social development, especially the inevitability of socialism replacing capitalism. This had great significance for understanding the character of Chinese society, solving the problems that emerged in the construction of the new democratic economy, conscientiously implementing various economic policies of the party and forming a revolutionary outlook on life. The study of political economics was a step forward in the theoretical requirements of the cadres and masses, as well as the need to solve our practical problems. Therefore, it further stimulated the people's initiative to study. During the study of the above-mentioned subject, everyone, in accordance with their own theoretical level and by means of various organizational forms, studied Lenin's "On Imperialism," Stalin's "Problems of the Socialist Economy in the Soviet Union" and "Textbook of Political Economics" and some important documents concerning economic problems issued by the party Central Committee. In the study and discussions, they energetically combined theory with practice and achieved good results.

In 1952, the party Central Committee put forward the general line for the transitional period. In 1953, China began its first 5-year plan and entered the period of large-scale economic construction. What was the transitional period? How should we carry out industrialization and the socialist transformation of the ownership of the means of production? How should we unfold our large-scale economic construction in a planned way? The people were eager to have a correct theoretical explanation of these questions so they could suit their own work to the requirements of the new situation. Therefore, our party timely organized the study of the 9th to 12th chapters of "The History of the Communist Party of the Soviet Union (Bolshevik)" and Lenin's and Stalin's works concerning socialist economic construction, while extensively organizing the study of the general line for the transitional period. Many people who had such an experience still remember how large numbers of people energetically took part in the study.

The above-mentioned theoretical study was carried out in combination with the study of Comrade Mao Zedong's works. After the victory of the revolution, hundreds of millions of people, with energetic propagation by the party, studied Comrade Mao Zedong's works with great eagerness. Before the publication of the "Selected Works of Mao Zedong," people in various places mainly studied such basic works of Comrade Mao Zedong's as "On Practice," "On Contradictions" and "On the People's Democratic Dictatorship." From 1951 to 1953, volumes 1, 2 and 3 of "Selected Works of Mao Zedong" were published successively, and a systematic study of each volume was energetically organized. In this way Mao Zedong Thought was popularized on an unprecedented scale.

As far as organizational and leadership work was concerned, the theoretical study at that time was noted for its regularity. In the early period of the founding of the People's Republic of China, study committees and study groups (generally divided into two grades) were set up in various institutions and organizational bodies. Sufficient time was devoted to theoretical study because the cadres earnestly wanted to master basic theoretical knowledge. After 1951, the theoretical study of employed cadres began to gradually embark on the road of regularization. Part-time political schools were set up one after another in various places throughout the country; centralized unified study plans were carried out; and the regular system of roll call, asking for leave, making up missed lessons, examinations, and rewards and punishment was implemented. A strict method of grouping more employed cadres into classes was beginning to be implemented according to their educational levels and basic theoretical knowledge, instead of according to their rank or position. The cadres who took part in the study were divided into Group A, Group B and Group C (which were changed to advanced group, intermediate group and elementary group after the latter half of 1952). They had different contents and requirements for their study and implemented a system of giving regular tests and examinations and of making promotions. Various institutions, organizational bodies and units at the battalion level and above in the army were gradually provided with theoretical instructors, theoretical teachers and study advisers. Lecture groups were also formed in some regions. After the party Central Committee's instructions concerning the cadres' theoretical education from 1953 to 1954 were transmitted throughout the country, attention was further focused on the training, provision and grouping of theoretical teachers. Large numbers of Marxist-Leninist evening schools and training courses were set up to train theoretical teachers. A network of theoretical study by employed cadres was formed in some regions. In addition, high-ranking cadres in many regions who were comparatively highly self-cultivated in theory were required to independently study in a systematic way the works of Marx, Engels, Lenin, Stalin and Comrade Mao Zedong, especially works that were closely related to the work in their own departments. They were to write study theses and reports, regularly help common cadres with their study and explain to them the questions they might come across during their study. Because the study system was regularized, the cadres' theoretical study was further carried out under unified leadership, in a planned way and with checkups. This was an important reason why the study campaign at that time could last so long and achieve such good results.

Another characteristic was that party organizations at all levels paid extensive attention to giving guidance with specific aims. Party organizations at all levels placed the cadres' theoretical education in an important position in the party's work. The Propaganda Department of the party Central Committee, the branch bureaus of the party Central Committee and party committees in various places often made a study of the situation of theoretical study, worked out study plans and issued, with specific aims, instructions for intensifying and improving the cadres' study. They also compiled teaching materials in a timely manner. The outline for the study and propaganda of the party's general line in the transitional period compiled by the Propaganda Department of the party Central Committee played an important role in pushing forward the political theory study at that time. Study rooms, research rooms and special institutions in charge of employed cadres' theoretical education were formed in many provinces.

Here I would like to mention the guidance work of the magazine XUEXI [STUDY] in the study campaign at that time. As a periodical which gave instructions concerning cadres' theoretical study and which was under the direct leadership of the Propaganda Department of the party Central Committee, this magazine was extensively welcomed by the cadres and masses for its guidance on specific aims. Its main role was as follows:

1. In the light of the study content and the people's actual ideological condition, it repeatedly explained the necessity for all cadres to study Marxism-Leninism-Mao Zedong Thought while familiarizing themselves with their own professional work. It used various forms (such as commentaries and study comments) to energetically propagate various important instructions issued by the party with regard to theoretical study and to guide the localities in implementing the instructions. It actively propagated the important significance of various study contents. It particularly emphasized that the study had to focus on the actual problems of the revolution and construction in China, and took Marxism-Leninism-Mao Zedong Thought as the guiding principle. It issued large numbers of articles with regard to the major problems in various courses and with regard to the theoretical problems the cadres were concerned about in order to make it convenient for everyone to study, refer to and discuss them.

2. It provided teaching and reference materials. For instance, for the study of the history of social development, the magazine XUEXI gave wide coverage to the "forum on the basic knowledge of social sciences." For the study of chapters 9 through 12 of the "History of the Communist Party of the Soviet Union (Bolshevik)," it not only provided the study reference outline for the intermediate group, but also provided systematic reference materials for reading. In order to help the elementary group, staff and workers, and young students to study basic knowledge concerning social sciences and economic construction, the magazine publishing house, from 1951 onward, edited and published the elementary edition of XUEXI, the "Book of Political Knowledge" and "Book of Knowledge for Economic Construction." It also provided the study outline, answers to questions, explanations of terms and phrases and the relevant materials for each chapter in each book.

3. It energetically did a good job in answering questions. XUEXI attached great importance to this work. The magazine regarded this not only as its basic responsibility for helping the cadres with their theoretical study, but also as an important method for understanding the situation and improving its editorial work. Letters kept coming in from readers expressing their questions answered. This fully reflected their study and the need for study. XUEXI had a group specially responsible for answering the readers' questions sent to the magazine. It seriously handled all questions put forward by the readers and answered them after careful consideration. Some answers were given individually, some were carried in the "Questions and Answers" column of the magazine. This was well received by the readers.

There were various shortcomings in the cadres' theoretical study at that time, but on the whole the success was remarkable. The theoretical study enabled the cadres and masses to receive a profound education on Marxism-Leninism-Mao Zedong Thought, and trained a group of cadres who had a firm theoretical basis, who had formed a proletarian world outlook and who had lofty ideals. It promoted the realization of the unprecedented change China was experiencing at that time.

The study campaign showed that great changes are the best ways to make people learn new things and study new problems. So long as we are good at arousing and promoting the consciousness of the people in their theoretical study by educating them to have lofty ideals and realistic aims, we can stimulate the people's enthusiasm for theoretical study and create an atmosphere in which the people study hard for the revolution and construction.

The study campaign showed that the study of Marxism-Leninism-Mao Zedong Thought, organized according to the development of the situation and the cadres' different conditions, is well received and can achieve the best results, and therefore it is most vigorous. In addition, giving guidance with specific aims in study is an important link in doing a good job in study.

The study campaign showed that it is of extreme importance to have the attention and firm leadership of party organizations at all levels. Without strong ideological and organizational leadership, it is not conceivable that thousands of people could take part in the study campaign profoundly, persistently and effectively.

RELY ON THE COLLECTIVE ECONOMY TO BUILD MATERIAL AND SPIRITUAL CIVILIZATION IN THE RURAL AREAS--THE SUPERIORITY OF THE SOCIALIST SYSTEM SEEN FROM THE VAST CHANGES IN NANHAI COUNTY

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 38-41

[Investigative report by Lin Hong [2651 3163], Zhou Jingying [0719 4842 5391], Wu Chifeng [0702 6375 6912] and Yang Jianrong [2799 1696 2837], workers in the Propaganda Department of the Guangdong Provincial CCP Committee]

[Text] Nanhai County is located in the northern part of the Zhujiang delta, near Guangzhou municipality. It has a population of 800,000 people. A land of fish and rice, it has 800,000 mu of farmland, including mulberry tree plantations and fish ponds. Since liberation and particularly since cooperativization, people in Nanhai County have successfully built a material and spiritual civilization by means of the strength of their collective economy. Vast changes have taken place in industrial and agricultural production, in the people's standard of living, and in their spiritual appearance and social habits.

I

The vast changes in Nanhai County are, above all, manifested in the rapid development of industrial and agricultural production. In 1980, the gross value of the county's industrial output amounted to over 473 million yuan, an increase of 11 times over that of 1949; the gross value of its agricultural output amounted to over 415 million yuan, an increase of 36 times over that of 1949; grain production increased from 250 million jin in 1949 to 780 million jin and the per mu yield increased from 492 jin to 1,500 jin, an increase of over 25 times; and production of peanuts, sugarcane, silkworms, pigs and pond fish increased respectively by 8 times, 5.9 times, 13.6 times and 3.9 times. On average, the per capita industrial and agricultural output value was 1,105 yuan (not including the household sideline income of the commune members), or $624.

What is the principal reason for the rapid increase in the industrial and agricultural production of Nanhai County?

First, the county has relied on collective strength to continuously change production conditions, to develop large-scale capital construction in farmland water conservancy, to build up large tractors of high-yield farmland which is resistant to drought and waterlogging, and to carry out basic farm mechanization to ensure a continuous high and stable yield in agricultural production.

Before liberation, water conservancy conditions in this region were in a very bad shape. Whenever a flood occurred, the river embankments would collapse and large tracts of good farmland would be inundated. In the two relatively large floods in 1947 and 1949, river embankments collapsed in a score of places and in these years respectively, 250,000 mu and 60,000 mu of ricefields were inundated. The disaster-stricken peasants had nothing to eat but chaff and wild herbs. Some of them had to leave the county to escape the famine while countless numbers died of hunger.

After liberation, the party led the peasants to take the road of cooperativization and to carry out, in a planned manner and step by step, water conservancy construction work in the farmland. First, beginning in the 1950's, a large number of river embankments were built. In all, 35 river embankments with a total length of over 400 kms were completed. This protected the largest part of the farmland from flood. In 1968, the biggest flood in history occurred in the region, but not a single river embankment collapsed. After the 1960's, an electically powered irrigation system covering the entire county was gradually completed. Nowadays, rains as heavy as 200 mm in a single day can be drained off within 3 days. In the 1970's, work was mainly concentrated on levelling land so that garden-style cultivation of the great proportion of land in the whole county could be achieved. At the same time, much progress has been made in farm mechanization. At present, the county owns nearly 4,000 tractors of various kinds and over 1,000 electric motors, in addition to a large assortment of processing machines for agricultural products and mechanical conveyances for water and land transport; 75 percent of the farmland has now been put under mechanized farming. Mechanization of the processing of farm products and of farm transport has basically been realized, as has the electrification of irrigation. The level of scientific farming has also been noticeably improved and, as a result, the labor productivity rate in agriculture has been greatly enhanced.

Obviously, if they did not rely on the powerful strength of the collective economy but relied solely on the small economy of the individual farm households, it would have been impossible within a short period of time to complete such a huge scheme of farmland water conservancy and the initial stage of agricultural mechanization.

Second, the county has brought into full play the superiority of the systems of unified management and rational division of labor under the collective economy, "firmly grasping the main structure (grain) and developing the two wings (industrial sideline occupations and the planting of rearing trades)," and continuously developing the scope and depth of production.

Nanhai County has a plentiful supply of labor power. Because of its proximity to large cities and towns, it possesses advantageous conditions for the development of industrial sideline production and the commodity economy. But it was only after the populace had been organized that this superiority was brought into full play. Following the cooperativization of agriculture, and particularly since the 3d Plenary Session of the 11th CCP Central Committee, people in the county have emancipated their minds, rationally readjusted the structure of their agricultural economy, and gradually implemented the guideline of "grasping the main structure, developing the two wings, and bringing into play the combined operations of agriculture, industry and commerce." That is to say, under the logical premise of ensuring a gradual increase in grain production, freely developing industrial sideline production and multiple operation forms. In addition to the large-scale production of agricultural sideline products, industries such as those producing chemical fertilizer, hardware, electronics articles, household electrical machines, textiles, garments, plastics, printed matter, leather goods, metallic products, machines and construction materials all started from scratch and were swiftly developed. Some of these industrial products have been marketed in other parts of the country and abroad. As a result, the whole rural economy has steadily been enlivened. The income of the communes and production brigades from the collective economy has swiftly increased while their income from industrial sideline occupations and from the planting and rearing trades, and the proportion these occupy in the collective economy gross income, have also greatly increased. In the year before last, the composition of the collective income of the county as a whole was as follows: grain, 27.9 percent; industrial sideline occupations, 39.1 percent; and the planting and rearing trades, 33 percent.

As a result of specialization and division of labor in industries run by the communes and production brigades and the growth of cultural and educational enterprises in the rural areas, a large number of peasants have become workers or personnel with specialized training. At the same time, the small cities and towns where the people's communes are located have become the political, economic and cultural centers of the rural areas. The disparity between worker and peasant and between city and countryside has gradually shrunk. Thus, the development of such social maladies as overpopulation, unemployment and a high crime rate caused by the influx of a large number of poor or bankrupt peasants into the large cities and towns, frequently seen in capitalist countries in the course of their industrialization, has been avoided. This is of deep and penetrating significance.

II

Following the rapid growth of the collective economy, the peasants have quickly become affluent. In 1980, the average per capita income of the rural commune members in Nanhai County was 341 yuan, the highest in Guangdong Province and equivalent to 4 times the national average. At present, in the countryside of Nanhai County there are three signs of plenty: plenty of savings deposits, plenty of new houses, and plenty of purchases of high-grade commodities. In the year before last, the gross amount of bank deposits of commune members in the whole county was 83.3 million yuan, averaging 128 yuan per peasant. The majority of new houses built in the countryside of Nanhai County consists of two-storied brick and tiled buildings with attached veranda. Many families of commune members have electric fans, radios, dining sets and sofas. Some have television sets, radio-recorders, steel and wooden furniture, and electric rice cookers. When talking about their present living standard, the affluent peasants are all smiles. They say that if the present policies of the party are continued for another 3 to 5 years, their standard of living will be even better.

These facts are incredible unless they are seen or heard personally. Before liberation, because of the heavy taxation levied by the reactionary government and the many natural disasters, the broad masses of peasants in Nanhai County lived under the tragic circumstances of not having enough to eat and hardly any clothing to wear. For example, what is now the Nansha production brigade of Xiaodong people's commune was so poverty-stricken that there was a common saying that "no girls want to marry into a Nansha family." But now, Nansha is greatly changed in appearance. In the year before last, the gross rice output of the whole brigade amounted to 2.25 million jin, averaging over 1 ton of grain per mu. Collective income amounted to over 5 million yuan, averaging 996 yuan per commune member. Twenty households had an income of over 10,000 yuan each. The collective accumulated funds of the brigade amounted to over 3.7 million yuan. Over recent years, this production brigade, which has some 500 households and a population of over 2,100, has built 535 new residences and bought over 1,000 wristwatches, 482 bicycles, 375 electric fans and over 70 television sets. Its members have deposits of 1.42 million yuan in the savings society. The former tragic era of "not marrying a daughter into a Nansha family" has gone and will never return.

Under the spiritual guidance of the 3d Plenary Session of the 11th CCP Central Committee, the Nanhai County party committee and the Nanhai County people's government, on the one hand, actively encouraged communes and brigades favored with better conditions to become affluent first, and, on the other hand, vigorously supported communes, brigades and teams in difficulties to quickly extricate themselves from their impoverished condition and proceed toward affluence. Over each of the last few years, the county has granted loans to impoverished teams or made investments amounting to 6 to 7 million yuan. The relevant departments accorded to these teams "seven priorities." These relate to: the supply of the means of production; arrangements for bank loans; providing facilities for mechanized farming; repairs of damaged farm machines; purchase of agricultural sideline products; absorption or employment of personnel in industrial sideline occupations; and supply of transport facilities. These measures were of immense help to the impoverished units. As of the end of the year before last, in the whole county there remained only four production brigades which had average per capita incomes of less than 150 yuan. These constituted only 1.6 percent of the total number of production brigades in the county.

III

Concurrently with the swift growth of the socialist collective economy and the noticeable improvement in the standard of living of the people, the spiritual state of the populace has also changed considerably. Proceeding arm in arm on the road to affluence, the people have gradually evolved common ideals and new moral concepts. A new type of relationship between human beings has taken shape. Following the call by the party Central Committee to help the peasants become rich as soon as possible, cadres at various levels shared the same thoughts and the same feelings of urgency as the peasants. They devised various ways and means to help the production teams enhance production. For this they were greatly welcomed by the commune members. As a result, the relations between the cadres and the masses became increasingly friendly. Between the commune members themselves, the spirit of unity, comradeship and mutual help was also greatly enhanced. Based on the continuous development of the collective economy, collective welfare work progressed steadily. Cooperative medical care was introduced into all communes and production brigades in the county. Many of the comparatively affluent communes and production brigades instituted a retirement scheme for aged commune members. Under the system, the pensions of retired members are equivalent to 50 to 70 percent of their average work points over the 3 years immediately prior to retirement. In the year before last, 83 retired members of the Nansha production brigade received, on average, a pension of 504 yuan per person. The maximum amount received was 859 yuan. In addition, there are no charged for infants attending nurseries, for children going to school (up to senior middle school) or for commune members seeking medical care. At the same time, firewood, tap water and movie shows are provided free of charge. Funerals for deceased commune members are subsidized. All these things caan be summarized as follows: nurseries for the infants, schools for the young, medical care for the sick, provision for the aged, and funeral services for the dead.

The socialist economy has brought enormous material benefits to the peasants of Nanhai County. In turn, the peasants have closely tied their destiny to the socialist enterprises and to collective production. They have only one objective, namely, how to make the collective economy grow and prosper so that all can become affluent in the shortest time possible. When the collective meets with difficulties, everybody will try by all ways and means to resolve the difficulties. For example, when a commune or production brigade plans to start industrial sideline production but is short of funds, the commune members enthusiastically raise the necessary funds. Some offer money from their own reserves that were put aside for marriage or house building, while others loan their surplus grain to the production team at a discount. The richer they become, the more concerned they are with the state and the greater are their contributions to the state. In 1980, the county supplied over 378 million jin of grain to the state. Of this amount, some 100 million jin was surplus grain which the peasants voluntarily sold to the state. An increasing amount of other agricultural sideline products has also been sold to the state.

The development of material culture has changed certain old habits in the countryside. The commune members have begun to care about hygiene, to have a liking for science, and to be concerned with domestic as well as foreign affairs. Many peasant families currently subscribe to one or two newspapers, while the communes, one after another, are setting up cultural centers. Various kinds of sparetime technical schools have sprung up like bamboo shoots after a spring rain. This is a new picture of the Nanhai countryside not seen over the last several thousands of years.

IV

Since the 3d Plenary Session of the 11th CCP Central Committee, Nanhai County has thoroughly implemented the guidelines and policies of the party Central Committee. In particular, it has grasped the following:

First, it has respected the decision-making or autonomous power of the production teams and has brought into play, and relied on, the commune members' spirit of being masters of their own future.

In the past, anything concerning the fields of production teams, such as what crops to plant, what crops not to plant, when to plant, and when to harvest, was determined from above and the decision was a vertical one. In this way, to be realistic and practical was well-nigh impossible and the masses were unable to display their spirit of being masters. After the third plenary session, the Nanhai County party committee, following the principle of being practical and realistic, improved their methods of leadership, respected the autonomous power of the production teams and allowed the peasants the power to determine their own production affairs. First, in regard to politics, they respected the wishes of the commune members, and instituted a democratic system of electing the various levels of leadership. Moreover, they made a bold decision--that of allowing the masses to choose "leaders" from among the county's organs at various levels. The masses were at liberty to recommend, from among the county's organs at various levels and from other units, capable persons suitable for leadership work on the production front and the county committee would then make the necessary follow-up arrangements. Acting on the recommendations of the masses, over the past 2 years, the county party committee has transferred 14 cadres from the various sections and bureaus of the county administration to fill gaps in leadership work at the basic level. In this way, a close relationship with the commune masses has been engendered, the cadres and masses are of one heart and purpose, and good results have been achieved in various kinds of production work.

Second, on the production front, all commune members gained decision-making power on matters ranging from simple production arrangements to scientific farming. In this, the Julong production team of Pingzhou people's commune offers an especially good example. This team is located near Guangzhou and used to be well-known for flower planting and the raising of ornamental fish. However, in the past, the hands of its members were firmly tied by "leftist" restrictions. They were not allowed to plant flowers or to raise fish. Each member was allowed, on average, a plot of land only 0.8 mu in size to grow grain. However, after the third plenary session, they were allowed to make the necessary production arrangements according to their own actual conditions, such as planting flowers, raising fish, producing bricks and tiles, or making rattanware. Thus, by opening wide the production avenues and engaging in multiple forms of operations, they became affluent in only 2 years. What has drawn public commendation is that their flower nursery, which occupies only 3 mu of land, was converted from a tract of wasteland into a "treasure bowl" in less than 2 years. It earns an income as high as 60,000 yuan a year. This shows us that only by earnestly respecting the autonomous rights of the production team can the wisdom and creativeness of the commune members be brought into full play. In regard to such problems as how to make good use of a piece of land, say, only one-tenth of a mu in size, or how to make good use of a pond, or how to bring into full play the various superior conditions or the special talents of an individual, they are perfectly capable of giving the matter careful thought and making the necessary and satisfactory arrangements. In this way production will certainly succeed.

Second, the county has adopted the production responsibility system in its various forms and has fully carried out the principle of distribution according to work.

In the past, under the influence of "leftist" thought, this socialist basic principle of distribution according to work was unreasonably criticized as being capitalist. For years, the practice of making only a rough calculation of work points and "eating out of one big pot" had seriously dampened the enthusiasm of the broad masses of commune members. Since the third plenary session, comrades in Nanhai County have overcome egalitarianism and carried out the principle of distribution according to work, grasping these steps as pivotal points in emancipating and developing the productive forces. Based on the actual condition of the solid strength of the collective economy in this county, the rapid growth rate in production and the high level of distribution as well as the wishes of the broad masses of commune members, these comrades have comprehensively implemented the system of assigning responsibility to specialists and linking remuneration to output for production personnel. They have also implemented the system of assigning responsibility for task completion in financial affairs to financial and accounting personnel and the responsibility system of cadres and administrative personnel taking personal responsibility for tasks. Since these various forms of the responsibility system are directly linked to the material interests of the individual, they have outstandingly activated the production enthusiasm of the cadres and the masses. The Xincun East brigade of Pingzhou people's commune had long been known for its poor performance in production. In the year before last, it adopted the system of assigning responsibility for production and linking remuneration to output and forthwith its appearance was changed. Its average grain yield per mu rose from 1,240 jin in 1979 to 1,670 jin, and the average per capita income of its members increased from 144 yuan to 310 yuan, an increase of more than 100 percent.

Third, the county has promoted industrial sideline production among its communes and brigades and brought into full play its own superior conditions in this respect. Nanhai County borders Guangzhou and Foshan. It is an extremely advantageous position to develop the commodity economy. Unfortunately, in the past, under the influence of "leftist" thought, its superiority in this regard was labelled as a "breeding soil for capitalism" and it was subjected to various criticisms and slanderous slogans such as the criticism of the so-called "three heavy's and three light's," and to calls urging that the "tail of private ownership" be cut off, that the "underground factories" be uprooted, that the "upstarts" be struggled against, and so on. During the 10 years of domestic turmoil, it actually happened that in a locality such as Nanhai, which is gifted with good natural conditions, some production teams could earn only several fen a day. This is hardly imaginable. It made people ask in disgust: "Could this be socialism?"

Fortunately, the mist of dismay in the people's hearts was wiped away by the third plenary session of the party. Since then, the people have begun to realize that the universal poverty was not caused by real socialism but rather by the fake socialism of the "gang of four." In order to quickly enrich the peasants, the county party committee advocated the slogan "three-horse carts can pull a load faster than two-horse carts." It rectified the former rule permitting only the commune and the production brigade, but not the production team, to engage in industrial production. It encouraged production teams to go all out in industrial sideline production. Thus, they were able to realize the concept of "making the best and fullest use of the advantageous conditions of a locality, the value of materials and the talents of the individual." In 1980, the gross income derived from industrial sideline occupations by production teams in the whole county amounted to nearly 100 million yuan, an increase of two times over that of the preceding year. This alone increased the average income per person by 120 yuan. Concurrently with extensively taking industrial sideline production, the teams, acting in the Chinese proverbial manner of the "eight immortals crossing the sea, each one showing his special prowess," developed various pursuits such as planting fruit trees, melons, vegetables and flowers; lumbering; raising birds, insects, fish and so on--all of which have become broad avenues for the advance to wealth and success.

Never before have the people of Nanhai been so full of confidence in socialism as they are today. They are determined, under the party's leadership, to struggle for the realization of the target set by the Nanhai County party congress, of building a "socialist new Nanhai which is industrialized, abounds with gardens and forests, is economically and collectively developed, and which has a beautiful environment and people enjoying a rich and prosperous life."

CARRY FORWARD THE SPIRIT OF REVOLUTIONARY HEROISM

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 42-44

[Article in "Learning From the Chinese Women's Volleyball Team" column by Liu Junqi [0491 0193 2978]]

[Text] The championship won by the Chinese women's volleyball team in the third world volleyball cup finals has inspired the revolutionary enthusiasm of the broad masses of cadres and people. We must learn from the revolutionary heroism of the members of the Chinese women's volleyball team, which is characterized by hard training, heroic stubbornness, hard struggle and daring to win victory.

In order to learn from the spirit of the team and carry forward revolutionary heroism, it is imperative for us to follow the example of the team in cherishing great ideals and aspirations. Great achievement stems from great ideals. We will be able to maintain our steadfastness, to have a definite orientation, to arouse our spirit, to be stubborn and to persist in our fight only when we have a firm proletarian world outlook. In their revolutionary struggles, the proletariat has always combined work with great ideals and carried out all work vigorously. Such is the attitude of the women's volleyball team. The players of the team have always put the interests of the party and the people before everything else. They play volleyball for the revolution, and they have combined their revolutionary faith with their actions and spared no efforts to play every match well. They say: "The 1 billion people are concerned about us, and the prestige of the motherland comes above all other considerations." Their goal is to "wave the flag, receive medals and win championships." They never think of personal gain or loss. They are determined to change the backward situation in the three types of ball sports in our country and "view each match as a step toward remedying this situation." With this goal in mind, they have experienced countless difficulties, played a match even when they were sick, and put off love and marriage. They take as their motto the words spoken by the country's veteran sportsman Jong Guotuan: "We have a limited chance to fight in our life." With this motto, they trained stubbornly and eagerly to improve their individual skills and their team coordination. Owing to their efforts, they won the world championship and defeated many strong rivals because of their unique style and skills. The ideal for which they had been fighting was realized. Such a spirit of great ideals and aspirations and hard work is valuable, and we need it in carrying out revolution and the construction and modernization program. This spirit is an indispensable and great motive force for social progress, development of the state and the boosting of the morale of the nation. The "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC," pointed out: "In the new historical period, all members of the party and the people of various nationalities across the country must continue to maintain lofty revolutionary ideals and revolutionary vigor and carry out the great socialist revolution and socialist construction to the end." The socialist modernization program now being carried out in our country is on a grand scale and is a hard task. It can in no way be carried out smoothly; on the contrary, our road of progress will no doubt be full of contradictions, difficulties and setbacks. Consequently, it is imperative for us, under the party's leadership, to cherish great ideals and aspirations, display our initiative in directing history, solve contradictions, overcome difficulties, and do a good job in building material and spiritual civilization. The comrades of the women's volleyball team have set a brilliant example for us, and we must learn to emulate them in our actions. The cause of our country will be very hopeful if we all act like the members of the women's volleyball team.

In learning from the spirit of the women's volleyball team and in carrying forward revolutionary heroism, we must follow the attitude of the players, which is characterized by hard work, dauntlessness, and stubbornness in overcoming difficulties and in winning victory. The attitude to be taken by revolutionaries toward difficulties and obstacles on the road of advance is an important question. According to the teachings of Comrade Mao Zedong, we must despite difficulties strategically and pay attention to them tactically, and surmount difficulties with doggedness. This is what the comrades on the team have done. In the past China was quite backward in three types of ball sports and it required strenuous effort to reach world standards. Displaying the revolutionary spirit of fearing neither "hardship nor death," the members of the women's volleyball team decided to catch up, whatever the cost, and for this purpose they were ready to sacrifice everything to obtain their goal. Over the past few years, they have proceeded from actual matches and carried out strenuous and scientific training characterized by difficult maneuvers and strict requirements. They would not take their meals or rest until they completed their training. Ignoring fatigue, they would not leave the battlefield even when they were injured. They played each game with the spirit of "winning the game at the cost of their lives." They understood that in order to reach the world standard they had to train hard, that when hardship ends joy will come and that the "blossoms of victory would burst forth in the form of sweat." With a stubborn will and determination, they have surmounted various difficulties and obstacles, climbed tortuous paths, and advanced with every gust of wind and with every wave. It would have been impossible for them to have defeated so many strong rivals and win the great victory in the world volleyball arena without carrying out regular and hard training and mastering the necessary skills. This fact proves that as long as we are able to pay attention to difficulties and spare no efforts to overcome them, we will be able to create miracles. In fact, the history of the Chinese revolution is one of strenuous struggle by the Chinese people. Recalling the past, we still remember that the old China was characterized by a backward economy, backward culture and backward physical culture, and China was ridiculed as the "sickman of east Asia." Under the leadership of the party and through protracted revolutionary struggles, the Chinese people ultimately overthrew the three big mountains of imperialism, feudalism and bureaucratic capitalism and established the People's Republic of China. Following the tremendous victories in socialist revolution and construction, our various causes, including physical culture, have made great progress. The Chinese people quickly removed the label of the "sickman of east Asia" and stood anew among the nations in the world. It can be said that backwardness in itself is not dreadful, but what is dreadful is the spirit of accomplishing nothing and of being content with backward situations. Lu Xun said: "When I am watching sports I often think that the winners are respectable; the runners who lag behind and persist in running to the finish line and those who watch them with respect and without laughing are the pillars of China's future." The women of the team and the hundreds of thousands of people who are working hard on various fronts are the ones praised by Lu Xun as having the spirit of being confident in the face of backwardness, undaunted in the face of difficulties, able to constantly find strength within themselves and to work with perseverance. These people are the real pillars for building the morale of the Chinese people and the motherland.

In learning from the spirit of the team and carrying forward revolutionary heroism, it is imperative to follow the examples of the team's members in combining the lofty aspiration to climb to the top with the spirit of being down-to-earth, and hard working so as to become actual doers and promoters. The proletariat and the working people are direct producers and creators of the goods and wealth in the world; they are modest doers. They understand that in revolutionary struggles and daily life they have to personally take part in practice so as to attain their anticipated goals. The team has also set an example in this aspect. The members of the team considered neither fame nor gain and dedicated their lives to physical culture with a strong sense of responsibility for their work. The team has changed from being weak to being strong, from being backward to being advanced and from being unknown to being famous at home and abroad, and this was made possible through hard training and work on the part of the players. There have been changes in the team's membership since it was formed, but all along it has carried out hard training with strict demands and worked painstakingly. Therefore, the team members are the actual doers that merit respect. They considered it meaningful that they are able to have exciting lives during their youth. They say: "When we all become old and recall our life today, we will certainly feel proud. This is because our lives have been meaningful and our youth had been dedicated to the motherland." What vivid and moving words! These words fully reflect the beautiful souls and deeds of the players. Those who speak empty words and are reluctant to do their work in a down-to-earth way should be enlightened upon heaving these words. It will not do to simply lie, brag or speak empty words. We can only do our work in a down-to-earth way. Lenin said: "Talk less beautiful words and do more daily ordinary work." Comrade Zhou Enlai said in his poem "Part and Never To Meet Again": "When we sit and talk, how can we stand and walk?" All these are useful sayings. Great ideals can be realized only through actual deeds, and difficulties and obstacles can be resolved only through actual deeds, and the edifice of socialism can also be completed only through actual deeds. We must follow the example of the comrades of the women's volleyball team, do our work strenuously and promote the development of our cause.

There are no difficulties in the world we cannot overcome as long as we dare to climb. Our country is now experiencing a new historical period; therefore, it is imperative for us, under the leadership of the party and led by hundreds of thousands of heroes, to form a vigorous revolutionary army to overcome various difficulties and obstacles on our road to advance and to realize the great goal of the modernization program. The victory won by the team has inspired the Chinese people and strengthened their national confidence. What the team could do, all other trades can also do. The whole of China can be changed from being backward to being advanced and can become one of the world's strong countries. Since the players were able to fully display their skills in international competition and win merit for the motherland, likewise, millions of Chinese people who also cherish ideals can also achieve great changes for the country. We must inspire revolutionary spirit, display revolutionary vigor, lose no time to catch up, march forward courageously, and make contributions to realizing the modernization program and to building our country into a powerful socialist country with a high level of democracy and civilization so as to live up to the expectations of our forefathers and the succeeding generations.

LEARN FROM THE COLLECTIVE SPIRIT OF THE WOMEN'S VOLLEYBALL TEAM

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 44-45

[Article in the "Learning From the Chinese Women's Volleyball Team" column by Sun Shijie [1327 1102 2638]]

[Text] The history of the struggle of the Chinese women's volleyball team, characterized by hard training and close cooperation, is a song of collective spirit.

It has been a long dream of all members of the team to win the world championship and win merit for their socialist motherland. To realize such a goal naturally required each member of the team to have high skills, but what is more important is that the team had to be turned into a strong collective with close coordination and unity in their fight. The comrades of the team deeply realized through practice that volleyball is a sports event characterized by collectivity and that individual skills can be improved only through the collective, and they can display their roles only through collective efforts in matches. They also realized that if they lack the collective spirit and discipline related to such a spirit, they would not be able to defeat so many strong rivals in sharp competition even if they had mastered the skills. Consequently, in their "march toward the world" they had the national condition at heart, put the interest of the collective in first place, and closely united and supported each other for the common goal and eventually formed a very good interrelationship. Such a collecgive spirit has become the standard for their life and morale and the source of their wisdom and strength. In particular, when they are in very adverse conditions, they will be able to draw on incomparable courage and confidence from their collective spirit and to fight dauntlessly for the victory of the collective cause.

Of course, it is not easy to handle well the relationship between individuals and the collective and to nurture a highly collective spirit. It requires a protracted and stubborn education and tempering.

The members of the team are ordinary people in their life; they have no so-called inborn miraculous power. They have sweated and shed tears during unprecedentedly hard and strenuous training, and they often experienced temporary misunderstandings among themselves because of the mistakes made during competition. All this required a process of correctly handling the contradictions between the individual and the collective. When a member of the team, Chen Zhaodi, fell on the floor and could hardly move during hard training, she quietly scolded instructor Yuan as "cold-blooded," and Sun Jinfang made a face during a fierce match because another player, Lang Ping, did not take her hint. All this serves as a vivid example of the contradictions. Such contradictions are real and convincing, but they are not in the interests of cooperation during a match. Thus, as contradictions constantly cropped up and were constantly resolved, the misunderstandings among the players vanished and they became more and more amicable both in their thinking and feelings, and eventually they cherished the collective spirit profoundly. Within the ranks of members of the team, the coaches are closely united and cooperate with the players, and this is also the situation with regard to players on the field and reserve players and with regard to second passers and main attackers. The reason for this situation is that they are all linked by collective thinking. If we broaden the field of our vision and think of the nameless heroes who are responsible for accompanying them during training and doing logistics work, of the veteran players who have been tirelessly working for the "emancipation of big balls," and of the concern and encouragement of the hundreds of millions of Chinese people, compatriots in Hong Kong and Macao, overseas Chinese and international friends, we will further understand that "the championship that we have been struggling for has at last been won by the players" and consequently we can see the brilliance of the proletarian collective spirit.

A number of bourgeois scholars have put forward the view that "proletarian collectivism means the elimination of personality." Is this true? The practice of the women's volleyball team has powerfully refuted this view.

The team's coach, Comrade Yuan Weimin, said: "The 12 members of the team will be able to play with flying colors only when they have their own personalities. If their personalities are at ground-level, the team will be hopeless." What a good expression! We can say that Yuan Weimin is not only a volleyball coach with specialized skills, but also an ideological worker who understands Marxist dialectics. Thus, under his guidance and that of deputy coach Deng Ruozeng, each member of the team has her own skills and character. For example, Sun Jinfang is agile, Lang Ping is straightforward, Zhang Rongfang is calm, Chen Zhaodi is pungent, Cao Huiying is quiet, Chen Yajing is stubborn, Zhang Jieyun is ingenious, Zhou Xiaolan is decisive, Liang Yan is shy, Zhu Ling is lively, Zhou Luming is clever, and Yang Xi is natural and unrestrained. In short, each has her own character. They are not made out of one mold. Therefore, we can clearly see that, instead of eliminating personality, the collective provides full conditions for developing personality. Marx and Engels said: "It is only in the collective that individuals will be able to acquire the means for making al all-round development; that is to say, they will have individual freedom only in the collective." ("Selected Works of Marx and Engels," vol 1, p 82).

Stalin once compared the Marxist view on the correct relationship between the individual and the collective with the anarchic view, and he made a comprehensive theoretical generalization when he said: "Anarchism, which is based on individuals, holds liberating individuals as an important condition for liberating the masses and the collective. According to the anarchic viewpoint, there will be no mass liberation until individuals are liberated and consequently its slogan is 'all for the individual.' On the other hand, Marxism is based on the masses and it holds that mass liberation is the main condition for the liberation of individuals. That is to say, according to the Marxist viewpoint, there will be no individual liberation until the masses are liberated. Therefore, the Marxist slogan is 'all for the masses'." ("Collected Works of Stalin," vol 1, p 273).

The collective cause that is characterized by joint struggle improves and develops individual talent, while a full display of individual talent guarantees the victory of the collective cause. Such is the correct relationship between the individual and the collective, which has been vividly reflected by the women's volleyball team. It is becamse the team realized the dialectical unity between general character and individual character that it has become a harmonious, lively, strong team and has come first in the international volleyball arena. And when the members of the team mounted the rostrum as world champions amid a solemn atmosphere and when the five-starred Red Flag was being hoisted, they did not rejoice with the mean and selfish joy of individualism but with the feelings of collective proudness for the great motherland and the whole nation. In such an exciting atmosphere, the heroines of the team profoundly felt that they "were the happiest people in the world" and such feelings represent the most ardent praise for proletarian collectivism.

The proletarian collective spirit shows the nature of communist morality, and it is the core of socialist spiritual civilization. To correctly combine the interests of the collective, the state and the individual should be the socialist economic principle and the principle for socialist morality. To see things from such a high point, we can understand that the lofty collective spirit displayed by the women's volleyball team, just like its patriotism and revolutionary heroism, constitutes a spiritual wealth which is highly significant for the cadres and the masses on various fronts and a vivid manifestation of the spirit of the socialist era. Our work will be done better and better and our country will become strong as long as we are able to conscientiously learn from and display such a spirit and use it in the practice of the socialist modernization program.

THE IMPACT OF THE ENERGY QUESTION ON THE ECONOMIES OF THE DEVELOPED CAPITALIST COUNTRIES

Beijing RED FLAG in Chinese No 2, 16 Jan 82 pp 46-48

[Article in "Forum on Economic Problems of Imperialism" column by Qian Jinxi [6929 0093 2497]]

[Text] Crude oil is a type of energy which has good flammable qualities and a high calorific value, and can be stored and transported readily. It occupies a proportion of 56 percent of the world's structure of primary sources of consumable energy. Together with natural gas, its natural partner and close associate in both storage and collection, the combined proportion is over 70 percent. Hence, the current talk about the energy problem of the world economy is essentially talk about crude oil.

Since crude oil is an indispensable source of energy for the nations of the world, particularly for the developed capitalist countries, it occupies an important position in world trade. At present, trade in crude oil accounts for 22 percent of the gross volume of world trade. It makes up 51 percent of the gross tonnage of the world's export commodities, and the oil tanker fleet accounts for 44 percent of the gross world tonnage of oceangoing vessels. Hence, whenever internationally there is a crisis in crude oil supply or a sudden rise in the price of oil, the economies of the developed capitalist countries are tremendously affected.

The world's concern with the crude oil problem began in the 1970's. Prior to that time, although the oil-producing countries in Asia, Africa and Latin America had already started a series of struggles for the protection of their own oil interests and had at various times achieved successes in such matters as the crude oil tax rate, marked prices, share participation rights, nationalization, and so on, yet for a time the power of fixing oil prices remained in the hands of the world's transnational oil corporations. All the Western countries did their best to keep the oil price low so that they could reap exhorbitant profits. In the 1950's and 1960's, the economy of the imperialist world rose rapidly. One of the basic reasons for this success was the plunder from the developing countries of large quantities of crude oil, a cheap and good-quality source of energy.

As a result of this plunder from abroad, the capitalist countries found themselves becoming increasingly dependent on imported oil. After the Middle East hostilities in October 1973, the Arab oil-producing countries enforced an embargo on oil exports to the United States, West Europe and Japan. This caused a serious oil crisis in these countries. The consequences were that many plants had to shut down, transport capacity was drastically curbed, goods piled up in wharves and storage areas, and there were long lines in gasoline filling stations. The oil embargo was subsequently lifted, but the Organization of Petroleum Exporting Countries [OPEC] soon announced their decision to take back the power of fixing oil prices. Beginning from 1 January 1974, the basic oil price was raised from $3.011 to $10.651 per barrel. At the same time, the petroleum monopoly corporations of the West took the opportunity to raise the spot price of oil on the market in order to reap exhorbitant profits for themselves. This was the first steep rise in oil prices after the war. Naturally, it was a serious blow to Western countries, which heavily depended on crude oil for domestic consumption and had to depend heavily on imported oil. Without doubt, it played an important role in causing and aggravating the serious 1974-1975 postwar economic crisis in the Western world.

Since 1979, the crude oil market in the West has been full of vacillations and changes. Oil supply on the market was tight at times, but it eased slightly at other times. For example, in the early autumn of 1980, the stockpile of crude oil in the West had reached a saturation point and on the international market there had been a surplus of crude oil averaging 2.5 million barrels a day. Soon afterward, in September, hostilities erupted between Iran and Iraq. Badly battered by the war, both nations suspended their oil exports,and on the international market oil supply was reduced by about 3.5 million barrels a day. Meanwhile, the price of oil was rising steeply. By 1 January 1981, OPEC announced that Saudi Arabia's basic oil price would be $32 per barrel while the highest oil price from other sources ranged from $36 to $41 per barrel. This represented an increase of 3 to 3.5 times compared with the oil price in 1978. Beginning from the first quarter of 1981, owing to the steady decline in the Western economy and the enforcement of various oil economy measures, oil consumption declined. On the world oil market, there was a surplus of an average of 2 million barrels a day. The price of oil stabilized and actually dropped slightly. In October 1981, OPEC agreed on a new unified oil price: the standard oil price was fixed at $34 per barrel. At present, in the capitalist world the supply and demand of energy is generally in a balanced state. The oil price can be expected to remain stable for a period of time. In this way, the second steep rise in oil price, which had lasted for 2 years, came to a close.

Nevertheless, factors can still be found working for another steep rise in the oil price. They are: 1) In accordance with the law of the cyclical movement of the capitalist energy economy, a stability in oil price can very well promote an economic recovery, which in turn will result in a rise in oil consumption and in another shortage in oil supply. 2) More recently, in an effort to curtail the purchase of oil at a high price, the capitalist countries have dipped heavily into their oil reserves and as a consequence their oil stockpile has been gradually diminishing. When replenishment is due in the future, the market will be affected. 3) The war between Iran and Iraq is still continuing. Even when the war ends it will still not be easy for these countries to quickly restore their full oil production and export capacity. 4) The geographical distribution of oil deposits and production in the world is still very unbalanced. Contradictions between the petroleum-exporting countries and the major petroleum-consuming countries might yet be intensified. Thus, another steep rise in the oil price can hardly be avoided.

II

The large-scale rise in the price of crude oil in 1973 was a serious blow to the economies of the Western countries, which were then in a state of "stagflation." Its impact was rather broad. The outstanding features were as follows:

1. It reduced the speed of the growth of the economies of the Western countries. A lack of energy supply frequently impeded the development of the national economy. It was estimated that the impact of every 10 percent rise in the oil price caused a drop of 0.35 percent in the value of the gross national product of the Western countries.

2. It increased the international payments deficits of the Western countries and reversed, in part, the direction of their capital exportation. In 1978, before the second upheaval in the oil price, the developed capitalist countries had a surplus of $31 billion in their ordinary revenues and expenditures. In the course of the price rise, the surplus became a deficit. In 1979, the deficit was $35 billion and in 1980 it increased to $73 billion. From 1974 to 1978, as a result of the price rise, OPEC obtained a large amount of petrodollars, amounting to $660 billion in all. Of this, 75 percent was subsequently spend on importing commodities and labor services from the Western countries and on purchases of real estate there, or were deposited in Western banks or invested in Western enterprises. In 1979 and 1980, OPEC reaped a surplus of $184 billion from their ordinary revenues and expenditures. Of this surplus, a sizable amount flowed back to the Western countries. In this way, on the international capital market, aside from the developed capitalist countries exporting capital to the developing countries, a new feature developed, namely, the developing countries also transferred their capital funds to the developed countries.

3. It aggravated the currency inflation in the Western countries. During the period of the large-scale rise in the oil price, a high tide of currency inflation occurred in the Western countries. In the nine-nation West European community, the rate of currency inflation was 6.8 percent in 1979. It went up to 8.9 percent in 1979 and climbed to over 12 percent in 1980. In 1980, the growth rate of currency supply in the United States surpassed the original target of 6.5 percent and went up to over 8 percent.

In short, the steep rise in oil price aggravated the "stagflation" of the Western economies and weakened the economic potential of the Western countries.

III

The tremendous impact of the rise in oil price on the Western economies forced the various Western countries to adopt countermeasures to lessen the effect on their economies as well as to find a way out. The measures taken can be summarized as follows:

1. Formulation of a detailed energy policy and mapping out a general outline for energy supply; and establishment of an energy planning center which devotes its efforts to raising the effective utilization rate of energy and at the same time lowering the growth rate of energy consumption. For example, the policy outlines of countries like the United States, Japan, West Germany, France and Canada all had as their starting point an economic evaluation of the supply sources of the multiple forms of energy or of an individual source of energy, and proceeded with a comprehensive survey of the various phases relating to energy such as prospecting, developing, geographical distribution, price structure, allocation, comprehensive utilization, and the import and export trade. They served as the basis for the subsequent formulation of detailed guidelines, laws and regulations.

2. Development of multiple forms of energy and changing the energy consumption composition, such as raising the proportions of coal, nuclear energy, and hydroelectricity in the energy consumption makeup, and at the same time lowering the relevant proportions of crude oil and natural gas in the makeup and paying great attention to the utilization of energy that can be regenerated or reclaimed. In particular, the work on conversion of coal into a liquid or gaseous state has been given much attention by the various countries. In June 1980, the American Government snactioned an appropriation of $25 billion for the establishment of a special organ to study and promote synthetic fuels. Likewise, commencing in 1979, the Japanese Government strengthened research on the development of substitute forms of energy, particularly nuclear power generation. It is estimated that by the year 2000, in the primary energy consumption makeup of the Western countries, the proportions of crude oil and natural gas will decline respectively to 37 percent and 16 percent, whereas the proportions of coal, nuclear energy, hydroelectricity and solar energy, and synthetic fuels will possibly rise respectively to 24 percent, 10 percent, 9 percent and 4 percent.

3. Stepping up the prospecting and development of new oil areas. In the past, certain large oil areas in the Western countries such as those in the North Sea, Alaska and the sea areas of the United States adjacent to the Gulf of Mexico had seldom been developed owing to various deterrent factors such as poor natural conditions, or the complex nature of the oil deposits, or the extraction cost being much higher than the selling price. However, since the rise in oil prices, the production cost has become lower than the

selling price and, as a result, in the 1970's, commercial production was resumed in these areas one after another. Of them, the oil fields in the North Sea and Alaska have become the largest areas in West Europe and North America respectively. But the confirmed oil deposits of the North Sea oilfield are 3.2 billion tons and the output is about 100 million tons (1 year) while the confirmed deposits in the Alaska oilfield are 1.2 billion tons and the annual output is 70 million tons. Neither of them can offset the enormous deficit between oil production and consumption where they are located, namely, about 600 million tons in West Europe and about 400 million tons in the United States. Thus far they have been able only to resolve the problem of energy shortage in individual countries like England and Norway. For this reason, recently the United States has begun the exploration and development of the "(Nanpo) [0589 0980] oilfield" on the northern shore of the Gulf of Mexico and the adjacent exploratory fields outside the gulf. Likewise, Britain has proceeded with prospecting in the Irish Sea and the English Channel.

4. Improving the oil extraction or procurement rate. The extraction or procurement of crude oil is divided into three stages. At present, it is confined mainly to the primary and secondary stages. Western countries are now turning their attention to studying the methodology for the third stage. It is estimated that if this stage can be extensively developed, the equivalent of an increase of 20 to 30 percent in the volume of crude oil deposits will be effected.

5. Taking the road of "pluralization" in crude oil trade. For Western countries which are short of oil, ensuring the source of supply is highly important. These countries are deeply aware of the uncertainty of the political conditions in the petroleum-exporting countries and the wide divergence in their economic policies. Hence, the overcentralization in any one locality in the geographical distribution of foreign trade in crude oil is highly disadvantageous. Therefore, they strive for "pluralization" of the petroleum trade. Take the United States for example: following the large-scale rise in oil price for the second time, it has increased its oil imports from Saudi Arabia, Nigeria, Mexico, Indonesia, Britain and Norway. Formerly, Japan derived 90 percent of its oil imports from the Middle East. Now, its imports from the Middle East have dropped to 78 percent and imports from Southeast Asia have increased to 15 percent. In addition, plans are being made to expand its imports from China, Mexico, the Soviet Union and Africa. Western Europe has also increased its oil imports from Africa, the Soviet Union and Central and South America. In particular, since the sharp decline in oil exports from Iran and Iraq, the Soviet Union has become West Europe's second largest supplier of crude oil next to Saudi Arabia.

6. Establishment of energy-saving organs and strengthening of energy-saving work. For example, in 1974 France established an energy-saving bureau and in 1976 a transdepartmental energy-saving commission. Many other Western countries have set up similar organs. All the countries have adopted guidelines encouraging and promoting energy-saving measures and conversely imposing sanctions on wasteful practices in energy consumption. On the side

of encouragement, special privileges are given to industrial enterprises in the form of providing them with funds and equipment for the installation and use of energy-saving facilities or granting them loans at low interest rates for the installation of energy-saving facilities. To encourage residences and households to save energy, heat-insulating materials are supplied to them and solar collectors are installed. Economic sanctions are imposed on enterprises and individuals that violate energy-saving regulations. A surplus tax is levied on enterprises whose products are found to have exceeded the prescribed standard for energy consumption. Take, for example, fuel consumption of motor vehicles: the American government originally stipulated that 1975 ex-factory motor vehicles must attain the target of 18 miles per gallon of gasoline. In 1980, the target was raised to 20 miles per gallon, and it is planned that by 1985 the target will again be raised, to 27.5 miles per gallon. In order to attain this objective, the motor vehicle manufacturing industry is currently engaged in renovation work starting with the car engine and embracing the car body and tires.

Developed capitalist countries have adopted various measures and policies aimed at energy development and savings. They have devoted large amounts of capital and labor power to the energy departments within their countries. They have transferred to the developing countries those production departments which habitually consume large quantities of energy. In short, they have resorted to various ways and means to cut down their energy consumption and thereby reduce their overdependence on foreign countries. Needless to say, these policies and measures have had a considerable impact on the world's distribution of productive forces and on the economic structure and economic development of the developed capitalist countries. However, within a fairly lengthy period, it will still be impossible to basically change the production and consumption structure of energy in the world or to change the state in which the developed capitalist countries depend on the developing countries for oil or to replace all at once crude oil with a new kind of energy that will take over the top-ranking energy position. Hence, the economy of the capitalist countries will continue to be harassed by the energy question.

HOW DID LIU SHAOQI COMMENT ON 'THE INSIDE STORY OF THE QING COURT'

Beijing RED FLAG in Chinese No 2, 16 Jan 82 inside back cover

[Article by Wu Zhitang [0702 2535 2768]]

[Text] How did Comrade Liu Shaoqi comment on the film "The Inside Story of the Qing Court" when it was screened shortly after the founding of the People's Republic? Did he really praise it as a "patriotic" work? This has been a question of public concern for over a decade.

The origin of the question has to be traced back to the spring of 1967. On 1 April that year, Qi Benyu trotted out an article entitled "Patriotism or National Betrayal?--Commenting on the Reactionary Film 'The Inside Stofy of the Qing Court.'" In this article, he obstinately asserted that Comrade Liu Shaoqi once lauded "The Inside Story of the Qing Court" as a "patriotic" film. Seizing on this, he went on to sling mud at Comrade Liu Shaoqi, saying that Liu had all along practiced "national betrayal" and was "the top party person in power taking the capitalist road." He was not going to be content with anything less than Liu Shaoqi's destruction. The real facts of history show that all these allegations were charges fabricated by Lin Biao, Jiang Qing and Qi Benyu for the purpose of framing Comrade Liu Shaoqi.

In fact, shortly after the screening of the film "The Inside Story of the Qing Court," Comrade Liu Shaoqi, just like Comrade Mao Zedong, held a critical opinion of the film's ideological trend and deemed that it preached reformism. This was clearly reflected in Comrade Liu Shaoqi's speech at a study forum organized by the CPPCC National Committee for Democratic Personages.

Comrade Liu Shaoqi's speech that day focused on the study of Marxism-Leninism and the question of the interrelationship between reforming the objective world and reforming the subjective world. Discussing the film "The Inside Story of the Qing Court" in connection with the widespread movements carried out at that time commencing with the movements for land reform, to resist the United States and aid Korea and to suppress the counterrevolutionaries, he criticized this film and said it was not worth any positive appraisal because it preached reformism. He said: "The Inside Story of the Qing Court" preaches reformism. It gives people the impression that had Guang Xu been able to do this or that, we could have lived without the revolution, without

Dr Sun Yat-sen and even without what we are pursuing now. Comrade Liu Shaoqi also pointed out: Reformism has been tried out, but it did not work. There is no compromise on the question of class struggle. In a given historical period in the development of a society, it is necessary to overthrow the reactionary class in the interest of the overwhelming majority of the people. Today, if you wholeheartedly support land reform instead of opposing it, you stand for truth and progress. The same applies to the building of socialism in the future. It is evident that in these remarks, Comrade Liu Shaoqi was criticizing the ideological trend of the film "The Inside Story of the Qing Court" as reformist. He had no intention whatsoever of lauding it as patriotic.

It was precisely for this reason that when Qi Benyu's defamatory article was trotted out, Comrade Liu Shaoqi was able to justifiably knock the bottom out of this violent attack which stood truth on its head and confused enemy with friend and say: "There are many lies in this article. When did I say that this film (referring to "The Inside Story of the Qing Court") was patriotic? When did I talk about becoming a "Red comprador'? These claims do not tally with facts and are false charges." These few forceful words have hit the nail on the head and laid bare the whole essence of the question.

Lies written in ink cannot change the iron-clas facts of history. As the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC" pointed out: "Irrefutable facts have proved that labeling Comrade Liu Shaoqi a "renegade, hidden traitor and scab' was nothing but a frameup by Lin Biao, Jiang Qing and their followers." Irrefutable facts have also repudiated all the slander and libel of Comrade Liu Shaoqi by Lin Biao, Jiang Qing and their followers in connection with the film "The Inside Story of the Qing Court."

ENHANCE PARTY SPIRIT, STRIVE FOR A FUNDAMENTAL TURN FOR THE BETTER IN PARTY SPIRIT

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 2-14

[Article by Zhang Yun [4545 5686]]

[Text] The problem of party work style is a very important task in party building and a matter of primary importance with which people inside and outside the party are concerned. I would like to talk about my understanding and thoughts on this problem.

The Relationship Between Party Work Style and Party Spirit

A stream has its source and a tree has its roots. Party spirit determines party work style and the latter is the manifestation of the former. To talk about the problem of party work style, we should, first of all, be clear about party spirit and the relationship between party spirit and party work style.

What is called party spirit is the intrinsic nature of a political party. The Chinese Communist Party is the vanguard organization of the Chinese proletariat, the nucleus of the socialist cause in China and the faithful representative of the interests of the people of various nationalities in China. Our party's intrinsic characteristics, which are different from those of other political parties, formulate our party spirit. Each and every Communist Party member should acquire this party spirit. Comrade Liu Shaoqi said explicitly: "The party spirit of Communist Party members is the highest expression of the principled nature of the proletariat, the intrinsic quality of the proletariat and the highest and most concentrated expression of the interests of the proletariat. The tempering and cultivation of the party spirit of Communist Party members are the reform of the innate character of the party members themselves." ("How To Be a Good Communist," pp 94-95, People's Publishing House, August 1949) What does party spirit encompass, then?

We should take Marxism-Leninism-Mao Zedong Thought as the theoretical basis guiding the thinking of our party. This is the first important principle of the theoretical nature of our party spirit. In accordance with the principle of combining theory with practice, we should unswervingly use

Marxism-Leninism-Mao Zedong Thought to guide all the actions of our party, conscientiously study and use the stand, viewpoints and methods of Marxism-Leninism-Mao Zedong Thought to practically deal with new situations occurring in revolutionary practice and solve various new problems. In so doing, we will adhere to party spirit. If we fail to uphold or even abandon the basic principle of Marxism-Leninism-Mao Zedong Thought, or regard it as an ossified dogma while supposedly upholding it, or take a pragmatic attitude to quote out of context and distort it willfully, we will not be adhering to party spirit.

To strive to accomplish the great objectives of wiping out all remnants of the exploiting system and realizing socialism and communism is the second principle of our party spirit. As early as the time of the birth of our party, we had already worked out the party's ultimate program of striving for the realization of socialism and communism. This is a sacred mission entrusted by history to the proletarian revolutionary political parties. Only by unswervingly upholding this lofty belief, can we adhere to party spirit. If we give up this communist ideal and abandon the party's ultimate goal, our party spirit will no longer exist.

Working selflessly and serving the people wholeheartedly is the third principle of the party spirit. The Communist Party stands for the abolition of classes and the implementation of public ownership and collectivism. Thus, it represents the greatest interests of the broad masses of people. The interests of the party are identical with those of the people. The party does not or should not have any narrow and sectarian selfish interests which hold it aloof from the people. We should work selflessly, attach primary importance to the overall interests of the party and the revolution and serve the people wholeheartedly. This is the purpose of our party and an important criterion for being a qualified Communist Party member. The fact that every Communist Party member devotes his energy or even his life to the cause of the party and the people is the most perfect manifestation of party spirit. If a Communist Party member always thinks of his personal interests and disregards the interests of the party and the people or even goes so far as to seek personal gain at the expense of the interests of the party and the people, this means that his party spirit is not pure or that he has not acquired it.

Enforcing iron discipline on the basis of the high level of consciousness on the part of party members is the fourth principle of our party spirit. Ours is a centralized and unified political party which takes democratic centralism as its basic organizational principle. It resolutely follows the practice of "centralism on the basis of democracy and democracy under the guidance of centralism" and resolutely observes the iron discipline that "individuals should follow organizations, the minority should submit to the majority, the lower level is subordinate to the higher level and the whole party must obey the party Central Committee." We absolutely forbid the existence of factions within the party and resolutely oppose any kind of sectarian tendencies and activities in violation of organizational discipline. Such discipline is established on the basis of party members' high level of consciousness. Therefore, it is truly authoritative and powerful.

We should conscientiously act in accordance with the principle of democratic centralism and always uphold the unity and centralism of the entire party. In particular, we should keep in line with the central authorities politically, always uphold the party's strict discipline and constantly strengthen the sense of organization and discipline of the whole party. In so doing, we will uphold the party spirit of the proletarian vanguard. If we allow individualism, anarchism, extreme democracy and factionalism to spread unchecked, the party's organizational principle and iron discipline will be weakened and obstructed. This will lead to an abnormal inner-party political life and will trample upon the principles of our party spirit.

Maintaining close ties with the masses and upholding the mass line is the fifth principle of our party spirit. The mass line is our party's fundamental line. As early as at the party's "seventh congress," Comrade Mao Zedong explicitly pointed out: The fact that we Communist Party members can maintain the closest ties with the broadest masses of people is a marked sign which differentiates us from other political parties. In his "On the Party," Comrade Liu Shaoqi said: "The standpoints of everything for the people, of holding oneself responsible to the people, of having faith in the people's ability to emancipate themselves, and of learning from the people constitute our mass standpoints. These are the standpoints of the vanguard of the people in regard to the people." We should uphold the mass line which is the characteristic of the proletarian political party, fully realize that the interests of the party and people are identical and that the act of holding oneself responsible to the party is the same as that of holding oneself responsible to the people and identify ourselves with the masses. We should share the comforts and hardships of the masses and should not for a moment divorce ourselves from the masses. In so doing, we will uphold party spirit and strengthen it. All erroneous tendencies such as bureaucracy, warlordism, tailism, closed-doorism and so forth will weaken or nullify our party spirit.

We should be very conscientious and never carry out self-criticism perfunctorily and should openly acknowledge and correct our own shortcomings and mistakes. This is the sixth principle of our party spirit. The fact that we conscientiously practice self-criticism and never conceal faults or hide our sickness for fear of treatment or put the blame on others is another hallmark distinguishing the CCP from all other political parties. We can consciously adopt the method of criticism and self-criticism to constantly expose and overcome shortcomings and mistakes occurring in our activities to educate ourselves and the people. This is the quality and character of the Communist Party and where our party spirit lies. We can judge a party member's party style by how he practices self-criticism. Those who fear criticism and self-criticism are not good party members.

The above-mentioned six principles of the party spirit embody, in essence, the intrinsic nature of our Communist Party which strictly distinguishes it from all other political parties. Viewing the situation as a whole, we know that these principles of the party spirit cannot be changed and transformed. If they are changed, transformed or even abolished, our party will lose its nature and characteristics of the proletarian vanguard. In so doing, it will inevitably degenerate, and no longer be a Communist Party. Therefore, party organizations at all levels and comrades of the whole party should always consolidate and strengthen these six principles of party spirit. They are not allowed, in the slightest degree, to weaken and destroy them.

Our party spirit is specifically reflected and embodied in the activities of the party organizations and words and deeds of party members. Those Communist Party members who are truly qualified and not merely nominal should possess this kind of party spirit. However, party spirit possessed by party members as individuals are like fingers which are different in length. Individuals' party spirit might change. Under certain conditions, some individual party members will strengthen or weaken or even lose their party spirit. Those who formerly neglected party spirit might attach importance to and strengthen it. Strong party spirit will become weak and vice versa. Pure party spirit might become impure and vice versa. All these are determined by whether party organizations are constantly providing party members with education on party spirit, whether party members as individuals accept the party education and whether they are able to conscientiously carry out the cultivation and tempering of their party spirit. If one can conscientiously study theories by integrating what he has learned with ideological reform and dares to build up his willpower in revolutionary practice, his party spirit will be strengthened and become purer. Otherwise, his party spirit will be weakened and his revolutionary will lessen or he may even lose his communist outlook. Therefore, to maintain our party's intrinsic character, all our comrades should strengthen the cultivation and tempering of their party spirit and never become lax in their efforts. Young and new party members should exert great efforts. These veteran comrades who have been party members for a long time should also work very hard and take the lead in this respect. During his lifetime, Comrade Zhou Enlai had a well-known saying: "Learn, work and remold yourself as long as you live." "Remold yourself as long as you live" means a process of constantly tempering and cultivating one's party spirit.

Party spirit and party work style cannot be separated from each other. Whether our party work style is healthy is determined by our party spirit. Historical facts have told us: Within our Communist Party, there is no party member whose party spirit is strong but whose party work style is bad. There is no party member who has healthy party work style and very bad party spirit. Party spirit and party work style are in direct proportion. Some people with bad party spirit and unhealthy party work style always take extreme individualism as their jumping-off point. They act according to circumstances and are good at changing their guises and pretending. Outwardly, they act with feigned impartiality, but inwardly they are filthy. Such hypocrites and chameleons have shown their true colors even though they can deceive people for a period of time. They eventually are exposed and come to no good end. Only by constantly strengthening our party spirit can we truly improve our party work style.

The Relationship Between Party Work Style and the Party's Destiny

Since the 3d Plenary Session of the 11th CCP Central Committee, the party Central Committee has repeatedly stressed that we should do well in improving party work style, restoring and carrying forward the party's fine traditions and that we should regard the practice of enforcing party discipline as a matter of primary importance in party building and in bringing order out of chaos. We should grasp this work firmly. Why should we do so? Comrade Chen Yun's remark hits the nail on the head. He said: "The party work style of a ruling party has a direct bearing on the life and death of the party."

Whether the party work style is good or bad determines the people's will. The people's will in turn decides the destiny of the party. The masses of people will never follow the party blindly. They not only "listen to what the party says" but also "watch what it does." They appraise and assess our party based on the activities of party organizations, the behavior of party members and the advantages of the party's line, guiding principles and policies. All these will determine whether they trust and support the party or respond to the party's call to work together with us.

Two kinds of conditions occurred in the party's history. The first condition was: All our party members possessed strong spirit and our party work style was good. The party organizations and party members looked upon the interests of revolution as their very life. They always thought of the masses, trusted and relied on them. They gave due consideration to the overall situation when matters arose, kept the whole situation in mind and were the first to bear hardships and the last to enjoy comforts. They had the masses in mind, and were eager to meet their needs. They never hesitated in shedding blood and making sacrifices in order to safeguard the interests of the masses and strove for the emancipation of the people. They thought and acted as one and their deeds were consistent with their words. The broad masses of people saw all this with their own eyes and were pleased. Therefore, they followed the party wholeheartedly or even supported the revolution and protected the party organizations and party members at the risk of their property and lives. During the years of the revolutionary war and White terror, the People's Army led by the party became more and more powerful. What were the sources of our troops? We mainly relied on millions upon millions of people who voluntarily joined the army. Wives sent their husbands and mothers sent their sons to join the army. They truly vied with one another in signing up for military service! At that time, when our troops fought east and west on many fronts and were both on the offensive and the defensive, logistic support never stopped. Who carried out the transportation work? We mainly relied on millions upon millions of the masses who pushed their carts, drove their donkeys and used their carrying poles. Those magnificent sights were truly earth-shaking and soul-stirring! "Those who are supported by the people will surely prosper." Due to the assistance and support of the broad masses of people, our party overcame one difficulty after another. It was truly invincible.

Another condition is poor party spirit and unhealthy party work style. Party organizations and party members have given top priority to partial and individual interests. They show no consideration whatsoever for the overall situation or effect and always proceed from the advantages or disadvantages of their own units and themselves. They are fond of arrogating power, seeking private gain and resorting to dishonest means. They do not show the slightest concern for the sufferings of the masses and do not mind infringing on or damaging the interests of the masses and riding roughshod over them. They think in one way and behave in another, and their words do not tally with their deeds. Consequently, they have become more and more separated from the masses, turned into "armchair commanders," lost all popular support and suffered a crushing defeat. Judging from the situation as a whole, this kind of condition has never appeared before in the history of our party. Judging from individual places and individual party members, such instances are rather common.

Since party work style has a bearing on the destiny of the party, why did Comrade Chen Yun give prominence to the words "ruling party" and lay special emphasis on "the question of the work style of the ruling party is a matter of vital importance to the party"?

First, following the victory of the revolution, our party shifted from the grim wartime environment to a stable peacetime environment. From the status of being oppressed and massacred, it has become the ruling party of the country controlling enormous state power and national wealth and having contacts with various sectors both at home and abroad. The principal task of the party has shifted from leading the people to seize power to leading the people to consolidate power, constructing the country, building a strong and modern socialist country and creating conditions for the future transition to communism. This is an excellent thing. However, because of the fundamental change in the circumstance and status of the party and the task of the party under the new historical situation, the slightest negligence in party building will also result in new problems, produce certain side effects and affect the change in party work style.

During the revolutionary war years, one had to endure great hardship and run risks in making revolution, and there were not many small personal advantages to be gained. Most of the people who joined the party were dedicated to the revolution. They were always prepared to spill blood, make sacrifices, go to prison or lose their heads, and their revolutionary will was very strong. Speculators and waverers generally would not join, and even those who were swept in by the revolutionary torrent would also be continuously eliminated in the struggle. At the same time, objective circumstances also compelled us to make a success of party work style and to be modest and prudent in the struggle. We had to work hard, go deep into reality and keep in touch with the masses, and we could not practice subjectivism, bureaucratism or seek personal privileges; otherwise, we would be in danger of being defeated and exterminated by the enemy. At that time, the quality of the whole party was very good. Everybody attached greater importance to the tempering of party spirit and consciously improved the party's style of work. Therefore, even when troubles appeared, they were also not difficult to overcome. After the Yanan rectification campaign, our party summed up both the positive as well as negative aspects of the experience since the founding of the party, applied the method of criticism and self-criticism to carry out education on Marxism-Leninism-Mao Zedong Thought and enabled the party spirit of the whole party to be greatly strengthened. This developed into the party's three important styles of work of integrating theory with practice, forging close ties with the masses and practicing self-criticism and fostered the fine traditions of the party. This not only guaranteed the survival of our party and pulled it through the difficult years of the war of resistance against Japan and the liberation war, but also enabled it to keep on developing and growing and to eventually score a nationwide victory with the all-out support of people of various nationalities throughout the country. Our party won lofty prestige among the people of the whole country and the whole world and became known as the great, glorious and correct Chinese Communist Party.

In the face of the great epoch-making victory, under the conditions of suddenly becoming the ruling party of the whole country, what were the problems which were to appear in the party? Comrade Mao Zedong had foreseen them long ago. At the 2d Plenary Session of the 7th CCP Central Committee, he warned the whole party: "With victory, certain moods may grow within the party--arrogance, the airs of a self-styled hero, inertia and unwillingness to make progress, love of pleasure and distaste for continued hard living. With victory, the people will be grateful to us and the bourgeoisie will come forward to flatter us. It has been proved that the enemy cannot conquer us by force of arms. However, the flattery of the bourgeoisie may conquer the weak-willed in our ranks. There may be some communists, who were not conquered by enemies with guns and were worthy of the name of heroes for standing up to these enemies, but who cannot withstand sugar-coated bullets; they will be defeated by sugar-coated bullets. We must guard against such a situation."

This well-meaning advice given by Comrade Mao Zedong was mainly intended for the veteran party members and cadres of that time. However, it is also suitable for the other party members and cadres who have joined the party since the founding of the People's Republic.

On the one hand, there are many good comrades in the party who have remembered Chairman Mao's warning. For the last 30 years, they have stood up to the test of changing environment and conditions and always preserved a strong party spirit and the fine traditions and styles of work of the party. For the sake of the cause of the party and people, they quietly immerse themselves in hard work, labor diligently and uncomplainingly and bend their backs to the task until their dying day. They are worthy of the honor of being called a communist. It is only natural that they are loved and respected by the comrades in the party and the broad masses of people and regarded as models for emulation. To make a success of party building and national construction, we must rely on comrades with this kind of strong party spirit and pure party work style as pillars and mainstays.

On the other hand, we must see that as a result of the change in the environment and status of the party after it came to power in the country, there are definitely quite a number of party members who cannot stand up to the test in this period. Consequently, those conditions which Comrade Mao Zedong warned us to guard against have appeared in varying degrees. The problems which occurred are even more complicated and serious than he had anticipated. Just as the broad outline of the resolution approved at the third plenary session of the Central Discipline Inspection Commission held in the spring of 1981 pointed out: Since the founding of the PRC, in our party "we have on the one hand certain veteran cadres who have been through rigorous tests during the revolutionary war and under the reign of White terror and certain advanced elements on various fronts who have joined the party after the victory of the revolution. After becoming 'officials,' they are fond of flattery and cannot be criticized. They become complacent and lethargic and gradually show no concern for the sufferings of the masses. They allow themselves to be covered with the dirt of bureaucratism, become arrogant, conservative, lazy and greedy for creature comforts and develop a 'special privilege' mentality. A handful of them cannot withstand the 'suger-coated' bullets of various shapes and forms in society, mainly the influence of feudal ideas and the corrosive influence of moribund bourgeois ideas, and they change from public servants of the people into overlords sitting on the backs of the people or become mediocre people without revolutionary enthusiasm and with no sense of political responsibility and think only in terms of personal advantages. On the other hand, there are many people whose motives are not pure. Because they see that by joining the party in power they no longer have to take rigorous tests or risks but will be trusted and given responsible posts, they therefore use every means to worm their way into the party to scramble for power and profit."

Actually, we do not want these nominal party members even as a gift. Unfortunately, this kind of people have already wormed their way into the party. When joining the party, these people also verbally vowed that they would dedicate themselves to the struggle for achieving the lofty ideals of communism. In reality, they have a "small abacus" in their hearts. What they mainly want is to use the title of a member of the ruling party and take advantage of the status of the ruling party to reap as much profit as possible. Moreover, they are neither prepared nor have any intention of really discharging their responsibilities or making contributions to the cause of the party and people. Some of them even have ulterior motives and are bona fide speculators and careerists. How can we expect such unqualified or questionable party members to display strong party spirit or good party work style?! The large number of such people in the party will more easily give rise to problems in party work style. All this has obviously become even more conspicuous as a result of the new conditions and problems appearing in the building of the ruling party after the 10 years of internal disorder of the "Great Cultural Revolution."

Second, the question of the ruling party's work style needs to be particularly stressed also because, under the new historical circumstances, this question is easily overlooked by party organizations at all levels and by comrades in the party.

Meng Ke of the Warring States Period, in the book "Mencius," said: "Without enemy states and foreign aggressions, a nation will perish." Ouyang Xiu of the Song Dynasty, in "Preface to Lingguan Zhuan," a history of five generations, said: "Worries and labor can contribute to the rise of a nation, leisure and overindulgence will lead to ruin." The historical lessons summed up by the ancient people are quite true, and they also deserve to be used as object lessons by our Communist Party and our socialist state.

Since the founding of the People's Republic, although enemy countries and foreign countries still exist, the threat of this kind of external pressure to the survival of our country is no longer as pressing as during the revolutionary war years. Under the condition of the peaceful and stable environment and as the ruling party, the quality of the ties between the party and the masses no longer has such a direct bearing on the prosperity and decline and the ups and downs of our party as during the revolutionary war years. Large numbers of troops, who lived scattered among civilian houses, have now moved to centralized camps. Large numbers of comrades have shifted from the countryside to the cities and large numbers of cadres have been transferred from the basic levels to leadership organs. Naturally, their ties with the people are no longer as close as in the past. After a while, the concept of the enemy's situation and the mass viewpoint of many of the comrades in the party soon begin to weaken and arrogance, complacency, bureaucracy and apathy begin to develop. At the same time, everyone soon forgets and no longer pays attention to the question of how to preserve the fine traditions of the party and improve the party work style. They often cannot coordinate holding themselves responsible to the leadership organ and holding themselves responsible to the people. We must also see that regardless of whether in internal affairs or foreign affairs, our work has become increasingly difficult. To begin with, the leadership of the party should be political leadership. However, for the sake of convenience, much of the work which should be carried out by the government is often directly taken over by party organizations. Consequently, there is no distinction between the party and the government and the party no longer runs the party. In other words, the bulk of the energy of party organizations is tied up in administrative work and the building of the party itself is slackened off instead. Under this kind of situation, it is naturally very easy to neglect the question of improving party work style.

Third, the reason we must place special emphasis on the importance of improving the party work style of the ruling party is also because whether or not the Communist Party will degenerate and collapse after coming into power is no longer an abstract theoretical question, but the danger really exists in actual struggle.

What our party has been through is sufficient to explain that if the ruling party neglects and slackens off the building and rectification of the party itself for any length of time, or even if it attaches importance to and firmly grasps the work, but cannot accurately diagnose the "symptoms" or write out a correct "prescription" because of the domination and influence of "leftist" ideas, the consequences will be disastrous. Under these two kinds of conditions, the quality of the whole party will further deteriorate, and correspondingly, party spirit will certainly become more and more impure and party work style will certainly become more and more unhealthy. If this situation continues, it will provide suitable soil or climate for the conspirators and careerists in hiding to unite and form themselves into a reactionary force, and they will take advantage of the opportunity to carry out activities to usurp party leadership. In this way, there will be the danger of the party being undermined and usurped and this will lead to degeneration and changing color. It would be well for everyone to think of the past:

During the "Great Cultural Revolution" the Lin Biao-Jiang Qing counterrevolutionary cliques took advantage of the mistakes of the party to arrogantly go on a rampage and wreak havoc. They turned the whole party and the whole country into a mess. In those years signs of danger appeared everywhere and there was a danger of the party degenerating and the country changing its color. Are these facts not vividly displayed before the comrades of the whole party and the people of the whole country?!

In conclusion, it is definitely very easy for the work style of the ruling party to have problems. It is definitely also very easy for the ruling party to neglect party work style. If the ruling party is not well run, there is definitely the danger of becoming estranged from the masses, being sabotaged by conspirators and careerists and also degenerating and changing color. To always preserve the quality of our party as the vanguard of the proletariat and always maintain blood ties between our party and the broadest masses of people, we must improve party work style.

The Current Situation of Party Work Style

In the beginning of 1981, it was pointed out in the "summary of the third forum convened by the Central Discipline Inspection Commission on implementing the 'guiding principles'" which had been approved by the CCP Central Committee that: "Since the smashing of the 'gang of four,' and particularly since the 3d Plenary Session of the 11th CCP Central Committee, and with the hard efforts of the party, there has been a considerable improvement in our party's work style." "However, generally speaking, there has not been a fundamental change for the better in our party work style when compared with the early years since the founding of the party. In many places and departments, the unsavory trends practiced by the party members and cadres have become very serious questions." One year has passed now since this was published. Our party work style at present has been greatly improved compared with 1 year ago. Despite a varying speed of improvement on all fronts and in all aspects, the general situation is promising and the prospects are bright.

Speaking from the point of view of the CCP Central Committee, since the 3d Plenary Session of the 11th CCP Central Committee and in view of the principle that within our party's highest leadership nucleus, party spirit decides party work style and the latter is the manifestation of the former, party spirit has been strengthened and the party work style has fundamentally changed for the better. We have strong grounds to support such a saying.

For instance, since the third plenary session, our party has redressed a large number of unjust, false and wrong cases in the manner of seeking truth from facts and has seriously implemented the party's cadre policy, giving a large group of proletarian revolutionaries who have undergone repeated tests and good cadres who are loyal to the party's cause a chance to work for the party again. Under such a premise, the question of collective succession of the leadership nucleus of the CCP Central Committee in carrying forward the revolutionary cause pioneered by our predecessors and forging ahead into the future is completely solved. Can the CCP Central Committee do this if it does not possess the principles of being selfless, proceeding with everything from the interests of the revolution and wholeheartedly serving the people and the resulting fine party work style?

For instance, the sixth plenary session has adopted a practical and convincing resolution which is full of the spirit of self-criticism regarding several questions in the history of the party since the founding of the state. These questions include complicated ones such as the "Great Cultural Revolution," particularly some major questions such as the historical role of Comrade Mao Zedong and how to correctly understand and view Mao Zedong Thought. Can the CCP Central Committee do this if it does not possess the party principles of Marxist dialectical materialism and historical materialism and the resulting fine work style?

For instance, since the third plenary session, the CCP Central Committee has been leading the whole party in turning chaos into order in various fields and has formulated a complete set of correct line, principles and policies in order to liven up the political sphere, the economic sphere and the ideological sphere and to advance and win victories under the guidance of the four basic principles. Comrade Zhao Ziyang gave an encouraging report on this at the Fourth Session of the Fifth NPC. Can the CCP Central Committee do this if it does not possess the party principle of upholding the socialist road and the communist ideals and the resulting fine party work style?

For instance, since the third plenary session, the CCP Central Committee has been continuously calling for upholding party discipline and promoting party work style, and for this very reason, it has decided and has officially restored the discipline inspection committees at all levels, formulated and adopted the "Several Guiding Principles on Inner-Party Political Life" and several regulations on the livelihood and treatment of high-level cadres. In addition, the CCP Central Committee has taken the lead in upholding democratic centralism, upholding collective leadership and upholding the launching of criticism and self-criticism in the political life inside the CCP Central Committee. As far as leading work is concerned, it has taken the lead in going deep into reality, going deep among the masses, carrying out investigations, seeking truth from facts, opposing bureaucratism and opposing lies, exaggerations and empty words. As far as everyday life is concerned, the CCP Central Committee has advocated hard work and plain living, opposed practicing extravagance and waste and seeking personal privileges, striving to improve as soon as possible the party work style which has been totally ruined in the 10 years of upheaval by the Lin Biao and Jiang Qing counterrevolutionary cliques and striving to restore as soon as possible the fine traditions of the party. Can the CCP Central Committee do all this if it does not possess the intrinsic essence of communism and the resulting fine party work style, and consequently be bold in upholding the truth for the people's interests and correcting mistakes?

For instance, news of victory has kept pouring into the rural areas over the last few years. The 800 million peasants, who suffered during the 10 years of upheaval and under the guidance of the erroneous "left" agricultural policies, are content now, singing the praises of the CCP and socialism. What accounts for this change? It is because, since the third plenary session, the CCP Central Committee has been proceeding from our national condition, rationally readjusting the agricultural policies and vigorously pushing forward the agricultural production responsibility system. Consequently, the whole rural economy has been enlivened, giving the peasants something to strive for and gradually enriching them. Can the CCP Central Committee do this if it does not possess the party principle of seeking truth from facts and following the mass line and the resulting fine party work style?

During his lifetime, Comrade Mao Zedong put forth a tentative idea of "creating a political situation which has both centralism and democracy, discipline and freedom, unified will and individual ease of mind and liveliness and vigor." This wish has fundamentally been realized in the CCP Central Committee since the third plenary session. Our CCP Central Committee has actually taken the lead in enhancing party spirit and correcting party work style. It has set a very good example for the whole party. As a veteran party member, I am elated by the strong party spirit and fine party work style which have been realized by our CCP Central Committee since the 3d Plenary Session of the 11th CCP Central Committee, and I am confident that the whole party's work style will be improved under the leadership of the CCP Central Committee.

The promising situation of strengthened party spirit and improved party work style has been clearly manifested and reflected in various aspects in many places and departments throughout the country.

For instance, since the CCP Central Committee reiterated the party discipline and urged the whole party to keep political unanimity with the CCP Central Committee, the situation has been improved among the party organizations at all levels and party members who went their own way, feigned compliance and openly boycotted the decisions and policies of the CCP Central Committee. Regarding the implementation of the party's line, principles and policies, although there still has not been strict enforcement of orders and prohibitions, the situation is much better than it was 2 years ago.

For instance, since the CCP Central Committee published the "Resolution on Several Questions in the History of Our Party Since the Founding of the PRC" adopted at the sixth plenary session, conducted the forum on questions on the ideological front, reiterated the four basic principles and further expounded on the party's "double-hundred" policy, the ideological confusion inside the party has fundamentally been cleared up and the arrogance of bourgeois liberalization and extreme democratization has obviously been weakened.

For instance, since the Central Discipline Inspection Commission worked in compliance with the instructions of the Central Committee, worked in coordination with other departments concerned, and strengthened struggles against unsavory trends and deeds in violation of law and discipline in the economic realm, it has seriously investigated and dealt with typical cases, vigorously commended good people and good deeds and severely dealt with bad people and vicious deeds. Thus, the unsavory trends in the economic realm which had aroused discontent among the people have disappeared to a varying degree. Being condemned by public opinion both inside and outside the party, departmental selfishness which does not take the interest of the state into consideration and is only concerned with the interest of the unit itself and the trend of practicing extravagance, has changed. Criminals inside the party who ganged up with bad social elements, engaged in speculative activities, practiced corruption and theft, engaged in smuggling activities, accepted bribes and seized state property have been taught a lesson by the party discipline and state law.

Another example is that in the course of further implementing the "guiding principles," party organizations at all levels have generally restored the system of inner-party life. Integrating study of the central documents, CCP committees of the various departments and various state organs, and CCP committees of all provinces, municipalities and autonomous regions have generally conducted party group and party committee meetings on life. Many places have improved the system of democratic centralism and established the system of collective work, bringing about obvious changes in some places where the patriarchal system and the practice that one person alone has the say existed for a very long period of time. Particularly, since the Central Committee issued instructions to all areas and departments on overcoming weakness and laxness in leadership and vigorously strengthening ideological and political work, the mental state and leadership work style of many leading cadres have been improved to a great extent. Grasping ideological and political work cannot be separated from grasping party work style. In order to improve the state of weakness and laxness, we must straighten our backs to carry out struggles against the unsavory trends. Many heads of party committees and party groups have personally listened to reports on discipline inspection work, personally made arrangements for carrying out large-scale inspection against unsavory trends and personally approved handling of serious discipline violation cases. They have taken the lead in thoroughly grasping work, starting with themselves and extending work from this point to all areas. There have been good examples of grasping party work style at provincial, prefectural and county levels in many areas.

Another example is that since the CCP Central Committee published the decision on two agricultural problems, the whole rural economy has been livened up and various forms of the production responsibility system have been implemented. In many places, party work style and the relationship between the party and the masses at the grassroots have been improved to various degrees.

Not long ago, Comrade Deng Xiaoping said: We have made a judgment that the current political situation of the party and the state is the best since the 1960's. Comrade Zhao Ziyang pointed out in his report delivered at the Fourth Session of the Fifth NPC that the whole economy at present has turned out to be better than we had anticipated. We should like to ask: Is it possible that such a good political and economic situation appeared without there being a great improvement in our party work style? Therefore, speaking from the viewpoint of the party and the state as a whole, we have already put an end to the dangerous situation created as a result of the 10 years of upheaval, in which individualism, anarchism, and extreme democratization ran rampant, in which factionalism took the place of party spirit, and in which the healthy atmosphere was not expanded, unhealthy trends ran rampant, evildoers were in power and good people suffered. We have led the party and the country onto a normal and healthy road of development.

However, we must not let success go to our heads and must soberly realize that unsavory trends are still commonly found inside the party. Unsavory trends are found in all departments and all areas to varying degrees, and the situation is grave in certain departments. Serious cases occur constantly. All this shows that there has not been a fundamental turn for the better in party work style. Although some unsavory trends have been checked today, they may manifest themselves again tomorrow. Although some have been checked in certain places, they may gain ground in other places. We must make still greater efforts in correcting party work style and must not slacken our efforts in carrying out resolute struggle against various sorts of unsavory trends inside the party in order to restore our party work style to the level of that after the Yanan rectification or in the early years after the founding of the country. We must enable our party work style to serve as a strong guarantee, play an active role in fulfilling our task of realizing the four modernizations, build a high degree of material and spiritual civilization and not become obstacles.

At present, what are the serious unsavory trends inside the party which merit our closest attention and should be vigorously corrected?

As far as the political and ideological realm is concerned, the problem of maintaining political unanimity with the CCP Central Committee cannot be said to have been solved in all levels. The letters from the masses and the cases of appeals and accusations of the party members in some departments and places show that a small number of cadres including leading cadres still feign compliance with the party Central Committee's line, principles and policies but stick to their old way of doing things. They always delay implementation of policies which should be promptly implemented and refuse to redress unjust, false and wrong cases which should be redressed. Seen from the ideological front, it cannot be said that everyone has accepted the four basic principles. A small number of party members still have the erroneous thinking of shaking off party leadership, shaking off the socialist road and promoting bourgeois liberalization. It will be impossible for these party members to talk about party spirit if they persist with their erroneous thinking and refuse to correct it.

As far as social and economic life is concerned, unsavory trends which are commonly found include making use of connections, doing things through the back door, giving banquets and presents, practicing extravagance and waste, benefiting oneself at the expense of the public by means of one's own authority, promoting departmental selfishness, seeking personal privileges for oneself, dependents, and relatives and so on. Many of these unsavory trends were first practiced by party members and cadres. Some leading cadres not only turned a blind eye to all these but even ganged up with these people, not feeling ashamed and thinking themselves clever. Proceeding from promoting unsavory trends, some party members and cadres gradually supported, tolerated, sheltered or even took part in illegal activities such as corruption, theft, speculation, smuggling, tax evasion and so on. Being corrupted by foreign bourgeois thinking and way of life, some party members and cadres have lost national self-respect and they worship and have blind faith in things foreign. Even more, they try to seek benefits for themselves from foreigners at the expense of national pride and their own integrity.

In party and national political life and in economic management, bureaucracy is also commonly found. This has become a major obstacle in the course of taking the new road of national economy and building the four modernizations. Administrative work style and party work style are basically the same thing, and unsavory administrative work style is the consequence of unsavory party work style. In his government work report, delivered at the Fourth Session of the Fifth NPC, Comrade Zhao Ziyang put forth that it is necessary to "resolutely change the unbearable situation in which there is a great number of departments and overstaffed organizations, in which the administrative structure is complicated, in which departments argue back and forth over trifles, in which there are more hands than needed and there is an excessive number of deputy posts and empty posts and in which efficiency of work is low." At the same time as we are vigorously simplifying organizations, it is demanded that leading cadres of state organs constantly go deep into the realities of life, go deep among the masses, carry out investigations and go to the lower levels and grassroots to solve practical problems. "We must resolutely correct the bad practices of shifting responsibility onto each other, being dilatory in doing things and being irresponsible in work and resolutely get rid of the 'yamen' work style of being enthusiastic in passing around official documents and correspondence but not in solving practical problems."

Why has there not been a fundamental turn for the better in our party's work style even up to now? There are many factors accounting for this and the major ones are as follows:

1. The 10 years of upheaval have seriously ruined the party's body and corrupted the party's traditions and work style, exerting deep and wide pernicious influence on the people. All these wounds cannot be healed in a short time. When we recall that it took our party 10 years from the Zunyi meeting to the seventh party congress to fundamentally exterminate the pernicious influence of leftist adventurism, it is not hard for us to imagine how tough the task is to exterminate the "sequelae" of the "Great Cultural Revolution."

2. Over the last few years, many party organizations and leading party cadres have not paid serious attention to grasping education in the party spirit. They always separated party work style from party spirit and grasped party work style merely for the sake of grasping party work style. They did not exert sufficient guidance or support in the course of struggling against various unsavory trends inside the party, only relying on a small number of people who worked off and on and were unable to concentrate all forces to work at one stroke. Neither have they made good use of the masses' supervision or press criticism to build up momentum. Grasping party work style

in such a way can only get half the result with twice the effort, wasting energy and having very little effect.

3. From the upper levels to the lower levels, the questions of mixing party and government work and the party not minding its own affairs have not been solved in actual practice, despite the CCP Central Committee's repeated demands to find solutions for them. Up until now, a considerable number of party organizations of various departments and areas have not paid serious attention to grasping party work style and education in the party spirit and have ignored ideological and political work. As soon as they immersed themselves in production and business, they turned a blind eye and a deaf ear to the unsavory trends. They could not exercise strong and powerful leadership or display combat effectiveness. In many cases, severe unsavory trends existed in the leadership groups themselves. Therefore, they could not improve organizational life or carry out positive ideological struggles in accordance with the party's organizational principles and even dreaded criticism and self-criticism in the same way as people dread tigers. Grasping party work style faces more obstacles in places where the following "three kinds of persons" still occupy leadership posts: those who gained ground by following Lin Biao and the "gang of four," those who are seriously affected by factionalism, and those who beat, smash and loot.

4. There has been no party rectification for a number of years and the problem of the impurity of the party ranks and organizations has not been solved. It was mentioned above that some party members inside the ruling party might have degenerated and that it was unavoidable that certain speculative and ambitious members were admitted as party members. All this brought about the impurity of the party organizations. The party ranks were expanded by 100 percent amid the chaos during the 10 years of the "Great Cultural Revolution," and it is true that some of the party members were basically not qualified. This aggravated the situation of impurity of the party organizations. In January 1980, in the report entitled "The Current Situation and Tasks," Comrade Deng Xiaoping said: "At present, some party members are unqualified. Those new party members who joined the party when it was under the rule of the ultraleftist line had never received any party education. They cannot set examples for the masses and thus are unqualified. Some of our veteran party members have been qualified party members for a long time in the past. However, they have become unqualified now because they also are unable to set examples for the masses. We advocate party spirit and oppose factionalism. However, some people can never discard factionalism. A large number of people, including our veteran party members, have a higher sense of factionalism than of party spirit. How can these people be qualified?" Those unqualified party members inside the party have not established a revolutionary world outlook and have no communist ideals. The minds of some of them are filled with individualism and they even treat the distorted theories of "one's authority will become invalid if one does not make good use of it," "with power, one has everything" and so on as truth. How can they talk about party spirit? And how can they display good party work style?

5. Party discipline has not been strictly enforced. At present, unsavory trends involve political, economic, cultural and other fields. However, over

the last few years, there were many obstacles in the course of correcting unsavory trends and party discipline was not strictly enforced. Punishments have been too lenient and perfunctory; those who should have been punished were not punished at all or were just lightly punished. Thus, punishments have not played the role of rescuing the individual and educating the majority of the people.

How To Bring About a Fundamental Change for the Better in the Party's Work Style

Over the past year or so, while affirming on many occasions obvious signs of improvement in the party's work style, Comrade Hu Yaobang has pointed out that a fundamental change for the better in the party's work style has yet to be achieved. He has suggested that a decisive turn for the better in the party's work style be achieved this year. The No 21 issue of RED FLAG in 1981 specially carried "Comrade Deng Xiaoping's Talks on Rectifying the Party's Work Style" and also an article by its editorial department entitled "Fight for a Fundamental Change for the Better in the Party's Work Style." As for how to achieve a fundamental change for the better in the party's work style, I think that the following several points must be further stressed:

1. We must pay close attention to education in party spirit and intensified training in party spirit.

In order to achieve a fundamental change for the better in the party's work style, a decisive part is the vigorous continuous conducting of partywide education in party spirit so that every party member can consciously strengthen his training in party spirit. On this basis, we must continue to firmly implement the "Guiding Principles on Inner-Party Life" and more resolutely fight various unhealthy and evil practices within the party. Taking good care of education and training in party spirit is a fundamental guarantee for the proper rectification of the party's work style. Establishing a proper work style will in turn stimulate the strengthening of party spirit.

The main contents of the program for education in party spirit should include: Education in Marxism-Leninism-Mao Zedong Thought; education in party regulations and guiding principles on inner-party political life; and education in the party's fine traditions and work style. At present, strengthening education in party spirit is a matter of urgency. I suggest that some concrete measures be adopted in a down-to-earth manner.

The discipline inspection commissions and organizations and propaganda departments at the central, provincial, municipal and autonomous region levels must join forces to work out, as soon as possible, teaching materials aimed at strengthening education in party spirit--materials to be handed over to the lower-level party organizations for reference and to party members for reading or study.

Our party has said much about party spirit, as can be found in some documents of and appeals by the party Central Committee over the past many years and the speeches and articles of the leading comrades of the party Central Committee. Since the 3d Plenary Session of the 11th CCP Central Committee, the party Central Committee has also stressed and reaffirmed many points. For example, as far as the ideological line is concerned, we have reaffirmed practice as the only criterion of truth and opposed the philosophy of "two whatevers." Politically, we have reaffirmed the four basic principles and opposed bourgeois liberalization and ultrademocracy. In regard to inner-party political life, we have reaffirmed guiding principles for the actions of the party, have upheld party spirit and opposed factionalism and have supported the party's fine traditions and fought various unhealthy practices. In actual work, we have stressed that we must be down-to-earth, concretely analyze problems, do everything with reality in mind, uphold the principle of "no right to speak without having made an investigation," and oppose subjectivism, bureaucratism, factionalism, decentralism, and so forth. That portion of the 6th Plenary Session of the 11th CCP Central Committee's "Resolution on Certain Problems in the History of Our Party Since the Founding of the PRC" on Mao Zedong Thought, reaffirmed in a concentrated form some correct viewpoints and suggestions by Comrade Mao Zedong on the building of the party. Many slogans reflecting the principles of party spirit, such as "utter devotion to others without any thought of self," "fear neither hardships nor death," "be the first to march forward and the last to retreat," "be the first to suffer and the last to enjoy comforts," "the foolish old man who removed the mountains," "serve the public selflessly," "learn from Comrade Lei Feng," "party members must play an exemplary role and party branches must play the role of a bastion," and so forth, seemed for a time to have gone out of fashion. Some of these slogans were even criticized in newspapers and magazines as wrong. Now they have again been affirmed and advocated. All these principles, demands and slogans translated into the actions of party organizations and party members represent the fine party work style. Are they not very good teaching material on party spirit if properly compiled, expounded and developed?!

Party schools at all levels should attach importance to education in party spirit and should not one-sidedly raise the theoretical level without regard to education in party spirit.

Party newspapers and magazines at all levels should attach importance to publicizing problems of party spirit and party work style. They must take the trouble to publish some theoretical articles on party spirit and party work style. They must always act in cooperation with the discipline inspection departments reporting typical cases and openly praising or criticizing them. They must conduct publicity in a big way to inspire and arouse people. They must stimulate the effort of various quarters to fight unhealthy trends.

As bastions in the forefront of work and production, basic-level party organizations should become regular classrooms for conducting education and training in party spirit. We must regularly call party branch general meetings, party branch meetings and party group meetings and regularly give party lessons to party members and prospective members. These efforts, known in brief as "three meetings and one class," must be properly handled. But we cannot just talk nonsense or mechanically pass on what is being publicized.

Instead, we should take the actual conditions of party members into consideration and conduct education with targets in mind. Through education in party spirit, we must enable party members to continuously strengthen the concept of the party, to consciously carry on the party's fine traditions, to put party interests above everything else and to better fulfill party assignments.

In a word, the party at all levels must in all fields tackle the problem of strengthening party spirit as a major issue in building up the party and as a major theme in strengthening the building of the party ideologically. The job must be done well in a serious manner.

Comrade Mao Zedong said: "There are many party members who have joined the Communist Party organizationally but have not yet joined the party wholly or at all ideologically. Those who have not joined the party ideologically still carry a great deal of the muck of the exploiting classes in their head and have no idea at all of what proletarian ideology, or communism, or the party is. 'Is proletarian ideology not the same old stuff?' they ask. Little do they know that it is no easy matter to acquire this 'stuff.' Some will never have the slightest communist flavor about them as long as they live and can only end up by leaving the party." ("Selected Works of Mao Zedong," Vol 3, p 832) In judging whether a party member has joined the party ideologically and whether he is qualified as such, we must chiefly check to see whether he is imbued with party spirit and how strong his party spirit is. In training a prospective party member, we must pay primary attention to his training in party spirit, apart from giving him a fundamental knowledge of the party. Only after he acquires a certain degree of party spirit can he be admitted to the party. After joining the party, he must continuously strengthen party spirit and give expression to party spirit in his words and deeds at all times, embracing a fine party style. Every party member must have a sense of honor or guilt where the degree of party spirit is concerned. Within our party, we should create a trend where everyone equates party spirit with honor and lack of it with shame.

How should our comrades make a start in strengthening training in party spirit in order to acquire the spirit of the Communist Party and become a good party member who is imbued with party spirit and is worthy of the name? Comrade Li Shaoqi's "How To Be a Good Communist" is very good teaching material for strengthening training in party spirit. We should seriously read it and follow what is said. Every Communist Party member who makes it his ambition to fight for communism throughout his life must continuously transform himself in practice. He must distinguish between communist ideas and individualist ideas, between proletarian ideas and all nonproletarian ideas, between materialism and idealism and between dialectics and metaphysics. He must correctly handle the relations between party interests and individual interests, gradually cultivate a communist world outlook and relevant methodology, solve the problem of joining the party ideologically and make himself a really qualified Communist Party member. Now we must build socialist spiritual civilization. For a Communist Party member, being mindful of party spirit and acting according to the principles of party spirit is an embodiment of a high degree of spiritual civilization.

2. We must purify the ranks of the party and perfect the life of the whole party.

In order to purify the ranks we must do an organizational overhaul. The impurity of the party ranks is a realistic problem confronting us and is one of the main reasons why our party work style has so far not basically taken a turn for the better. Therefore, in their speeches in the past 1 or 2 years, Comrade Deng Xiaoping and Comrade Hu Yaobang have time and again pointed out: There is now really a problem of reorganization confronting our party.

At present, we must first properly reorganize various leading groups. In recent years, our party has done much work in this respect. But the problem has still not been completely solved. This is a very complicated and unusually important problem. It concerns the party's organizational line. Continuous and serious efforts should be made toward its proper solution. We must resolutely get rid of those who made a start by joining Lin Biao and the "gang of four" in rebellion, those seriously affected by factionalist ideas and those given to beating, smashing and looting--people who still exist in the leading groups. In no way can we show compassion and leave them alone so that they constitute a potential threat to the party. We must also remove from leadership posts those who obstinately resist and oppose the party's line and general and specific policies introduced since the third plenary session, those who take the lead in promoting unhealthy practices and even act against the law and those who are unamenable to reason and incorrigible. We must resolutely rid the party of those who have made serious mistakes and have become completely disqualified as party members.

Second, we must rely on those leading groups which have already been purified to further overhaul party organizations and purify the ranks. We must take effective measures to make a clean sweep of speculators who have wormed their way into the party to pursue their own ends and those careerists given to making trouble and carrying out sabotage. Coping with this matter is a long process. We must at all times combine our efforts with various tasks and show not the least slackening of effort in taking care of every one of these undesirable persons and in getting rid of all who are discovered. According to the standards for party members, the abovementioned several kinds of people of course do not qualify for membership. But we cannot hold the sweeping view that those party members do not qualify as such are beyond help. Therefore, in overhauling organizations, we must guard against putting things in simplified terms. All those Communist Party members who can be saved after being educated must be subjected to patient and conscientious education and be saved and transformed. Otherwise, we are very likely to make serious mistakes. Another point worth noting is that we cannot complete the purification of the party ranks at one stroke. We must not only work at it at present but also do so in the days to come. We must treat it as a long-term task in the organizational building of the party.

Apart from organizational consolidation, we must give a lot of attention to the rectification of thinking and the rectification of the work style. In solving the latter two problems, we must chiefly rely upon the whole party to further implement the "guiding principles" and other relevant central documents. Everyone from party committees and organizations at all levels to basic-level party branches must strive to improve organizational life and to seriously unfold criticism and self-criticism. Now some areas and departments are plagued by unhealthy trends. In several speeches in 1981, Comrade Hu Yaobang pointed out that those who supported the central line were isolated, those who worked energetically were isolated, and those who spoke the truth and upheld justice were isolated. Some people made a point of criticizing and finding fault with those relatively active comrades. This actually discouraged what was right and proper and dampened the revolutionary enthusiasm of the masses of party members. This trend must be reversed. Our party member cadres cannot neglect their party spirit and go with the tide, doing as others do and playing the role of "good old me." Instead, they should make a clear distinction between right and wrong where principle is concerned and dare to uphold what is right and proper and to wage a resolute struggle against those unhealthy and evil practices. They must strictly enforce party discipline concerning some people who perform poorly ideologically and who make a practice of defying law and discipline. Party organizations at all levels must strive to overcome the state of laxity and weakness, so that we can get well organized and be well guided in our work style and can distinguish between right and wrong, between merits and demerits and between what should be penalized and what should be rewarded, making the party branch a really strong bastion.

3. The whole party must get involved in taking comprehensive measures and vigorously rectifying party work style.

The party work style permeates and finds expression in the whole party's political life and various tasks and party members' words and deeds. Rectifying the party work style is the task of the whole party and also the duty of party organizations at all levels and the whole body of party members. As adjuncts to party committees in rectifying the party work style, discipline inspection commissions at all levels, in particular, cannot shirk the responsibility. Some comrades have shifted this important issue completely on to discipline inspection committees and party committees, doing nothing and even taking it as an extra burden. This is a very wrong idea. Experience in several years fully shows that only by getting the whole party involved, taking comprehensive measures, linking up efforts at all levels and going whole hog can we basically bring about a turn for the better in the party style.

First, party committees at all levels must realistically strengthen leadership. In rectifying unhealthy trends, the most important point is to start with the leadership, set examples at every level and have one level take care of another. Facts tell us that where the party committee of an area of department has directed intensified efforts toward this job and exercised effective leadership, the party style changes quickly for the better. The stimulating effect of a turn for the better in the party work style on vocational matters and on production and construction is also very obvious. Conversely, where the party committee of an area or department has treated the problem of party work style lightly and is weak in its leadership, unhealthy practices inevitably remain very common and pervasive, making it difficult to achieve remarkable results in vocational and production fields. We hope that those areas that have achieved something in this respect should strive for still greater progress. Those areas which for a time failed to exert themselves seriously should also strive to learn from others' useful experiences and lose no time catching up. Comrade Yang Yichen, first secretary of the Heilongjiang provincial party committee, said: "If the party work style is not properly taken care of in Heilongjiang Province, we of the provincial party committee must hold ourselves responsible. I, for my part, must bear the greater part of the responsibility. If the party work style is not properly taken care of in various prefectures and municipalities, the prefectural and municipal party committees must be held responsible and the principal men must be made to answer for it." I set great value on what he said. If leading groups at all levels and the principal men of party committees, in particular, display such spirit and courage in handling the party work style, is there still any need to worry about not properly rectifying the party work style?

Second, discipline inspection departments, organizational departments and propaganda departments of the party are the three main active departments helping party committees in taking charge of party building. These three departments assume important responsibilities in organizational and ideological fields and in how to develop a proper party style in work, life and other respects. Therefore, the discipline inspection, organizational and propaganda departments of the party must act in cooperation in their routine work, sharing tasks and taking unified steps. They must also make well coordinated arrangements and take concerted actions concerning how to help party committees in properly handling the matter of strengthening party spirit and basically bringing about a turn for the better in the party's work style.

Third, various specialized departments, enterprises and units serving the people in such fields as the national economy, culture, education, science and technology must, on the one hand, keep busy with business matters and, on the other, take care of party spirit and party work style. Generally speaking, many departments connected with business matters perform relatively well in "paying simultaneous attention to the two fields." But the situation of the party committee of a department stressing business and production to the neglect of ideological and political work and paying no or scant attention to unhealthy party practices is also rather common. Such a trend must be realistically reversed.

Fourth, we must realistically promote democracy and safeguard the democratic rights vested in party members by the party constitution and the power vested by the state's constitution in the people to be masters of their own house. The aim is to enable party organizations at all levels and leading party cadres at all levels, in particular, to receive supervision from the party and the masses. To consciously strengthen their training in party spirit, our comrades should not be afraid of supervision and criticism by lower levels and by the masses. They should instead actively create conditions and arouse and welcome all comrades, friends and people who show loyalty to the party and love for the party inside and outside the party to strengthen supervision over themselves, to criticize our shortcomings and mistakes at any time and to help us rectify unhealthy practices. The kind of attitude adopted toward supervision and criticism from inside and outside the party is in itself a test of party spirit on the part of every one of our party members.

Fifth, party discipline inspection departments at all levels must strive to raise their ideological level and their professional level. In their work, they must keep summing up experiences and lessons and get deeply involved with the world of reality. The aim is to make investigation and study, get acquainted with new conditions and solve new problems. In helping the party committees to rectify the party style, they must have a clear idea of prevailing conditions, get properly oriented, cherish a great determination and follow correct methods, in order to achieve outstanding results.

To basically bring about a turn for the better in the party's style, the comrades of discipline inspection departments must get armed ideologically, enhance their sense of party spirit, arouse their spirits, and cherish a firm militant will. They must set great store by "courage," showing no fear for trouble, no fear for hardships, no fear for great obstacles, no fear for offending others and no fear for a vengeful counterattack and adhering to the principle of everyone being equal before party discipline and state laws. They must have the courage to fight all unhealthy trends and bad men and bad deeds. In the past, some comrades doing discipline work often confined the problem of party work style to the limits of a party member's life style and had a narrow outlook. Therefore, opposing the seeking of privileges in life was regarded as the sole aim of the effort to rectify the party work style. This represented a biased view. Should unhealthy practices in life be opposed? Of course, they should be. Should they be overcome? Of course, they should be. For a time, both the central and local authorities directed vigorous efforts toward this matter and achieved obvious progress. Such efforts should be continued. But judging by the situation as a whole, the whole party must at present especially focus attention and energy on overcoming unhealthy practices in the political, ideological and economic areas. In no way can we neglect or relax our struggle against the unhealthy practices in these fields.

At present, there are many favorable conditions when it comes to the rectification of party work style. The passive and pessimistic feeling of "a disease being incurable at its terminal stage" is unjustified. We should note that the party Central Committee has attached great importance to the rectification of party work style and cherished a great determination for that matter. Comrade Hu Yaobang urged the whole party to take up two important issues: the building of material civilization and the building of spiritual civilization. The rectification of party work style was also treated as an important part of the effort to build spiritual civilization. Recently, he again clearly stressed that in the new year, we must strive to bring about a decisive turn for the better in the party's work style. Under the impetus of the central appeals, the leading comrades of party committees at all levels and of various areas and departments have paid increasingly close attention to the problem of party work style concerning the ruling party. The great majority of comrades within the party and the masses of people have called on us to rectify the party work style as quickly as possible. Rectifying party work style is the common desire of the party and the people. A matter that has won such keen support from the masses of party members and people can surely be handled well.

AN IMPORTANT PRINCIPLE IN THE WORK OF CADRES

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 15-17

[Article by Commentator]

[Text] Setting strict demands on cadres and taking good care of cadres who have resigned or retired is an important principle of the party's cadre work. Some departments and units pay very little attention to this. They have not shown due respect and concern for cadres who have stepped back to the second and third lines but give much consideration to cadres on the frontline and do not set strict demands on the latter. This has reversed the order of importance.

The fundamental goal of our cadres is to wholeheartedly serve the people and hold ourselves responsible to the people. The reason why we must set strict demands on cadres, especially leading cadres on the frontline, is that they have directly shouldered the arduous task of organizing the masses in building the socialist economy and culture and their work has a most important bearing on the development of the entire socialist cause. At the very least it should be demanded that all leading cadres on the frontline conscientiously and effectively implement the line, principles and policies of the party and become models of political unity with the Central Committee. They should not, however, merely mechanically copy and relay instructions, and even less should they all go their own separate ways. In their leadership work they must stick to principle and should also give concrete guidance. They should be able to frequently examine the work of lower levels and offer prompt assistance to their subordinates to help them resolve difficulties in their work and should become models of a high degree of responsibility toward the socialist cause. However, they should not merely talk about things without taking any action, hemming and hawing whenever they face a decision or performing their duties in a perfunctory manner. They must not only work 8 hours each day but must also combine an enthusiastic spirit with scientific method. Working creatively they should become models of raising efficiency in work. They must not pass their time in a careless and sluggish manner. They must strictly follow the guiding principles for inner-party political life, and by refusing to use their official authority for personal gain and steadfastly opposing unhealthy trends they should become models of arduous struggling and honesty in performing official functions. They should never pose as "special citizens," making strict demands on others while being very lax themselves. In other words, they must be able to prove through their own practical actions that they are qualified leaders worthy of their position and authority. No matter what position a cadre is in, he should fully realize the necessity of setting strict demands on himself and conscientiously performing his duty in his position. The higher the position and the greater the authority of a cadre, the stricter the demands should be.

What should the examination of whether or not a cadre, particularly a leading cadre on the frontline, measures up to the above-mentioned conditions be based on? It should not be based on what he has said or how others have lavishly praised him but should be based on what he has done while performing his duty at his post and on what achievements he has scored that have been acclaimed by the masses. As far as the secretary of a county committee is concerned, if after 2 or 3 years' work, he has brought about remarkable changes in building the party and socialism in the county through his work and has won the support of the great majority of cadres and people, he has proved himself worthy of his post and is even a relatively fine secretary of the county CCP committee. On the contrary, if after several years of work he has made no contribution and nothing has really changed, and if even after he has been offered assistance he has neither attempted nor accomplished anything, causing the majority of cadres and people to become dissatisfied with him, then permission should be given for his resignation from office and the organization should reassign him to work more suited to his capabilities and political integrity. It should be like this for the secretary of a county committee and for other cadres as well.

For a long time, a certain view has been quite common among some comrades. It seems that once a cadre has been assigned to a post, he cannot be transferred to other posts even if he has made no achievements for a long time. If he has not violated any laws or regulations, whether or not he is earnestly working at his post or whether or not he is worthy of his post does not matter. Otherwise, the party organization will be asked to treat him according to the party's policy. This is a misunderstanding of the party's policy for cadres. It is incorrect and harmful. Only if we truly set strict demands on leading cadres at all levels can we spur them on to forge ahead, to raise their efficiency in work, to maintain and develop the party's fine work style and to resist corrosion of various nonproletarian ideas. Only in this way can we organizationally ensure the training of fine capable persons and the continuity of leading groups at all levels.

Stressing setting strict demands on cadres, particularly leading cadres on the frontline, does not at all mean that we need not consider their actual needs. The purpose of giving consideration to their actual needs is to provide them with conditions for serving the people better. At present, our country is not yet rich and we are carrying out economic readjustment. Even the people's livelihood can only be improved step by step. So matters concerning cadres' livelihood can only be tackled in order of priority. It is impossible to meet all the needs of cadres. We must also plainly tell cadres on the frontline that since they are entrusted with the important historical mission of carrying forward the revolutionary cause pioneered by our predecessors and forging ahead into the future, they should conscientiously share worries with the party, understand the country's difficulties and make up their minds to work harder and bear hardships in their daily life. If cadres can set an example in this respect, the masses will have greater faith in the four modernizations and their enthusiasm to realize the four modernizations will further be increased. We are sure that the great majority of cadres are eager to see that our country becomes strong and prosperous earlier and are aware of the great responsibility they have undertaken. They have acted or are acting in accordance with the strict demands set by the party and the people. However, there are also a few leading cadres on the frontline who do not work hard but incessantly scramble for special treatment or considerations of this kind or that. They even make use of their authority to seek special interests. We should not be overlenient toward them. On the contrary, we should uphold the principle of setting strict demands on them. Only in this way can we help them get the loads off their backs so that they can make further progress.

We should give due political respect to cadres who have stepped back to the second and third lines and fully meet their livelihood needs. Viewed from the current situation, many units have made much improvement in this respect but quite a few problems still exist. What is most worthy of attention is: As soon as some old comrades have stepped back from the frontline, they have to work in another office and no telephones are provided for them. They are no longer given the same treatment as when they were on the frontline in reading documents, listening to reports, using cars, consulting doctors, distributing houses, in cultural life and welfare in daily life. When they were at their posts, people offered help even when they had no difficulties. But after they have stepped back to the second and third line, their actual difficulties are not reasonably resolved and remain for a long time. They are sometimes given the cold shoulder. "When a cadre is at his post, human feelings exist. But once he has retired, human feelings disappear." This phenomenon is a reflection of the bad work style of "snobs" of the old society in the work of cadres. It runs completely counter to the principle of setting strict demands on cadres at their posts and taking good care of cadres who have stepped back from the frontline. An important reason why this situation exists is that some leading cadres or cadres in charge of this kind of work lack politics in their minds. They are not clear about the far-reaching significance of old comrades stepping back to the second and third lines. We should understand that old comrades who can no longer take up heavy work due to age and physical weakness have struggled for decades for the cause of the liberation of the Chinese people and for the cause of socialism. They have been the party's backbone and have rendered meritorious services to the country. Today, they are still an important political force in our party and country's life. Although they have stepped back from the frontline, they continue to play their parts as long as their health permits. This is an important measure to maintain the succession and continuity of the party's leadership and to ensure the long-term order and security of our country. Only after they have shaken off their heavy routine work can they devote their time and energy to considering the overall situation of socialist construction and put forth suggestions and methods for handling matters involving the fundamental interests of the party and the country and for solving important problems of respective localities and units. For example, old comrades regard discovering and training young cadres as a matter of utmost importance. This ensures that fine young cadres will be selected and tempered better and mature sooner with the help of old comrades. Since the 3d Plenary Session of the 11th CCP Central Committee, some old comrades of the Central Committee have stepped lack to the second and third lines. They not only have been able to play their roles as usual but even better. Therefore, as long as comrades on the frontline truly respect old comrades who have stepped back to the second and third lines, try hard to provide even more convenient conditions for them than for cadres on the frontline and pay great attention to their rest and health, they will then be able to play a role in the party's cause which other people can hardly play.

What is most important at present is that leading cadres on the frontline of all departments and at all levels, cadres of administrative departments of leading organs and cadres who are in charge of the work of old cadres must have a thorough understanding of the importance of work in this respect and should never regard it as routine work. The bad work style of "snobs" in the old society runs counter to the fine tradition of respecting the old and worthy Chinese people and conflicts with our party's principle of respecting and showing consideration for old comrades. If we tolerate the existence of this kind of thought and work style in the revolutionary ranks, we are indulging a bad work style to corrode and disintegrate our ranks, sabotage the party policy for cadres and harm the traditional bonds of friendship among revolutionary comrades. Only if we put forth the question in this solemn manner in order to warn comrades who are tainted with harmful thoughts and work style and if leading cadres set an example and regularly inspect and give guidance to departments concerned, will it be able to earnestly improve the work of giving due consideration to old comrades who have stepped back to the second and third lines.

In order to effectively implement the principle of setting strict demands on cadres at their posts and taking good care of cadres who have stepped back to the second and third lines, we must also take necessary practical measures. Organizationally, we must continue to properly reorganize leading groups of all departments and at all levels according to the requirements of "three-in-one" and the spirit of being capable and keen-witted so that they can truly become leading groups which can lead others in a charge and which have a high quality and efficiency of work. Institutionally, we must actively establish a strict and scientific system of personal responsibility and, on this basis, give regular and realistic examinations to cadres in the light of achievements made by respective cadres and using the method of combining appraisals made by the masses and assessments made by the organizations. As far as policy is concerned, we must resolutely protect and support comrades who uphold the party's principles and policies and dare to bring forth new ideas, comrades who work with all their might and comrades who uphold principles and are not afraid of giving offense. This will make it harder and harder for those cadres who have neglected their duty and are irresponsible. Besides, we must set strict demands on party life, rigorously enforce the party discipline and state laws and resolutely change the lax and weak situation in organizational work. As to those who have seriously failed to fulfill their duty, who are derelict in their duty or who make use of their authority to seek personal interests, we should appropriately deal with them in the light of each specific case by criticizing them, transferring them to other places, demoting them, recording a demerit or giving them the severest punishment according to party discipline and state law. There should be rules and regulations mapped out by organizations at higher levels concerning political and everyday treatment of cadres who have stepped back to the second and third lines. Concrete requirements should also be made in departments in various localities. A system in this respect should be formed. If the strength of work organs serving old cadres is insufficient or too weak, we must send more people to strengthen them. The system of personal responsibility should also be practiced in these work organs in order to ensure that each comrade is duly taken care of. We must uphold principles and at the same time be reasonable.

AN IMPORTANT QUESTION IN THE EMANCIPATION OF THE MIND

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 18-19

[Article in "Ideological Comment" column by Shi Jian [0670 6015]]

[Text] Basically speaking, emancipation of the mind is the use of Marxism-Leninism-Mao Zedong Thought to examine situations and solve problems so that the objective and the subjective become one and thinking and reality conform with each other, that is to say, seeking truth from facts. However, this is not an easy thing to do. This is because when people examine new situations and resolve new problems they are restricted not only by the development of objective matters and the level of expression of these objective matters, but also by their own position and capacity for knowledge. It is obviously impossible for someone having lofty communist ideals and someone who is shortsighted and selfish to have the same understanding of the conditions and the problems involved in the construction of the four modernizations. Therefore, in the course of emancipating the mind, one also encounters the problem of remolding the subjective world.

Is this to say that we are again raising the slogan "ideological reform"? Since the founding of the PRC, our party has followed the development of revolution and construction in upholding its unity with and the teaching of intellectuals. Since 1951, with the beginning of efforts to reform thinking, the party has also called on intellectuals to adopt the methods of criticism and self-criticism and to carry out self-education and self-reform. Under the guidance of the party's policies of unity, education and reform, vast numbers of intellectuals have made great advances in their thinking. However, the growth of leftist thinking led us to adopt various mistaken methods in our work to reform the thinking of intellectuals. Because this led to many abuses, harmed many comrades and created very unfavorable effects, many people now react against the slogan "reform of thinking." At the same time the broad masses of intellectuals have already become a part of the working class working to serve the socialist cause. The practice of raising the slogan of "ideological reform" is liable to reactivate the bias some people feel against intellectuals and could lead to the revival of such mistaken practices as discrimination, infighting and arbitrary criticism. This would hinder the implementation of the party's policy toward intellectuals and damage efforts to arouse the socialist enthusiasm of the intellectuals. For this reason the party's Central Committee has neither raised the slogan "ideological reform," nor planned to use the slogan against either friends outside the party or intellectuals. This is undoubtedly correct.

Since our party has not raised this slogan, does this mean that there is no need for the broad masses of party cadres and people, including intellectuals, to bother with ideological reform? This is not the case. The decision not to raise this slogan has been made on the basis of the lessons of historical experience, and the need to promote both unity and our work in no way suggests that a Marxist-Leninist can discard the principle that everyone must carry out conscious ideological reform. Comrade Mao Zedong emphasized that "the struggle of the proletariat and revolutionary people to reform the world includes the fulfillment of the following tasks: Reforming the objective world and, at the same time, their own subjective world--reforming their cognitive ability and reforming the relationship between the subjective and objective worlds." ("Selected Works of Mao Zedong," Vol 1, pp 272-273) Every one of us must steadfastly uphold this irrefutable truth of Marxism. During his lifetime, Comrade Zhou Enlai would often encourage others and urge himself on by using the phrase "live until you are old, study until you are old and reform yourself until you are old." This reveals to us an important principle: Only by continuously reforming one's subjective world in the course of understanding and reforming the objective world will one be able to unify the objective and subjective worlds. This reform of the subjective world refers to ideological reform.

In actual fact, the emancipation of the mind and ideological reform are intimately connected with each other. The call for the emancipation of the mind made by the 3d Plenary Session of the 11th CCP Central Committee means that we must free ourselves from the fetters of leftist errors committed before and during the "Great Cultural Revolution" and the restrictions of the "two whatevers" and that we should return to the scientific path of Marxism-Leninism-Mao Zedong Thought. It means that we must oppose idealism and uphold materialism, that we should manage affairs in accordance with the objective rules and use Marxism-Leninism-Mao Zedong Thought to examine conditions and solve problems. It means that we should liberate ourselves from the vestiges of feudalism and the influence of bourgeois thinking, shatter the force of habit and the fetters of subjective prejudice, and establish a true proletarian stand, viewpoint and method. The opposite of this is what we have called the ossification of thinking. Ossification of thinking reflects an ideological condition that is severely restricted by metaphysics. It means being unable to see the differences and connections between things and unable to distinguish the development and changes in things. Extreme solipsism is when this ossification of thinking develops to the point where one expects the whole of humanity to follow one's own individual ideas, wishes and will. If such ossification of thinking and solipsism are to be smashed, the mind must be emancipated; that is to say, thinking must be reformed. It is in this sense that emancipation of the mind and ideological reform are interlinked. The emancipation of the mind contains rather than excludes the idea of reforming the subjective world.

At the same time, however, emancipation of the mind demands only that we break out of old and erroneous restrictions. It in no way suggests that all restrictions, even correct ones, should be done away with and that we should be able to say and think whatever we like without any restriction whatsoever. The emancipation of the mind we are advocating must at all times be firmly based on the foundation of the four basic principles. At present some of the people who wave the banner of emancipation of the mind are in fact advocates of bourgeois liberalization. Seeking to break away from the leadership of the party and the socialist cause, they directly violate the four basic principles. This goes to show how great the differences are between objective reality and their own subjective world. If with regard to such people we fail to carry out ideological reform, will it not be impossible to achieve true emancipation of the mind? It is perfectly clear that if we are to emancipate the mind, we must first of all uphold the four basic principles and then work ceaselessly to reform any aspect of our thinking that does not accord with the four basic principles. In this sense emancipation of the mind is interlinked with ideological reform. Moreover, such emancipation presupposes the transformation of one's own subjective world. It is impossible to talk of any emancipation of the mind if an individual either fails to take an active part in the practice of changing the objective world or, during the course of such efforts to change the objective world, neglects to pay attention to transformation of their own subjective world. To put it mildly, for people who have such an attitude, emancipation of the mind is nothing more than idle talk; or, put more harshly, such people are merely selling their own contraband goods under somebody else's banner.

The problem at the moment is that many comrades, including some leading cadres, lack any consciousness of self-reform. They become extremely resentful and contrary as soon as anyone mentions reform, criticism or self-criticism. This only goes to prove that as far as these comrades are concerned there is an even greater need for reform, criticism and self-criticism. Comrade Mao Zedong once modestly said, "As to myself, I used to have all sorts of non-Marxist ideas, and it was only later that I embraced Marxism. I learned a little Marxism from books and took the first steps in remolding my ideology, but it was mainly through taking part in class struggle over the years that I came to be remolded. And if I am to make further progress, I must continue to learn; otherwise I shall lag behind." ("Selected Works of Mao Zedong," Vol 5, pp 382-383) While Mao Zedong had made a great contribution to the revolutionary cause, he still recognized his own need for continuous reform and study. So how can cadres at any level, all of whom are the students of Comrade Mao Zedong, possibly say that there is no need for such reform? The fact that Comrade Mao Zedong made some mistakes in his later years merely goes to show that every revolutionary must follow these words.

However, some comrades are still unwilling to reform themselves even though it is perfectly clear that their own subjective world is divorced from the objective world, that their own ideas, positions, views and writings are both different from or even divorced from revolutionary practice and do not suit or may even run counter to the demands, wishes and will of the masses. This is obviously a case of people sticking to their old views, methods and experiences, even though conditions have changed and history has advanced. How can such an ideological condition possibly suit the needs of socialist modernization? How can it suit the glorious mission of our party? While we are not able to raise again the slogan "ideological reform," we must at no time slacken our efforts to reform our subjective world. In carrying out our remolding of the objective world we must raise our consciousness of self-reform and work ceaselessly to reform our own subjective world. The only correct attitude is one that unites these two in both understanding and practice.

ON THE QUESTION OF ACHIEVING GREATER INVESTMENT RETURNS

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 20-23

[Special commentary by Song Shaowen [1345 0508 2429]]

[Text] At the 4th session of the 5th NPC, Comrade Zhao Ziyang suggested a new road of development which really conforms with our country's actual conditions and advocates a relatively dependable rate of development that can produce comparatively good economic results and from which people can derive fairly substantial benefits. He pointed out: "It is a pivotal point that we must, by thousands of ways and means, upgrade the economic results from production, construction, circulation and other sectors." Herein, I propose to discuss the question of achieving greater investment returns.

I

Since the founding of the PRC, our accomplishments in economic construction have been enormous, but the losses from extravagance and waste have also been startling. There has been much disparity between the degree of improvement in the people's standard of living and the amount of their labor contributions. According to statistics from the State Statistical Bureau, of the construction investments made from 1950 to 1979, only 70 percent have been formed into fixed assets, of which there is still a portion which is unable to perform its role or which has not yet formed any productive capacity. In other words, a large amount of investments have been wasted. In 1980, the value of the country's industrial fixed assets increased by 26 times over that of 1952, the year when the nation had just completed its economic recovery, but the gross industrial output value increased by only 14.5 times. According to a preliminary estimate, it was found that on the basis of the average figures over the years, the proportion of industrial fixed assets which could accomplish normal production results was only 70 percent of the whole. From 1957 to 1980, the gross industrial output value derived from each yuan of industrial fixed assets dropped year by year: in 1957 it was 2.88 yuan; in 1970, 1.78 yuan; in 1975, 1.4 yuan; and in 1980, 1.2 yuan. The amount of gross industrial output value derived from each yuan of industrial fixed assets in 1980 was 41 percent of that in 1957. As for the amount of profits and taxes derived from each 100 yuan of fixed assets, the average for the "fifth 5-year plan" period was only 35 percent of that for the "first 5-year plan" period. All this illustrates that in return for the labor input of the people (materialized labor and living labor), the volume of income and products derived has greatly diminished. In other words, with double the effort only half, perhaps less than half, of the result was achieved, and 2 yuan now are not worth as much as 1 yuan before. This represents the most gigantic waste in the economic life of our country over the past 20 years. If the investment returns could match those during the "first 5-year plan" period, industrial production in 1980 would have been twice as high as what was actually accomplished.

II

There are many causes for this serious waste and poor returns in the investment sector. Basically, they were inseparable from the "leftist" guiding thought in economic construction over a prolonged period of years. I believe that a concrete analysis will reveal the following three major factors:

First, faults in strategic decisionmaking and construction policy. Since 1958, the economy has undergone vast and catastrophic changes, all of which can be ascribed to blindly striving for a high rate of development. A dependable growth rate must be built on a foundation of the actual productive forces available. Blindly striving for a high growth rate will necessarily expand the accumulation rate and lengthen the capital construction front. For example, the blind call to double steel output made it necessary to launch a big steel-refining campaign while striving to realize an annual steel output of 60 million tons had to be followed up by the building of several large iron and steel bases. Similarly, seeking the early realization of the four modernizations has brought in its wake many projects which required enormous efforts and early completion, besides the importation or introduction of numerous new projects. Indeed, careless decisionmaking on big and important construction projects makes it difficult to handle many of them well, and a faulty construction policy can bring about serious consequences. For example, the anxiety for the early realization of agricultural mechanization, and the call to the various provinces, municipalities and autonomous regions to form separate systems of their own to achieve this purpose, have brought about the building of countless agricultural machinery plants in a blind manner and have caused over half of the production capacity to lie idle. Actual practice has shown that a definite speed can be achieved only through man's subjective wishes corresponding to the objective laws and the exertion of subjective efforts. Blindly chasing after speed, like the foolishness of pulling up the roots of a seedling plant to help its growth, is not only useless but harmful. Seen from the experiences of the first 5-year plan, the industrial production growth rate for any one fiscal year depends on the newly added production capacity of the same year to the extent of only a few percent. This is rather limited and any attempt to exceed this objective possibility will bring about catastrophic fluctuations and punishing results. Indeed, on this score we have learned very painful lessons.

Second, in reality since 1958 we have not had in force a medium-term or long-term plan. Investments under the yearly plans were made more or less according to the circumstances of the moment. They were merely strategic arrangements, whereas considerations for long-term planning, for taking the whole situation into account and for achieving an overall balance have been sadly lacking. As a result, a disproportion was created between accumulation and consumption, between the various departments of the national economy, and between the industrial and communications departments. The iron and steel and machine-building industry departments for a time became long lines [a glut or oversupply of products] (within the departments themselves, there were both long lines and short lines [products in short supply]), while departments handling energy, communications and transportation, education, light industry, forestry and construction of public utilities in cities and towns became short lines. Conversion from long line to short line is difficult while the opposite is time consuming. Seen from the experiences of the first 5-year plan, a fixed rate of development will bring prosperity to the national economy, improve the people's standard of living, and make the people happy. Otherwise, there will be vast fluctuations in capital construction and often the construction period is unduly extended. For example, in the first 5-year plan period, for large- and medium-scale projects the construction period averaged about 6 years each, but in the fifth 5-year plan period, it was increased by 12 years and the construction cost was doubled, thus wasting a lot of money. This deeply affected the improvement of the people's standard of living and caused great difficulties to current economic readjustment work.

Third, the irrational economic management system which encourages the demarcation of separate units, each with a system of its own, has been responsible for the waste of much valuable capital through extravagant and wasteful expenditures on duplicate construction, duplicate scientific research and duplicate importation of foreign technology. As a result, on the whole, little net production results have been achieved. Indeed, there are many problems in this respect, particularly concerning the metallurgical products processing industry and the agricultural products processing industry. For example, there are in the country some 192 plants turning out internal combustion engines for agricultural use. They are distributed throughout 167 cities and towns. Currently, their production tasks take up only half of their production capacity, but some of the departments are still insisting on expanding their production capacity and are busy on new building and expansion work. Again, from 1972 to 1978, the production of machine tools yearly exceeded the production plan by about 100,000 units. In 1979, the excess production was 43,000 units and in 1980, nearly 40,000 units. Most of them were bought by enterprises run by communes or production brigades. By the end of 1980, the number of machine tool units owned by the collective enterprises was well over 700,000 (surpassing the total number of units in the whole country in 1965), making up one-fourth of the total number of units in the whole country. However, most of these collective enterprises were duplicative in nature. In regard to the agricultural products processing industry, there has been a large increase of small textile plants, small wineries, and small cigarette plants. As a result, many abnormal phenomena have appeared, such as competing for raw materials and for markets, the small squeezing out the big and plants producing substandard goods replacing plants producing good quality products, and so on. Much money has been wasted in this fashion.

Many other causes have branched out from the three above-mentioned main causes and have led to much extravagance and waste. Fairly outstanding among them is the failure to observe the capital construction procedure. Normal capital construction procedure should be as follows: (1) Several comparative plans must first be prepared for deliberation. In preparing these plans we must first do the necessary investigation and research and subject the plans to technical and economic comparison and analysis. (2) Following repeated deliberation and discussion, and also taking into account actual need and possibility, a workable plan should be selected. (3) Prospecting, surveying and planning work should then proceed on the plan selected, and in the course of the planning consideration must be given to the possibility of supplementary and accessory construction work both inside and outside the plant. (4) Under the logical premise of this preliminary preparation work having been completed well and after having made sure that the plan is in accordance with the principle of overall balance, consideration may then be given to its inclusion into the medium- and long-term plan. (5) Planning will next proceed on the work in accordance with the capital construction plan. The planning should specify details of the construction work in time periods and stages so as to ensure that the project will be completed and put into operation on schedule. The capital construction procedure is in reality an organic whole. Poor work done on any of its parts will cause enormous losses and extravagance. For this reason, it is entirely correct that careful research has been done on extra-large projects such as the plan "to carry water from the south to the north," the water conservancy work at the Changjiang River gorges, and others. In the past, in carrying out many construction projects, preliminary preparatory work was frequently neglected. In some cases, even before the resources and the geological data of the locality had been ascertained, hasty decisions were made on the plant location and on planning and work procedure, and construction actually started. The idea seemed to be to do the planning along with actual construction in progress, to make on-the-spot revisions, to make repeated changes, and to engage in construction work on a stop-and-start basis. The results were that when problems arose, they had already become very serious. The construction period had to be extended and the investments increased repeatedly. Some of the projects eventually had to be abandoned. It could be expected that the larger the projects involved, the greater the losses and extravagance. The project on piping natural gas out of Sichuan Province is a case in point. In addition, there were many capital construction projects in which the internal and external parts could not form a whole, or which could not form any productive capacity or could not be put into production. There were also cases in which the management was in great disorder and could not carry out construction work according to a scientific work procedure, thus causing the abnormal situation of a large number of construction workers drawing their pay regularly, but actually not having any work to do. There are, of course, many causes which can lead to the extension of the construction period, or to the poor quality of the economic results, or to doubling the time required for the full recovery of the investments, but seen from the standpoint of management organization, the failure to abide by the capital construction procedure has been a major cause. We must indeed rectify the above-mentioned defects.

III

In connection with the three major causes mentioned above, I believe that there are at least three basic measures to improve investment results:

The first measure is to do the utmost to avoid errors in strategic decision-making and the construction policy. Since the 3d Plenary Session of the 11th CCP Central Committee, and particularly since the sixth plenary session's correction of the effect and influence of the "leftist" guiding thought, everybody has considered that the evil wind of blindly seeking high targets and enlarging the scale of capital construction at will has become a thing of the past. However, in order to basically avoid repetition of the errors of giving blind directions, we must still seek protection from economic legislation and from the improvement of the system itself. (1) In regard to strategic questions and questions of important economic construction policy-making, we must first carry out full investigation and research work on the topic involved. The principle of "without investigation there is no right to speak" must be thoroughly implemented. A minority must not be allowed to make decisions. Socialist democracy must be encouraged and developed, and the system itself must give it due protection. Important policy-making problems concerning especially large projects, such as "Baoshan steel" and several other important production projects, should first be carefully scrutinized by technical and economic experts. After repeated deliberations, the experts should present plans for comparison. The projects should then be submitted to a larger circle of people for democratic discussion, following which the leadership should make a decision from the options and select one of the projects. This will ultimately be submitted to an organ of the people's representatives for appraisal and approval. (2) All those in charge of the discussion and deliberation work, including the leadership cadres and the approving organ, should implement the responsibility system and should bear a suitable responsibility for the accuracy or inaccuracy of the decision made. This will rectify the situation of nobody being responsible for incorrect decisions.

The second measure calls for greatly strengthening planning work and the compilation of a medium- and long-term plan which can generally reflect objective economic laws. This aims at bringing into full play the superiority of a planned and proportionate development of the socialist economy. This also aims at utilizing well all construction investment funds, including those already included in the budget and those outside the budget. As for the construction projects, the measure will endeavor to make suitable arrangements for ensuring that both heavy and light projects, urgent and not so urgent projects, and the number of projects in each category are considered. This will include consideration of the necessity and feasibility of the projects. This is an important matter having a bearing on the rate of progress of our country's four modernizations and constitutes the pivotal center of the medium- and long-term plan. (1) All construction funds, be they within the budget or not, regardless of to what level or class they belong and regardless of whether they are for technical restructuring and equipment renewal or for new building and expansion, must be subject to an overall appraisal and unified arrangements. (2) In the case of construction projects, including the many projects requiring technical restructuring work, we must rigidly stipulate the proportion of gross investments to be allocated to those projects, the schedule for completion and handing over of which is 1 year, 2 years, or 3 years. It may be worthwhile to stipulate in the 5-year plan that those projects which will be completed within 3 years should constitute not less than 70 percent (on the basis of the funds involved), while the percentages occupied by the 1-year and 2-year projects should also be stipulated. These stipulations should have legal effect and should be subject to rigid checking in order to ensure their observance. During the first 5-year plan period, the 36 large and medium-sized projects completed, including the three large power plants in Harbin, a number of coal pits each with an annual capacity of 600,000 tons, and 300 km of major railroad tracks all had a construction period of less than 3 years, while the construction period of a large number of large- and medium-sized fuel-power stations and textile mills was also under 2 years. Current conditions might differ somewhat from conditions at that time, but after rigid and down-to-earth reorganizational work, we should be able to do just as well now as before. (3) In particular, we should be extremely careful in tackling the specially large projects (items involving investments of billions of yuan), because once work is started on them we must carry on until they are fully completed. This might require 8 to 10 years, during which time the state must continuously provide the investments without getting any immediate returns. During the first 5-year plan period, among the large projects, besides the Anshan Steel Works (investments in which from 1949 to 1959 were 3.09 billion yuan) and a small number of other extra large projects, the majority required an investment each of 200 to 300 million yuan. At present, the investments in the so-called "large" projects have been continuously increased, and projects requiring investments of several hundreds of millions of yuan are so numerous they are hardly worth noting. But this does not help at all in upgrading the investment results. We should have a mixed grouping of large, medium-sized and small projects and should not blindly strive for something big or foreign.

The implementation of the medium- and long-term construction plan and organizational plan must be based on a solid foundation of making a complete summary of past experiences, reorganizing the capital construction system, and formulating and rigidly enforcing capital construction legislation.

The third measure calls for combining the enthusiasm and planning work of the localities and the central departments. Blind efforts should be avoided as should useless investments such as those in duplicative construction, duplicative scientific research, and duplicative importation of foreign technology and capital. To achieve this objective, we must basically accomplish the following: (1) We must determinedly implement the policy of treating the whole nation as a single chessboard. All construction projects with a bearing on national equilibrium, including those of technical restructuring and those calling for "tapping potential, renovating or restructuring," regardless of their size, must be carried out under a national unified plan and be subjected to overall planning, and classified according to industry or trade and according to the category of its products. The readjustment of industries in central cities and towns should likewise be implemented under the guidance of a national unified plan. (2) As for those industries and trades which, viewed on a nationwide basis, already possess excess production capacity, we should, based on the principle of achieving an overall balance but taking into account the conditions of each case, proceed to have some of them closed, suspended, merged or shifted to other industries or trades. We should not continue with the former practice of ignoring the overall situation, lopsidedly stressing local needs, and blindly filling gaps or actually undertaking expansion under the pretext of technical restructuring. (3) We should reinforce our planned guidance over the industries run by the communes or production brigades. At the present time, enterprises run by the communes or production brigades have large amounts of funds in their hands. Viewed from the situation as a whole, if these funds are not put to proper use, they will be wasted and serious consequences might result, such as competing with the backbone enterprises for raw materials and for energy supplies and adversely affecting the production of the original enterprises. As already mentioned above, we should especially note the effect on the metallic products processing industry and the agricultural products processing industry. In a word, we must clearly stipulate how to use and how not to use funds belonging to the central and local departments, or to the enterprises, or to the communes and production brigades. Only in this way can we achieve the objective of each being provided for and avoid wasting money or wasting much money.

IV

It is indeed a difficult and complex task to achieve greater investment returns, to obtain 1 yuan's worth for every yuan spent, and to go a step further and realize the ideal of "spending less but accomplishing more."

In order to realize the above-mentioned objective, first of all, the whole party from top to bottom must be of one mind, strictly following Mao Zedong Thought in all their activities. Based on the concepts of "serving the people" and "categorically working for the people's interests," in undertaking any activity we should pay due regard to the situation as a whole. If there occur contradictions between partial interests and the interests of the whole, the interests of the whole should come first, and when there is conflict between current, or temporary, interests and long-term interests, long-term interests should take precedence. Only by having our thought smoothly adjusted will it be possible to handle well problems such as whether a project should be undertaken, whether it should be expanded, whether it should be closed, or whether it should be shifted to another industry or trade. In this way we can rationalize the investment structure to the fullest extent. Second, during the period of further readjusting the national economy, the enterprise control system must be appropriately reorganized. We must alter the current divided state of there being a multitude of systems in force which hamper each other. We must put the system and the organizational structure in smooth running order, so as to facilitate overall planning and overall arrangements. In this way, the various localities, departments, industries and trades can fully display their enthusiasm.

The socialist system possesses an unparalleled superiority over the capitalist system. The situation of enormous waste, low economic results, and the improvement in the people's standard of living not being in keeping with their labor input is by no means an inherent law of socialist economy. If only we can thoroughly rectify the old methods derived for a prolonged period from the guidance of "leftist" thought, greatly promote investigation and research, and earnestly do our work well, then it is certain that we can make good use of our funds and march on a new road toward higher investment returns.

THE REORGANIZATION, REFORM AND REVITALIZATION OF CHINA'S MACHINE BUILDING INDUSTRY AS SEEN FROM SHANGHAI

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 24-28

[Article by Zong Tang [1350 2768]]

[Text] Not long ago I joined a factfinding group of the State Machine Building Industry Commission and visited more than 60 machine building plants and research institutions in Shanghai. As seen from the situation in Shanghai, the 10 principles for economic construction put forth by Comrade Zhao Ziyang at the 4th session of the 5th NPC have great guiding significance for reorganizing, reforming and revitalizing the machine building industry in our country.

Be Good at Making All-Round Arrangements and Dare To Make Major Breakthroughs

Comrade Zhao Ziyang pointed out that carrying out technological reform and equipment renewal in existing industrial and communication enterprises is a key issue for the smooth development for our economy. In order to carry out technical reform, it is imperative to have general planning, while various enterprises must have their own concrete requirements. This work must first of all be carried out in industrially advanced key cities and a number of key enterprises by stages and in groups.

Thanks to the efforts made over the past 32 years, our machine building industry has developed from small-scale to large-scale, from assembling to manufacturing, from copying to designing, and from making single machines to making complete sets of equipment. It has made rapid development and has provided our country with an enormous amount of technical equipment and mechanical and electrical products for daily use. Taken as a whole, our machine building industry has basically formed a material base for providing various kinds of technical equipment for our country's modernization program. Our task is, through reorganization and reform, to enable the industry to give play to its strong points and overcome its weak points so that it will be able to develop vigorously and make contributions to the modernization program. Reorganizing means that it is necessary to follow the principle of coordination among specialized departments, organize coordination in the production of parts and in technology, and form a rational production system.

Reforming means reforming technology and equipment, speeding up the improvement of product quality and renewal. The purpose of reorganizing is to solve the question of rationalization in production while that of reform is to solve the problem of technological modernization. They complement each other and develop simultaneously. It is a very complicated task, and therefore it is necessary to work out unified plans and make all-round arrangements so that various trades, departments and localities will be able to play their proper roles and promote each other. It is also necessary to grasp well the production of certain key products and the tasks in certain key cities, concentrate our efforts on solving one problem after another so as to make major breakthroughs, use the experiences of selected units to promote the work in the entire area and maintain a harmonious development.

Shanghai is the greatest coastal key city of our country and its machine building industry has many features. First, it has greater output value, accounting for one-sixth of the gross output value of the national machine building industry. Second, it has a better technical foundation and better quality products with more varieties. Third, it has fairly complete departments with better conditions for coordination. Fourth, it has stronger adaptability and digestive capacity. Fifth, it has better management and economic effects. For example, the fixed assets of the system of Shanghai's No 1 Bureau of Mechanical and Electrical Industry make up about one-eighth of the system of the First Ministry of Machine Building Industry, but the output value of this bureau comprises more than one-quarter, the profits handed over represent almost one-third, and the profits made in 2 years equal the original value of the bureau's fixed assets. The annual output value for 100 yuan of fixed assets of Shanghai's Instruments and Telecommunications Bureau is as high as 995 yuan, almost 5 times the national average level, and the profits made in 1 year equal the original value of the bureau's fixed assets. The profits handed over to higher authorities by these two bureaus over the past 3 decades and more is 24 times the amount of state investments. Of course, the city has disadvantages such as overpopulation, and its machine building industry must not be developed excessively. These problems also exist in Beijing, Tianjin, Shenyang and other key cities, but to different degrees.

Therefore, in my view and under the premise of unified planning and overall arrangements and under the condition that no new factories are to be built, we must be bold in letting Shanghai and other key coastal cities give play to the advantages of their technology, get ahead of the rest, and turn out products that require intensive technology and that are export-oriented, so that they will be able to promote vigorously the development of the whole machine building industry and make preparations in materials and technology for the further development of our economy. Consequently it is necessary to readjust and restructure guiding ideology, general planning, the organizational system, and policies and measures.

Technological Reform in the Machine Building Industry Must Start With Transforming the Structure of Products

The problem of how technological reform in the machine building industry in our country should be started is yet to be fully resolved.

Some people hold that although the number of machine tools owned by our country's machine building industry ranks second in the world, most of the machinery is outdated and was manufactured in a rough and slipshod way, and only one-third of it can really play its proper role. Therefore, these people suggest that technological reform of the industry must start with renewing equipment.

Others hold that the technology of our machine building industry, particularly the technology in mass production, is too backward. Therefore, they suggest that technological reform must start with making innovations in the work process.

Still others hold that the current main contradiction in our machine building industry is that the technology of products is too backward and it cannot meet the needs of the people's livelihood, economic construction and expansion of exports. Therefore, they suggest that technological reform must start with transforming the product structure.

My view is that all the above-mentioned problems really exist and they are closely related to each other. With regard to a unit, technological reform must be carried out according to specific conditions. It must start with the weakest link; it cannot be carried out indiscriminately.

But taken as a whole and compared with the world's advanced level, our machine building industry lags behind in many aspects such as variety, quality, complete sets and services. It is true that we have made great achievements over the past 3 decades, but the quality of many mechanical products is low, the varieties are too few, the products are mainly not in complete sets while the related services are too backward. We will neither be able to revitalize our machine building industry nor to realize the socialist modernization program unless we are determined to completely solve these problems through consolidating the foundation, upgrading standards, sparing no efforts in producing complete sets of products and stepping up services.

How do we solve these problems? My view is that we must solve the problem of backwardness of our equipment and technology. But the most important thing is to solve the backward nature of our products so as to solve the problem of adequately serving the people. Technology and equipment are means or methods, while our purpose is to manufacture good products. The principle of technological reform should be: to proceed from improvement and renewal of products through substitution, by means of reforming work processes and renewing equipment so as to reach the goal of producing high-quality products at low prices. According to the demand for products, work processes that are not reformed must be reformed and equipment that is not renewed must be renewed. If we spend a lot of money on technological reform and equipment renewal and still cannot manufacture quality products, then we are just shooting an arrow at a nonexistent target and putting the cart before the horse. Consequently, the more we carry out such technological reform, the more our country will lose.

An analysis made by the First Ministry of Machine Building showed that of the total existing mechanical products across the country, only 5 percent have the technology that equals the level of the 1970's. The amount of products with 1970's technology in Shanghai, which has a higher technical level, only makes up 10 percent while the remaining 90 percent are of the 1960's or the 1940's and the 1950's. Most of these products are characterized by poor structure, low efficiency, high consumption of energy and materials, and short life-span. For example, the "Shanghai" limousines are of poor quality and have high gasoline consumption. The car consumes 13.5 kl of gasoline per km, 4 kl more than the gasoline needed by similar cars made in West Germany. This means that the car has to consume 12,000 kl more fuel to cover a distance of 300,000 km, with 7,400 yuan in fuel costs. Our internal combustion engine consumes 10 to 20 grams more gasoline per hph than a foreign one, and if we use the annual production of the engines in Shanghai as the basis, this means that we have to consume about 60,000 tons more gasoline a year. Our thermoelectric power generating units consume 5 percent more coal than foreign ones, their quality is unstable, stoppage rate is high and regulating efficiency is low. We have to work harder before the units we produce are safe, stable and able to operate at full capacity. The average heat utility rate of our industrial boilers is 20 to 30 percent lower than that of foreign products, while the efficiency of our water pumps, air blowers and other products is 5 to 10 percent lower. Therefore, if we do not work hard to improve product quality and if we renew old equipment for backward products, we will not only be unable to realize the modernization program but will also lag further behind the world's advanced level.

The key to improving product quality is to step up research and development. We must transform old products, study and turn out new products, and study and predict the products of the new generation. In maintaining their competitiveness and in order to survive, foreign enterprises are spending a lot of money on research and development of new products. According to the Japanese Hitachi Company, if an enterprise spends 1 percent of the total sales of its commodities on research and development, this enterprise will fail. It will be able to just survive if it spends 3 percent. It will be able to compete with 5 percent and develop with 8 percent. The situation in other countries is almost the same. What about our enterprises? The research and development costs of the Shanghai electronics industry were maintained at a little more than 2 percent of the total sales in the past many years and they were increased to 6.85 percent in 1973. But this figure has continued to drop over the past few years: it dropped to a little more than 2 percent, then a little more to 1 percent and at last to below 1 percent. Over the past 20 years and more, the research and development costs for the "Shanghai" limousines have been maintained at 0.4 percent of total sales. The state has stipulated that the dozen machine building plants in Shanghai with expanded decisionmaking power can only put aside 3 percent from profit retention for production development funds. The funds are used for the nine major items, and only 8 percent are used in research and development on products. This figure is less than 0.1 percent of the total commodity sales. If this situation continues, our enterprises will not only be unable to develop new products but will also be unable to improve old products. Consequently we will not be able to solve the problem of the "fixed 20-year system" for mechanical products.

A certain amount of money is needed in stepping up research and development work in our machine building industry. If we calculate the costs of this work on the basis of 1 to 2 percent of total sales, several hundreds of millions of yuan are needed each year. Part of these costs are included in production costs. For the remainder, the industry depends on the state to set up special funds for research and development. It is understood that during the economic readjustment period our country is faced with financial difficulties. But my view is that with financial difficulties, it is even more important for us to use the limited money properly. Since we are able to allocate tens of billions of yuan each year for capital construction, why can we not allocate several hundreds of millions of yuan for research and development, which is more important than capital construction? As Marxists, we must be able to see even farther into the future and we can no longer hesitate in this matter.

Be Determined To Promote the Production of Basic Components and Basic Machinery

Comrade Zhao Ziyang said that we have to conserve our strength during the sixth 5-year plan so that we will be able to form a better foundation for further carrying out technological reform in our national economy during the seventh 5-year plan.

One of the most important tasks for our machine building industry during the sixth 5-year plan is to form a solid technical foundation.

An important reason for the low quality of our mechanical and electrical products is that our basic mechanical products and electronic components are poor in quality. Another reason is that the quality of our basic machinery is low. We have a large quantity of machinery, but it is characterized by low quality, low precision, low speed and high noise level. In particular we lack some key precision machine tools, such as digital control machine tools, and consequently we cannot produce high-precision parts. We also do not have enough precision measuring and testing apparatuses to check the quality of processing. An old saying goes that in order to attain a good result in one's work, it is necessary first of all to use good tools. It is true that with low-quality basic machinery we are still able to produce some quality products, but we cannot mass-produce them, and this is our weakest point.

Without good-quality basic components and basic machinery we will not be able to improve the quality of our mechanical products and we will lack a technical foundation for renewing the products. Therefore, we must be resolute in making use of the readjustment period and manufacture quality basic components and basic machinery so as to form a basic technical foundation. In order to improve the quality of basic machinery parts, I suggest proceeding from improving the quality of such products as hydraulic parts, sealing parts, oil inlets of oil pumps, low-voltage electrical products, bearings and gears. We must work hard to improve the reliability of our electronic products to minus 7 grade. With regard to basic machinery, I suggest producing or improving the quality of 30 types of precision machine tools and 10 types of digital control machine tools. At the same time, we must also solve the problems of precision measuring and testing apparatus.

In order to produce improved quality basic components and basic machinery it is imperative to organize scientific and research work in a big way so as to master advanced technology. The experiences in organizing the work for mastering the advanced technology for the nine major items of equipment in the 1960's have been very good. We must proceed from the features of each product, organize organically the technical strength of scientific and research units, colleges, factories and enterprises, form technical responsibility systems and assign people who have a certain amount of decisionmaking power to be responsible for technical matters. This work must be started by studying basic theory, then studying basic materials, basic work processes and basic components. It must be started by studying advanced technology, then carrying out production, reorganizing specialization and technological reform so as to create production capability and make achievements. If we can do these tasks for several years, we will be able to form a good technical foundation.

Do a Good Job in Importing Technology and Increase Self-Reliance

Comrade Zhao Ziyang said that we must, by displaying our own advantages and through international exchanges, make up for our shortcomings and increase our self-reliance.

Over the past 2 years, the Shanghai machine building industry and electronics industry has imported a dozen small, individual technical items. The city has mainly imported individual technical items. It has also imported some major equipment and measuring and testing apparatus. There are differences between imported large and complete sets of equipment and imported small and individual technical items. First, they require less money. The average cost of the 11 items that have been put into use by Shanghai's No 1 Mechanical and Electrical Bureau is $450,000. Second, such items can be put into operation faster. The import of such individual items of technology is carried out by making full use of the existing factories and without having to build new ones. The small items are able to begin production in 6 months to 1 year, medium-sized items in 1 to 2 years, and the bigger ones in 2 to 3 years. Third, the results are better. With such items it is possible to improve quality, save energy, decrease the consumption of materials and decrease costs, increase profits, shorten the period for the study and production of new products, promote the transformation of old products, decrease imports, expand exports, open up more channels for selling and improve the vitality of enterprises. The Shanghai No 17 Radio Factory imported from Sweden manufacturing technology and key equipment for producing diodes at a cost of $110,000. The equipment was put into operation just 40 days after it arrived. The percentage of products up to standard increased from 75 to more than 95 and production capacity increased by 6 times. The factory also saved 80 percent on premises and 90 percent on energy. As a result, the cost of the diodes dropped from 90 cents to 50 cents. In a matter of less than 6 months, the factory was able to recover all its investment. The Pengpu Machine Building Plant was trying to manufacture

320-hp bulldozers, but it failed after 2 years of effort. It then imported technology and key parts and in a matter of 1 year began to manufacture products up to standard with sales prices 50 percent lower than foreign ones. All the products for this year have already been ordered.

In order to do a good job of importing individual items of technology, it is necessary to do a good job in division of labor so as to prevent duplication in importing technology. The most important thing is to select a good factory site. If we build a new factory without selecting a good site and without the ability to absorb technology, we will be bound to fail.

It is likely for places with a better technical foundation and stronger absorbing ability that the importation of small and individual items of technology will enable them to drastically reduce the gap between our level and the world level. But foreign capitalists are not willing to let us see their newest technology. Therefore, in order to scale the summits of technology, we must rely on our own efforts. We must oppose the idea of one-sidedly understanding the meaning of self-reliance and refusing new foreign technology; on the other hand, we must oppose the illusion of relying on the strength of foreign countries in realizing our modernization program. Modern science and technology are common results of the wisdom of mankind throughout the world, and the general law in the development of science and technology is that all countries must learn from each other's strong points and promote each other. An outstanding engineer must be good at absorbing new foreign technology so that he will save time by not starting from the beginning. He must be good at absorbing another's strong points to make up for his weak points and to improve his ability. On this basis, he must step up research and development work so as to reach the world's advanced level. In my view, this is the true self-reliance we need. With $100 million to $200 million a year, we will be able to import 100 to 200 individual technical items, and in one decade we will have 1,000 to 2,000 such items. On this basis, we can make thousands of such technical items by ourselves and these items will be very useful for improving the technology of our machine building industry.

Make the Machine Building Industry a Strategic Export Industry

I visited a number of machine building plants in Shanghai which produce export-oriented products. The conditions and technical level of these plants can still be improved. But I believe if we do our work seriously, the products of these plants will be able to enter the international market, while some might well surpass the general foreign level. Exports of these products is very limited at present, but I have the feeling that a single spark can start a prairie fire. Therefore, as long as we are able to do our work boldly and conscientiously, these plants will have bright prospects. But, based on some methods we are now using, we are not encouraging enterprises to spare no effort to expand their exports. On the contrary, we have covered their eyes to prevent them from understanding international market situations. Based on these methods, the more the enterprises export the more economic losses they will suffer. As a result, the workers' welfare will decline and the enterprises themselves will not be active in exporting their products. If the state regards Shanghai as a base for the export of machinery and helps transform and support the city's machine building industry, such exports will no doubt drastically increase.

Other key coastal cities have conditions similar to Shanghai's. If these cities are encouraged to "push outward" by exporting their products, they will be able to lead the whole machine building industry to march into the international market in breadth and depth.

The development of our machine building industry depends mainly on the domestic market. But, under current international conditions, it is important to pay attention to opening up the international market. In order to realize the modernization program, our country needs enormous foreign exchange. How can we obtain foreign exchange? In the past we pinned our hopes on oil exports and now we pin them on coal exports. But at present the supply of energy in our country is tight and consequently the development of the whole economy has been limited. Is there a better way in the future besides stepping up the exploitation of oil and coal? Japan has virtually no energy resources but its economy has been developing rapidly. In the early 1950's, the Japanese saw that they had the capability to produce sewing machines and ships for the international market. This increased their self-confidence. Consequently, they developed the machine building industry as a strategic export industry and concentrated their efforts on reorganizing, reforming and revitalizing the industry. Following 10 years of effort, Japanese mechanical and electrical products dominated the international market and earned an enormous amount of foreign exchange (now about $60 billion annually) and supported economic development. Compared with Japan in the 1950's, our machine building industry now has a greater capacity, is greater in scope and has more advanced technology. In addition, the wages of our workers are low. Therefore, our machine building industry has a certain competitiveness. If we are able to carry out technological reform and work hard for 10 years, we will no doubt be able to develop an advanced manufacturing industry, gradually expand our international market, obtain an enormous amount of foreign exchange for the state and step up our modernization program. It is more advantageous economically and technically, and easier to achieve results, to combine the advantages of resources, technology and labor power and expand processed products rather than just export resources. If several years later we are able to export 10 billion yuan of mechanical and electrical products annually, this figure will then be comparable to the export of 40 million tons of oil or 200 million tons of coal. Therefore, we have to use a certain amount of money for research-development and technological reform in our machine building industry, and these costs are much lower than those required to exploit oil and coal.

International competition will help develop the domestic market. We must make use of the motivating force of international competition to change our business thinking, improve our management, change our bad habits and laziness, improve the quality of our products, increase variety, improve our ability to produce complete sets of equipment and improve our services, so that our machine building industry will develop vigorously and our economy will develop as a whole.

Therefore, I suggest that the state must promote the machine building industry as a strategic export industry, consider the whole problem as an important task, take various effective measures, and open up a road for expanding the export of mechanical and electrical products. These tasks are of great significance in helping to accelerate our socialist modernization program.

COMRADE LIU SHAOQI'S CONTRIBUTIONS TO MAO ZEDONG THOUGHT--STUDYING VOLUME 1 OF THE 'SELECTED WORKS OF LIU SHAOQI'

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 29-31, 17

[Article by Shi Zongquan [4258 0112 3123]]

[Text] Volume 1 of "Selected Works of Liu Shaoqi" has come off the press. The glorious image of a great Marxist and proletarian revolutionary appears again before us. During the long years of revolutionary practice, Comrade Liu Shaoqi steadfastly persisted in applying Marxist theory to creatively solve the concrete problems of the Chinese revolution. Volume 1 of "Selected Works of Liu Shaoqi" is the product of the integration of the universal principles of Marxism with the concrete practice of the Chinese revolution as well as the scientific summing up of the rich experience of the Chinese revolution. Regardless of whether in the harsh class struggle against class enemies both at home and abroad or in the complicated struggle over principles against the erroneous line and tendencies inside the party, Comrade Liu Shaoqi always stood on the side of the correct line represented by Comrade Mao Zedong. He made enormous contributions to the formation and development of Mao Zedong Thought and to the propagation and popularization of Mao Zedong Thought.

I

At the memorial service for Comrade Liu Shaoqi, Comrade Deng Xiaoping pointed out: Comrade Liu Shaoqi was a Marxist theoretician of our party and he was good at raising practical experience to the height of theory. "He made important contributions in both practice and theory to the building of our party, to the workers' movement in our country and to party work in the White areas. The theoretical viewpoints and ideological principles he advanced in these respects crystallized the experience accumulated by the party and the people in their heroic struggle over the decades and were a component of the scientific system of Mao Zedong Thought." The valuable works written by Comrade Liu Shaoqi during the period of the democratic revolution and compiled in volume 1 of "Selected Works of Liu Shaoqi" fully testify to the correctness of his theses. Comrade Liu Shaoqi contributed to the shaping and development of Mao Zedong Thought in many ways and also made unique contributions particularly in the fields mentioned by Comrade Xiaoping above.

First, in the field of party building, Comrade Liu Shaoqi was one of the outstanding leaders of our party. Regardless of whether working in the locality or the Central Committee, he always racked his brains and devoted tremendous energy to the work of building our party into a political party of the proletariat. He laid special emphasis on the building of the guiding ideology of the party and gave priority to raising the level of Marxist theory of the whole party. He pointed out that the revolutionary spirit of fearing no sacrifice and the work spirit of hard struggle of the Chinese Communist Party is very admirable, but in guiding ideology, the understanding of Marxist theory is inadequate, and this is one of the greatest weaknesses of our party as well as the subjective reason for the repeated setbacks suffered by the revolution in the past. "As long as this weakness is overcome, the Chinese Communist Party will have every assurance of leading the Chinese revolution to total victory." Therefore, "the advocation of theoretical study in the party has become very essential." ("Selected Works of Liu Shaoqi," Vol 1, p 220--only the page number will be given henceforth) He said that the mass line is not only a fundamental political line of the party but also an organizational line of the party and scientifically summed up the mass standpoints as: "Everything for the people, holding oneself responsible to the people, having faith in the people's ability to emancipate themselves and learning from the people." (p 354) He stressed that all the organizational work of our party must be closely integrated with the masses and that we must adopt a correct attitude toward the masses and use correct methods to lead the masses. He attached great importance to the self-cultivation of party spirit of the party members and raised party ideological construction to a new height. He pointed out: "The supremacy of the party's interests is the highest principle that must govern the thinking and actions of the members of our party." "Unhesitating readiness to sacrifice personal interests and even one's life for the party and the proletariat and for the emancipation of the nation and all mankind--this is one expression of what we usually describe as 'party spirit.'" "It is the highest expression of communist morality, of the principled nature of the party of the proletariat, and of the purest proletarian class consciousness." (pp 130, 131) He systematically summed up the historical experiences of inner-party struggle and suggested correct policies and methods for launching inner-party struggle. In the light of the leftist mistakes in inner-party struggle in history, he emphasized: "Inner-party struggles consist principally of ideological struggles." (p 179) He called for making a sharp distinction between educating the comrades who have made mistakes and struggling against the enemy. On the other hand, he also opposed the liberalist trend of giving up ideological struggle and pointed out: "Inner-party struggle is a struggle over principle," and strict self-criticism is the motive force advancing the progress of our party. (p 187) He also regarded the correct handling of the interrelations between the masses, classes, political parties and leaders as an important aspect of party building. These ideas of Liu Shaoqi's enriched Comrade Mao Zedong's theory on party building and fostered large numbers of revolutionaries and party members.

Second, Comrade Liu Shaoqi was for a long time an outstanding leader of our labor movement. He took part in the labor movement not long after he joined the revolution and displayed his revolutionary spirit of selfless heroism and outstanding leadership ability for the emancipation of the working class. He was one of the principal leaders and organizers of the Anyuan general strike, the Shanghai 30 May movement and the Guangzhou-Hong Kong general strike which shocked the country and the whole world. He was good at integrating the political task of the party with the immediate interests of the masses and stressed that in developing political struggle, attention must be paid at the same time to economic struggle. When summing up the experiences of the labor movement during the great revolutionary period, he pointed out that under the situation of the low ebb in the revolution, the economic struggle of the masses is at the same time a political struggle, and for the sake of "conserving the forces of the working class, it is imperative to pay special attention to leading the routine economic and political struggles of the workers." (p 35) In view of the shortcoming of not paying attention to setting up basic-level organizations and not developing party organizations in the trade union during the early period of our labor movement, he not only immersed himself with work in these two fields and made oustanding achievements, but he also summed up experiences in these fields and pointed out that only by setting up "a close-knit organization can the trade union fulfill its mission." (p 7) He paid great attention to the work of raising the consciousness of the workers. When criticizing leftist errors in the labor movement, he pointed out that everybody should be prepared to go and work wherever there are people. Such ideas as paying attention to the organizational role of the trade union, showing concern for the immediate interests of the workers and raising the consciousness of the workers, energetically advocated by Comrade Liu Shaoqi during the early period of our labor movement, are still of guiding significance even today.

Third, in the field of work in the White areas, Comrade Liu Shaoqi carried out an arduous and brilliant struggle in order to formulate and maintain a correct line for work in the White areas. Comrade Liu Shaoqi carried out the most resolute resistance and corrected the adventurist and dogmatic leftist errors represented by Wang Ming. He correctly analyzed the change in the balance of class forces after the great defeat of the revolution and proposed that the work policy in the White areas should give priority to defense and not offense; should take advantage of the legal status as much as possible in carrying out work and should not refuse to take advantage of the legal status; should strictly turn the open organization of the party into a secret organization in order to go deeply among the masses, carry out long-term concealment, conserve their forces and always be prepared to send their forces to develop armed struggle in the countryside and push forward the development of the revolution. He summed up the art of leadership for the mass struggle in the White areas and proposed that the slogans, demands and forms of struggle for developing mass struggle should be acceptable to the masses and should be based on the circumstances and conditions at that time and place and on the degree of consciousness of the masses. He advocated proceeding from reality, integrating the principle of struggle against the enemy with flexibility, taking full advantage of the contradictions among the enemy and winning over temporary allies to oppose the principal enemy. These policies and tactics formulated by Comrade Liu Shaoqi, together with Comrade Zhou Enlai's ideas concerning work in the White areas, constituted the basic theoretical principles of our party with regard to work in the White areas.

This is an important aspect of the valuable experience of our party as well as an important supplement to Mao Zedong Thought.

II

Comrade Liu Shaoqi was one of our party leaders who actively propagated Mao Zedong Thought. In his report on amending the party constitution delivered at the seventh party congress, Comrade Liu Shaoqi made an extremely penetrating and comprehensive summary and exposition on behalf of the CCP Central Committee regarding the contents and characteristics of Mao Zedong Thought, which enabled the whole party for the first time to have a more systematic and thoroughgoing understanding of Mao Zedong Thought. This had a far-reaching impact on the dissemination and popularization of Mao Zedong Thought.

Comrade Liu Shaoqi's summary and exposition regarding Mao Zedong Thought stressed the following points:

First, Mao Zedong Thought is the only theory and policy for saving China. After the Opium War, China had become a semicolonial and semifeudal society. The country was in dire straits and the people were extremely impoverished. People with lofty ideals continually stepped forward in large numbers to take the place of those who fell and endured great hardship to find the principle for saving the country and the people. Such theories as the parliamentary road, national salvation through industrialization, anarchism and guild socialism were unable to solve China's problems. "Only Marxism can save China." This is the correct conclusion obtained from history. However, finding the principle is not tantamount to being able to apply the principle, because Marxism is mainly "European in form" and very little has been written on the subject of China in the works of Marx and Lenin. "Moreover, the concrete road of historical development of the Chinese society is exceptional compared with the road of historical development of the societies of various European countries." (p 222) This required the changing of Marxism from the "European form" into the "Chinese form," or applying the stand, viewpoints and methods of Marxism to creatively solve the problems of the Chinese revolution. However, this point was not understood by the erroneous leftist and rightist leadership. In particular, the erroneous leftist leadership represented by Wang Ming made Marxism into a dogma, deified the Comintern resolutions and the experience of the Soviet Union and copied them indiscriminately. This tendency almost pushed the Chinese revolution to the brink of total failure. The Chinese communists, represented by Comrade Mao Zedong, waged a resolute struggle against the leftist errors and integrated the universal principles of Marxism with the concrete practice of the Chinese revolution. This enabled Marxism to take on Chinese characteristics and gradually evolve into a scientific system of guidelines suited to conditions in China. This is precisely Mao Zedong Thought. Under the guidance of Mao Zedong Thought, the forces of the Chinese revolution grew from small to big and from weak to strong and ushered in an unprecedented situation of victory. Comrade Liu Shaoqi said: "Historical events have shown that whenever the revolution followed the leadership of Mao Zedong and his theory of the Chinese revolution, it succeeded and developed; but whenever it departed from that leadership, it failed or had to retreat." Therefore, Mao Zedong Thought "is the only correct theory and policy to save China" and "the only correct theory and policy to guide the proletariat and all the working people of China in their fight for emancipation." (p 334)

Second, although Comrade Liu Shaoqi did not put forward the concept that Mao Zedong Thought is a crystallization of the collective wisdom of the Chinese Communist Party, he also did not regard the theory on the Chinese revolution as purely the personal thought of Comrade Mao Zedong. In 1941, he held that "some of the comrades in the party, especially those in the Central Committee, have a unified understanding of the Marxist theory and the historical development of the Chinese society." (p 220) In 1943, he again said: "The genuine Marxists in China are Comrade Mao Zedong and the many other comrades who have rallied around him. The line they have pursued and struggled for throughout the past years, and their methods of work, are, in essence, the Bolshevism of China." (p 296) In "On the Party" he said: The scientific theory on the Chinese revolution can only be "created by the representatives of the Chinese proletariat," "of whom the greatest and most outstanding is Comrade Mao Zedong." (p 333) Comrade Liu Shaoqi regarded Mao Zedong Thought as the thought of the Chinese Communist Party represented by Comrade Mao Zedong and truthfully reflected the objective process which led to the shaping and development of Mao Zedong Thought. What should be pointed out is: Not only is the shaping and development of Mao Zedong Thought a crystallization of the collective wisdom of the Chinese Communist Party, but the concept of Mao Zedong Thought also cannot be summed up as the product of any single mind. Regardless of whether it is Comrade Liu Shaoqi or other comrades, when advancing the concept of Mao Zedong Thought, they must not divorce it from the historical conditions of that time.

Third, Comrade Liu Shaoqi strongly stressed the necessity of using Mao Zedong Thought to unify the ideological understanding of the whole party and to root out all kinds of erroneous ideas, especially the influence of erroneous leftist ideas. Comrade Liu Shaoqi said: "In the course of our history we have suffered the most from errors that arose in the leadership of the revolutionary movement, which caused partial, sometimes serious, avoidable harm to the movement." (p 293) After the Yanan rectification campaign and the criticism of leftist errors represented by Wang Ming, the restoration of order out of chaos in guiding ideology could be described as initially completed. However, as the leftist errors had been dominant for a long time and had caused a great deal of harm in the party, their pernicious influence could not be rooted out within a short time. For the sake of enabling the party to make fewer mistakes and detours, it became imperative to unify the understanding of the whole party with Mao Zedong Thought. Therefore, Comrade Liu Shaoqi proposed: "The important task now is to mobilize the entire party to study and disseminate Mao Zedong's theory of the Chinese revolution, and to arm our membership and the revolutionary people with this theory, so that it may become a living, irresistible force." (p 337) Under the call made by Comrade Liu Shaoqi on behalf of the Central Committee, a movement to study Mao Zedong Thought quickly sprang up. With the whole party united under the banner of Mao Zedong Thought, a great victory was soon scored in the Chinese revolution.

Mao Zedong Thought is the correct theory for the Chinese people in carrying out revolution and construction as well as the spiritual wealth of our party. Comrade Liu Shaoqi had set a glorious example for us in adopting a correct attitude toward Mao Zedong Thought. In studying volume 1 of "Selected Works of Liu Shaoqi," we must uphold and disseminate Mao Zedong Thought with absolute sincerity in the manner of Comrade Liu Shaoqi.

WHAT ARE THE PROBLEMS THAT THE MARXIST THEORY OF CIRCULATION CAN HELP US SOLVE?

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 32-34

[Article in "Theoretical Study by Cadres" column by Lin Zilin [2651 1311 0500]]

[Text] Over the past year, the broad masses of cadres have achieved excellent results in their study of the Marxist theory of reproduction. This study is continuing this year. The editor of this "Theoretical Study by Cadres" column asked me to say something about the significance of this study. I talked on this subject a year ago, so I will just make a few supplementary comments here.

Although there are numerous problems in social economic life, they can all be summed up into two major problems. One is the economization of labor; the other is the proportionate distribution of labor. Both are problems that any society has to solve. According to Marxist theory, this is a common law of human social production.

When the natural economy, characterized by self-sufficiency, prevailed in human society, these two problems were solved in a simple way. For example, in a feudal manor or in a peasant family, the lord or the patriarch knew fairly well how much labor he had and how strong his production labor forces were. He had to distribute his labor for the production of his own necessities. He would plan how much grain and vegetables should be planted, how much livestock and poultry should be raised, and how much spinning and weaving should be done. He would also calculate, if he was able to save some labor from planting, raising animals, spinning and weaving, how many houses he would probably be able to build. On all these things, the lord or the patriarch could make decisions and arrangements himself.

However, with the development of the social division of labor and the exchange of products, production for the purpose of exchange, that is, commodity production developed and, over a long period of time, became the prevailing mode of production. Things are not quite the same now. The economization of labor and the proportionate distribution of labor are not as simple as in the old days; they have become rather complicated. The production of every producer must rely on social demands. Only by means of buying and selling, or through the channel of circulation, can his products be consumed, including consumption in production and consumption by people in their daily lives. At the same time, the consumption of every producer or every common person also relies on social production. Only through the channel of circulation can he obtain the things he needs in his production and daily life. In this, circulation seems to play an important role. The economization of labor and the proportionate distribution of labor can no longer be carried out directly in the course of production. Instead, they must be accomplished by means of circulation. Take a capitalist enterprise which produces teacups as an example. The boss of this enterprise has tried all means to economize on the consumption of materialized labor and actual labor. That is to say, he has reduced the production costs. Can we say then he will certainly make a profit by selling his cups? If his cups do not meet a need, or if there are already an excessive number of this kind of cup on the market, that is to say, his production does not accord with social demands, his cups will not sell well. Then the labor devoted in the production of these cups will be wasted, and the boss will not only make no profit but might incur a loss. If the situation is different, and the cups are all sold, but some raw materials or some spare production tools for making cups are in short supply on the market, the boss cannot purchase these goods. As a result, the process of reproduction will be interrupted and the machines and the workers will stop working. The economization on labor is then out of the question.

If products of all enterprises can be sold well, and the capital goods or consumer goods needed by the capitalists and the workers are all available, the production structure of the entire society must be in conformity with the social demands, and it can be said that conditions for circulation in the entire society are favorable. Therefore, the economization of labor and the proportionate distribution of labor are not only the internal affairs of individual enterprises, but a problem concerning the reproduction and circulation of the entire society.

The Marxist theory of circulation, including the theories on cycles, turnover and reproduction, has brought to light the laws on circulation in the whole society. What he spoke of was the circulation of capital. But, disregarding the forms of capital, this law is universally applicable to any social production.

This law can help people understand how important circulation is in the course of social production and commodity production.

It can also help people understand that, in an enterprise, in order to improve economic results, not only must the consumption of materialized labor and actual labor and the consumption of funds be economized, but the products must be made to suit social demands. Thus, measures in conformity with the law of circulation of funds should be adopted to speed up turnover and to reduce the amount of capital used. In this way, the funds can play a greater role.

Furthermore, it can help people understand how the circulation of funds in all the enterprises interact by determining and conditioning each other, and how these movements interlock with each other and constitute the general movement of funds in the entire society. People will then understand how all kinds of proportionate coordination of social production function as conditions for the movement of social funds. From this, people can find some regularity in the movement, such as what balance should be kept between two major categories of social production in simple and expanded reproduction, how compensation of value should be carried out between different social products, and how goods should be exchanged.

The economization of labor and the proportionate distribution of labor, which are the most common laws in social production, take different forms during different stages in the development of human production. When commodity production is the prevailing mode of production in the society, they take the form of the law of value. People have frequently discussed the law of value and expressed various opinions on it. In my opinion, the law essentially brings out the following two points: (1) the society only recognizes average necessary labor; (2) this labor must accord with social demands. If the amount of labor put in by a producer in the course of making a product is more than the average and necessary amount, the excessive part will not be recognized by society and the producer will be operating under adverse conditions when he puts his products into exchange. Even if the amount of his labor has not exceeded the average and necessary level, but his products are of a type which has been overproduced, his labor will not be recognized in society and he is still operating under unfavorable exchange conditions. Therefore, producers are compelled to make more efforts to economize on the consumption of labor and do their best to suit their production to social demands. During the period of nonmonopoly capitalism, all this was done in a spontaneous way and was effected completely through market competition. That is what is called a typical example of regulation by market mechanism.

Commodity production is not a social economic form or a given type of production relationship. There have been many social economic forms in history, but none can be called commodity production. So we cannot distinguish or decide the nature of a social economic system from whether commodity production exists in it or not. The essential feature of capitalism is wage labor, and commodity production based on wage labor is the production of surplus value. Our socialist society still needs commodity production. However, it is not based on wage labor but on united labor. The entire united labor represented by the socialist state enables us to consciously control social production. Planning is the means of this conscious control. However, various enterprises inside this economic entirety are socialist economic units which remain relatively independent. Their products, both capital goods and consumer goods, all become commodities. When value, currency, price and funds still exist, the conscious control by the state of socialist economic activities has to be effected through commodities and currency. The form of direct labor distribution in the entire society has not yet occurred. For example, economization of labor takes the form of economizing on the consumption of funds. The distribution of labor also takes the form of the allocation of funds. In his government work report delivered to the 4th session of the 5th NPC, Comrade Zhao Ziyang pointed out that "while upholding the planned socialist economy, we are giving scope to the supplementary role of market regulation and fully taking into account and utilizing the law of value when working out state plans." In production based on united labor, consciously applying the law of value to control the social economic activities, attaching importance to economic measures and devoting attention to utilizing economic levers can all be considered conscious applications of the law of value and all are facets of planning. This has functions that differ from market regulation. These are the manifestation of the law of economization of labor and proportionate distribution of labor in the current socialist society.

Only when we understand the law can we become conscious. Since conscious labor economization and proportionate labor distribution are necessities, research and study of the theory of circulation, including the economic theories of cycles, turnover and reproduction, are especially important.

The government work report by Premier Zhao pointed out, "The crux of the problem is to do all we can to get better economic results in areas of production, construction and circulation." The report also listed facts which show that economic results in our construction are not yet satisfactory, and analyzed the causes for this. It said, "From now on we must tackle all economic problems with better economic results as the fundamental objective, ensuring a more satisfactory sustained development of our economy." In addition, Premier Zhao held that "as far as readjustment is concerned, we should not only readjust the proportions between industry and agriculture, between light and heavy industries, and between accumulation and consumption; we should also readjust the product mix, the technological makeup, the line-up of enterprises and the organizational structure so as to rationalize the overall structure of our national economy. Therefore, economic readjustment covers a much wider range than we first envisaged. The overall restructuring of the economic management system will take an even longer period."

Economic results essentially are the economization of labor, or the achievement of higher labor efficiency. In the form of value, this is a reduction in consumption and the use of funds together with an increase in gain. Economic structure essentially means the proportionate distribution of labor which manifests itself in the form of the industrial makeup and distribution structure. As for the reform of the economic system, this involves all the areas in social life and has many related problems. If we sum these up, we can synthesize them into two major requirements: (1) to arouse the internal motive force of the socialist economy; (2) to handle the balance mechanism in the socialist economy. Their purpose is to achieve the economization of labor and the proportionate distribution of labor.

From now on, for a period of time, we will always face these problems and must properly handle them. At present, these problems are not very simple but rather complicated for us, and we have found that they involve many objective laws which we should recognize. If we can gradually understand them and properly apply them, we will certainly do a better job and solve the problems more smoothly. The Marxist theory of capital circulation can offer us theoretical guidance and help us solve these problems. That is why we should study this theory and that is also the significance of our study.

THE KEY LIES IN STRENGTHENING LEADERSHIP

Beijing RED FLAG in Chinese No 3, 1 Feb 82 p 35

[Short commentary in the "Theoretical Study by Cadres" column by Ji Xin [4764 6580]]

[Text] The experiences of the cadres in Jiangxi Province and Guangxi's Mashan County and what they have learned in the study of reproduction theory tells us that it is very important for our cadres to study theory in the new historical period and that they can study it very well, too. The key lies in strengthening leadership of CCP committees at various levels.

Different views and attitudes have appeared since the broad masses of cadres began to study economic theory last year in accordance with the arrangement of the Propaganda Department of the CCP Central Committee. Some comrades find it difficult to understand Marx' theory of reproduction, while others still have doubts about the necessity of studying theory. We must admit that for those comrades who have a lower educational level and poor theoretical basis, it is really not so easy to study economic theory, and guidance is quite necessary for them to overcome difficulties. Nevertheless, we should not have any doubts about the importance of studying reproduction theory for the broad masses of cadres, especially those in leading positions and those who are in charge of economic work. The theory of reproduction is an important component part of Marxist political economics. It is not only an ideological weapon for understanding the law of development in capitalist society, but also an indispensable theoretical guidance for organizing and leading socialist economic construction. One of our past lessons in economic construction is one-sidedly emphasizing high speed and high accumulation and promoting a scale of capital construction which is beyond the capacity of our financial and material resources. These factors caused the serious disproportion of the national economy. At the same time, we interfered too much and were too rigid in economic management, and our actions ran counter to the objective law of economic development in many respects. All this is a result of insufficient study and understanding of the theory of reproduction. Just as a comrade who studied reproduction theory at a party school said: If we had begun our study 20 years earlier, we might not have made so many serious mistakes and had so many problems. This implies a deep understanding of our past experiences and lessons and shows, at the same time, the importance of studying the theory of reproduction.

Can we master the theory well? How many things can we learn from our study? We can find the answer in both Jiangxi and Guangxi's experiences. Of course, it takes time and energy to master the theory well. As to whether or not we can learn a lot, that depends on whether there is good guidance. Without guidance, it will be difficult to study the theory and the results will be affected. However, if the CCP committees pay enough attention, strengthen leadership and create conditions to push forward our study, the difficulties can also be overcome. This is one of the experiences in the two provinces as well.

There are many good experiences in various localities on the study of economic theory by cadres. We hope that they will sum up and exchange experiences among themselves so that the study will be pushed forward and more achievements will be scored.

WHAT CADRES HAVE GAINED FROM STUDYING THE THEORY OF REPRODUCTION

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 36-37

[Article in "Theoretical Study by Cadres" column by the Propaganda Department of the Jiangxi Provincial CCP Committee]

[Text] In carrying out economic theoretical study, our province has decided to conduct study sessions on the book "Study Marxist Theory of Reproduction" fot 5,460 cadres at the county level and above. In 1981, 3,670 of these cadres had completed their study, while the rest are expected to basically complete their study in March of this year.

There has been a good response to the study of this book. Prior to their study, a considerable number of the cadres were not aware of the importance of studying this book. They said: "Since we are carrying out socialist construction today, why is it necessary for us to study 'Das Kapital,' which was written by Marx over 100 years ago?" "Is this not divorcing theory from reality?" In the first 5 to 7 days of their study, the participants generally found the going "rough" and they could neither understand the definitions nor grasp particular viewpoints. But, as the members of the standing committee of the provincial CCP committee took the lead in the study, they all decided to continue their study whatever the cost. Their efforts were at last rewarded. In a matter of 5 to 7 days after beginning their study, they began to understand the book, and the more they studied the more interested they became. They studied very hard. At the end of their study, they generally felt that the time was too short and they asked to have it lengthened. They came to realize that it is necessary to read classical works and that they can understand these works if they decide to study hard. They hope to be able to have more such courses in the future.

Those comrades who have completed their study and made achievements can be generalized as the following:

First, they have understood the basic principle of Marxist political economy. Many leading cadres above prefectural level in our province did not study political economy systematically, and this was their first complete reading of a classical book. They found the book to be fresh and impressive although it only contained excerpts of lengthy writings. They said that after 1 month of study, they had not only covered a classical book, but also understood such basic economic principles as the circulation and turnover of capital, the reproduction of social gross capital and the flow of capital. In addition, through this study they were able to "link together" systematically the fragmentary knowledge they had gained through their own self-study over the years, deepened their understanding and improved their economic theoretical level.

Second, they deepened their understanding of the party's principles and policies for readjusting the national economy. Many comrades did not have enough systematic knowledge of Marxist political economy and thus failed to correctly understand the principles of readjustment, restructuring, reorganization and upgrading that has been formulated since the 3d Plenary Session of the 11th CCP Central Committee. Some were even doubtful and asked themselves, "Is this really Marxism?" Following their study, they understood that many of the principles and policies advocated by the CCP Central Committee are in line with the Marxist theory of reproduction. Some comrades said that they did not understand why the readjustment of the national economy requires such a considerable amount of time. Now they have come to understand that the general guiding ideology has caused a serious imbalance in the proportionate relations between the two big economic categories and such a situation cannot be corrected in a short period of time. Many comrades said that they now understand even more deeply the party's line, principles and policies that have been formulated since the third plenary session.

Third, they have deepened their understanding of the importance of theory and theoretical study. Because of the interference and sabotage of Lin Biao and the "gang of four," the broad masses of cadres, in the past few years, have developed many misunderstandings with regard to theory and theoretical study; they thought that "theory was useless" and consequently, they were unwilling to undertake any study. But following their study this time, many comrades have changed their understanding and attitude. They said, "It is not because theory is useless but because we did not study theory well enough." Some comrades came to know that Engels once said that "Das Kapital" was often referred to as the "bible for the working class." He also said: "We are so sorry that we failed to read 'Das Kapital' after joining the revolution and the party decades ago, and this situation cannot be justified; it must be read by the working class." Following their study, many comrades became aware of the practical significance of the Marxist theory of reproduction in realizing the modernization program. They have consequently been able to see things more correctly and they have found that they have enriched their knowledge. Many comrades have combined their theoretical study with the summing up of their experiences. They have written on their understanding of some principles that are easier to grasp, such as how to scientifically make use of funds, step up the turnover of the funds and actively tap potential in intensively expanding reproduction. They have also expanded their understanding of these questions to improve their knowledge.

Considerable achievements have been made in the study not only because of the attention paid by the party committees at various levels but also because the organization, leadership and method of study have been improved. Many units have resorted to the method of "small centralization" in the interest of strengthening leadership and providing coaching in the study to the cadres so they can concentrate their efforts and time on study. As the time for study was too short and the participants, in general, found it difficult to read the book because of their weak foundation, many units generally resorted to the study method of combining reading with coaching and discussion. They stressed that all participants must "begin by reading original writings" and read them at least 2 to 3 times. For many cadres it has been very difficult to start their study without help from instructors. Therefore, beginning in November 1980, measures have been taken by the provincial departments down to localities to train theoretical instructors and compile and print coaching materials. Coaching is carried out by an instructor reading out loud the main passages, explaining the main points of each chapter and section in order and systematically, while the main points, difficult points and points on which there are differing views are explained in detail through basic principles. The purpose of coaching is to help understand the book, master the basic contents, and point out the direction for combining study with reality. It was also necessary to have discussions, but they could not be carried fully because of the limited time. Therefore, the participants deepened their understanding by exchanging views among themselves. In order to make greater achievements in the limited time, it was necessary to organize the discussions well.

A number of good study situations have developed for the first time because we began theoretical study in 1981. But there is room for improvement in our work and a number of problems still exist. Some regions and units still believe that it "makes no difference whether we study or not" and thus they are passive and reluctant to undertake studying. While other places and units have not even started the study. Our coaching ability is weak. Although our instructors have worked hard, they still cannot carry out their coaching task well. The provincial CCP committee has decided to restore its lecturer group and strengthen the coaching ability so as to create better conditions for cadres in their study. Some units have failed to handle well the relations between political study and theoretical study, which has slowed the pace of the study. All these problems must be overcome and the study situation improved.

EVEN LEADING CADRES OF COUNTIES AND COMMUNES CAN MASTER THE THEORY OF REPRODUCTION

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 37-38

[Article in the "Theoretical Study by Cadres" column by the Theoretical Education Office under the Propaganda Department of the Guangxi Zhuang Autonomous Region CCP Committee]

[Text] The Mashan County CCP Committee organized three study courses on the Marxist theory of reproduction in the county party school from mid-May to the end of September 1981. Participating in the courses were 108 cadres at the level and above of county department and bureau directors and senior leading cadres of people's communes. After the courses were concluded, the participants said that they had made achievements in their study, and these are mainly shown in the following:

First, they have deepened their understanding of the principle of national economic readjustment. Prior to their study, some cadres, particularly the comrades from the industrial and communications system, did not really understand the significance of the readjustment, or they felt that it was necessary to readjust the national economy but they could not tell why. Following their study, they came to understand that not only must the two major categories develop in balance, the inner relations of these categories must also develop harmoniously and that if they are out of balance, they will consequently hinder the smooth development of social reproduction. The director of the county finance office said: "Carrying out production is just carrying things with a shoulder pole: if one end of the pole is heavy and the other end is light, we will not be able to walk. In the past, we stressed the importance of primarily developing heavy industry to such an extent that we spoiled the balance of the two major categories; such a practice runs counter to the Marxist theory of reproduction. If we do not readjust the proportionate relations among various departments, we will continue to cause enormous waste in our economic construction." Some factories and mines that had to be closed down refused to do so; but after gaining an understanding of the above-mentioned principles, they fairly cheerfully complied with the decision of the county.

Second, they have further paid attention to economic results. A deputy secretary of the county CCP committee did not really understand the importance of improving economic results, which is necessary for guaranteeing smooth reproduction. Therefore, in building the "five-small" industry, he neglected economic results and developed the industry blindly. When production could not be carried out normally, he was at a loss as to the reason. Following his study of the theory of reproduction, he has deepened his understanding of developing the economy through low investments with high economic results. He also came to understand that the core of the previous problem was that he did not pay enough attention to economic results. Thanks to their study, the comrades from the county forestry department understood that a reason for their loss was that the proportion of their fixed assets was too high, with idle funds amounting to as much as 250,000 yuan. When they finished their study and returned to their unit, these comrades rapidly readjusted the assets. The director of the county's light industrial bureau further understood that flows of funds will help promote production and, therefore, he became more active in smoothing channels for the flow of goods and in promoting the development of production. When he was solving the problem of serious overstocking in a county winery, he carried out deep investigations and found that, following measures taken by the commercial department to change the method of unified purchasing and fixed sales quotas, the winery leadership did not pay attention to smoothing out channels for the flow of products. He then helped the winery to sell its products and solved the problem of production being divorced from sales. In 1981, this winery overfulfilled yearly production quotas.

Third, they have deepened their confidence in the leadership of the CCP Central Committee and the State Council. Prior to their study, some comrades misunderstood the road for a Chinese-style modernization program that has been put forth by the CCP Central Committee and the State Council. But, following their study, these comrades understood that under the influence of the "leftist" guiding ideology prior to the 3d Plenary Session of the 11th CCP Central Committee, many policies and measures ran counter to the Marxist theory of reproduction to enhance national economic imbalance. They have now come to understand that the principles and policies put forth by the CCP Central Committee and the State Council for economic work are in line with the Marxist theory of reproduction and our national conditions. They said with confidence that it is true that with the current principles and policies the pace of the current development will be slowed, but if we are able to continue to implement these principles and policies, our economy will develop faster once our economic work is carried out smoothly.

The study courses in the theory of reproduction held by the Mashan County CCP Committee has made better achievements thanks to the hard study of the participants. In addition, there are two other reasons for the achievements.

Primarily, the county CCP committee has paid much attention to and strengthened its concrete leadership. Senior leading cadres in the county joined the courses in turn and they took timely measures to solve the concrete problems in the course of the study, such as providing additional expenditures for the party school and drawing up lists of the leading members that were to take part in each term of study so as to guarantee that the courses would be carried out according to plan.

In addition, the teaching was carried out by proceeding from reality. The cadres from the county CCP committee understood that most participants have a low theoretical level and that it was, therefore, difficult for them to read the original works. Therefore they used three articles in the study of the Marxist theory of reproduction as the main teaching materials. In addition, comrades from the propaganda department and party school also compiled some reference materials for the participants while instruction was given to help them overcome stumbling blocks. The comrades from the county CCP committee also led others to combine their study with their past experiences and lessons in economic construction, with the party's principles and policies and with the measures that have been issued and taken since the 3d Plenary Session of the 11th CCP Central Committee and with the economic work of their own units. This method has proved very effective. The participants said that in the beginning of their study, some expressions and concepts were strange to them, but when they deepened their study, they found that many of the concepts were not difficult to understand. They said that the more they studied, the more useful they felt the roles of these concepts to be and the more interested they became in the study.

WHY MUST THERE BE A CEILING ON THE ISSUING OF BONUSES?

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 39-40

[Article by Fu Rong [5958 2837]]

[Text] As bonuses are payment for extra work, the amount issued is decided by the amount of extra work, and no restriction on issuing them in the first place is necessary. But there must be some preconditions to ensure that the bonuses are actually rewards for extra work. One of these important conditions is that work quotas should be reasonable and progressive. They should be standards that most people can attain or surpass through efforts within a given period of time. This means that only some of the workers can overfulfill their quotas and the amount of their overfulfillment is not large. There should only be a few who can overfulfill their quotas by a wide margin. They are the advanced elements and generally those who are inventive and can carry out technological renovation. If most people can overfulfill their quotas by a wide margin without effort, this only indicates that the work quotas are set at unreasonably low levels and should be revised. When work quotas are reasonable and progressive, the number of people who can do extra work and the amount of extra work they do are certain to be limited, and thus bonuses are also limited. However, at present, administrative systems in many enterprises have not yet been perfected. Particularly, there are still a large number of problems in quota controls. In some enterprises, no work quotas have been set. Extra work in these enterprises often does not reflect the true situation, and the amount of bonuses issued is much greater than the actual amount of extra work. In order to make bonuses really reflect extra work and to eliminate the excessive issuing of bonuses, first of all, the control of work quotas should be handled well. Before this problem is solved well, it is necessary to limit the issuance of bonuses.

The measures for implementing the economic responsibility system in enterprises, linking bonuses with profits of an enterprise and reserving bonus funds from profits proportionally, are conducive to overcoming egalitarianism. However, since the people-owned economy is a single entity, in a given period, the state has to make overall planning for the amount of funds which can be used for issuing bonuses according to the existing level of social production and productivity growth. That portion of an enterprise's income reserved for itself cannot be excessively large and the portion for individuals cannot grow too fast. Otherwise, the state's financial revenues will be adversely affected, thus reducing the sources of state accumulation, slowing down state construction and industrial and agricultural production, and in turn adversely affecting the improvement of workers' livelihood. Since 1980, the nationwide bonus growth rate has exceeded the growth rate of production, productivity and profits. This state of affairs must be remedied. Particularly in the current period of national economic readjustment, for the sake of overcoming the state's financial difficulties and rapidly improving the national economy, the state cannot be expected to spend more money to improve the people's livelihood. It was proceeding from this overall situation that limits to the amount of bonuses issued were placed on the enterprises. It was in the fundamental interests of the broad masses of workers. Some comrades felt that only their enterprises had gained more profits, thus demanding that more bonuses be issued. This showed that they lacked an overall point of view.

Wages and bonuses constitute the monetary income of workers and also the social purchasing power. A balance should be maintained between social purchasing power and the available supply of social commodities. If purchasing power grows too fast and the growth of commodities supply cannot keep pace, commodity price hikes will result. In order to avoid this phenomenon, the growth of social purchasing power should be in line with the coordination of state plans. Restricting the issuance of bonuses is one of the ways in which state planning can adjust consumption. Bonus funds do not take the form of bonuses which are paid out to the individuals once and for all. Bonus funds can be turned into reserve funds, which can be used to make up for some future shortages of bonus funds and can also be turned into welfare funds. This will be conducive to reducing the pressure of individual purchasing power on the markets and at the same time will benefit the workers.

When a ceiling on the issuing of bonuses is set, this does not mean that all the enterprises should issue bonuses up to the maximum set by the ceiling, still less does it mean that all the workers can get their bonuses under the same standard. It is correct to issue bonuses in enterprises which are managed and operated well, but poorly managed enterprises should issue fewer bonuses or even stop issuing bonuses. As for the bonuses issued to the individual workers, it is necessary to control them within the limits and to issue the bonuses exactly according to extra work. So long as ideological and political work is strengthened, and the principle of distribution according to work is effectively implemented, the limited bonuses can surely play a greater role.

CSO: 4004/23

IS IT IN CONFORMITY WITH THE PRINCIPLE OF DISTRIBUTION ACCORDING TO WORK TO CONSIDER ALL SIDES WHEN ISSUING BONUSES?

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 40-41

[Article by Zong Han [1350 1383]]

[Text] Whether an enterprise draws bonus funds and the amount of these funds depend on how much above-quota labor it can offer to society after fulfilling the state plan. If it can overfulfill the state plan and provide extra labor, it can have bonus funds; otherwise, no bonus funds are available. Within an enterprise, things are the same. The availability and amount of a bonus for a worker depend on the amount of his above-quota labor. The more above-quota labor he provides, the greater the bonus he can get; but if he does not provide any above-quota labor, he gets no bonus.

Then, why should the interests of related enterprises be considered when bonuses are reserved by an enterprise and issued to its workers? The main reason lies in the fact that the above-quota profits of an enterprise, although they embody above-quota labor, are not created merely by the workers in this enterprise alone. There are many factors which can affect the profits of an enterprise. They include the following:

At present, prices of some products in our country are not reasonable. Prices of some products are higher than their real value, resulting in comparatively high profit rates. Other products are in a reverse situation; their low prices lead to low profit rates or even losses. For example, the profit rate of power industry funds in our country is about 13 percent, while the profit rate of coal industry funds is only 2 percent. In 1978, the production cost for raw coal under unified distribution was 16.34 yuan per ton, but its selling price was only 15.96 yuan. This resulted in a loss of 1.67 yuan per ton after taxes were deducted. After ex-mine coal prices were increased by an average of 5 yuan per ton in 1979, two-thirds of the coal mines still continued to incur losses. Owing to the low price of coal, power stations can reap a profit of 34-51 yuan with the consumption of 1 ton of coal. The profit rate of power industry funds is high, but that of the coal industry is low. Some coal mines even incur losses. Does this mean that the workers in the power industry have supplied above-quota labor and that this corresponds to the profit rate in this industry, or that the workers in the coal industry have not supplied any above-quota labor or have not even fulfilled their quotas? It is not correct to draw such conclusions. The large gap between the profit rates of these industries is caused to a great extent by the price factor. Owing to the low price of coal, the value created by the coal workers, including that part created by their above-quota labor, has been transferred to and realized by those coal-consuming enterprises. A similar state of affairs exists in the production of other products. Therefore, when bonuses are reserved and distributed in those enterprises which have gained higher profits owing to the low prices of their raw materials and fuel and to the high prices of their products, they should not just consider how much above-quota profit they have made. Instead, they should also consider where this above-quota profit comes from. That is to say, consideration should be given to those enterprises which have actually contributed above-quota labor but which, because their prices are unreasonable, have made low profits. Only in this way can the principle of distribution according to work be implemented well; without this mutual consideration, the principle will be violated.

Enterprises differ greatly from each other in the aspects of geographic position, equipment and degree of coordination. In raw materials industries and the mining industry, natural conditions (reserves of natural resources, their grades and the degrees of difficulty in exploitation) also differ greatly. Enterprises that are well-equipped, well-located, close to sources of raw materials and have good natural conditions can generally make higher profits with the same amount of labor than those under comparatively adverse conditions. But the objective conditions are not entirely determined by the enterprises themselves. Above-quota profits made by enterprises which have favorable conditions do not always indicate that the workers there have supplied equivalent above-quota labor. On the other hand, above-quota labor in those enterprises, the conditions of which are worse, sometimes reaps no superprofits. Take, for example, two chemical plants, one with advanced equipment and in which, on average, each worker can utilize fixed assets of 30,000-40,000 yuan; and the other, poorly equipped with an average fixed assets utilization by each worker of less than 10,000 yuan. With equipment of different technical levels, workers will create different amounts of use value while putting in the same amount of labor. In other words, unit products with different production costs but sold at the same price will result in different profits and above-quota profits for the enterprises. Our enterprises are socialist enterprises. Generally, the equipment in the enterprises is provided by state investment. That is to say, the objective conditions with which those well-equipped enterprises can make above-quota profits are mainly created by the state and all the workers of the society. In addition, at present there are still no fixed capital utilization taxes or resource disparity taxes imposed on enterprises in our country. Therefore, above-quota profits of an enterprise do not exactly reflect the amount of above-quota labor supplied by workers of the enterprise. Thus it is necessary to take those enterprises which are poorly equipped but which have supplied extra labor into consideration when bonuses are drawn and issued. Mutual consideration should also be given in cases where natural conditions and other external objective conditions differ between the enterprises. This is in conformity with the principle of distribution according to work.

When we encourage people to consider all sides when issuing bonuses, we should also prevent that kind of egalitarianism in which bonuses of all enterprises are made the same. If enterprises have provided the society with different amounts of above-quota labor, it is absolutely reasonable for certain variations to exist when bonuses are drawn and issued among them.

THE 320TH ANNIVERSARY OF THE RECOVERY OF TAIWAN BY ZHENG CHENGGONG

Beijing RED FLAG in Chinese No 3, 1 Feb 82 p 41

[Historical data by Li Hong [2621 1347]]

[Text] This year 1 February marks the 320th anniversary of the successful expulsion of Dutch aggressors and the recovery of Taiwan by Zheng Chenggong, an outstanding national hero in Chinese history.

Taiwan has been an inalienable part of China from time immemorial. However, it was forcibly seized and occupied by the Dutch aggressors in 1624 (the fourth year of the Tianqi period during the reign of Emperor Xi Zong of the Ming Dynasty). The Dutch aggressors exercised brutal colonial rule over the island and plunged the local people into the abyss of suffering. With a view to driving away the Dutch aggressors and recovering the treasure island of Taiwan, Zheng Chenggong set off from Liaoluo Bay on Jinmen Island with an army of 25,000 men on 21 April 1661. After passing Penghu Island and surmounting numerous difficulties at sea, they victoriously hit the beach in southern Taiwan on the morning of 30 April. On the same day, with the positive support and help rendered by the local people, Zheng Chenggong swiftly foiled the stubborn resistance put up by the Dutch aggressors both at sea and on land and immediately laid siege to the important stronghold of Kanchien city (today's Tainan), forcing the city's commanding officer to surrender. After this, Zheng Chenggong laid siege to another stronghold called Taiwan city (today's Anping) while proceeding to recover other lost territories. Tei Kokukyo, the Dutch-appointed viceroy of Taiwan, tried to lure Zheng Chenggong into abandoning his determination to recover Taiwan with the promise of tribute and money. However, Zheng Chenggong said: "Taiwan has been run by the Chinese people since ancient times. It is a Chinese territory although it has been occupied by your country all these years. Now I have come to claim it back and the land should belong to me." This shows his determination to recover the territory of his motherland and reflects the glorious tradition of the Chinese people in resisting foreign aggression and safeguarding national sovereignty. After fighting valiantly for 9 months, Tei Kokukyo was forced to surrender on 1 February 1662 due to the lack of reinforcements. Thus, Taiwan, which was occupied by the Dutch aggressors for as long as 38 years, was finally returned to the embrace of the motherland.

The recovery of Taiwan by Zheng Chenggong goes down in the annals of Chinese history as a brilliant victory in the struggle against aggression. It is of great historic significance. Today, we must continue to carry forward Zheng Chenggong's patriotic spirit and strive to bring about the return of Taiwan to the motherland and fulfill the great cause of reunifying the motherland.

WHAT SHOULD BE OUR ATTITUDE TOWARD THE PARTY'S MAKING MISTAKES?

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 42-45

[Article by Li Mingsan [2621 2494 0005] and Guo Dehong [6753 1795 1347]]

[Text] Guiding the Chinese people in carrying out socialist revolution and socialist construction over the past 32 years, our party has scored remarkable achievements and at the same time, it has made mistakes, particularly mistakes such as the "Great Cultural Revolution" which has had a long-term and overall significance. How to correctly view our party's committing mistakes has become a very important question. By means of studying the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC" adopted at the sixth plenary session, the broad masses of party members, cadres and people have been educated and encouraged to adopt a positive approach to help the party sum up historical lessons and be united to struggle for realizing the four modernizations. However, some comrades hold a different attitude. Whenever they see that the party has made mistakes, they begin to lose their confidence in the party's ability to lead the people to construct a strong and prosperous state and even spread the passive attitude of waning confidence among the people. Some of them even go as far as to exaggerate the party's mistakes and allege that they manifest the main trend of the party's work. There are some others who willingly vilify the party, claiming that it has made mistakes in order to shake off party leadership. These questions are worth great attention, and we should seriously deal with them.

Marxism tells us that it is unavoidable for any individual or any political party to make mistakes. There has never been a political party which is free from mistakes. Whether a political party is great, glorious and correct does not depend on whether or not it has made mistakes but on what mistakes it has made and what attitude it has taken toward the mistakes. In other words, we must first make clear the nature of the mistakes. In a broad sense, there are two kinds: First there are those which people make in propelling history forward and which are correctable. Second there are those which people make in achieving their reactionary goal to prevent history from advancing, and which are irremediable. In order to safeguard their own reactionary rule, the exploiting class rulers in successive dynasties, when trying to put the clock back, opposed the people by every means. Their mistakes were irremediable and they were bound to be destroyed. The mistakes which our party made are completely different from theirs. As ours are the ones which emerged in the course of advancing and probing, they can be corrected as soon as they are found. It is very important to classify mistakes by their nature. In talking about Luxemburg's shortcomings and mistakes, Lenin quoted a fable by Krylov which pointed out that an eagle sometimes flies even lower than a chicken, whereas a chicken can never fly as high as an eagle. Lu Xun also said: "A fighter with shortcomings remains a fighter, while a perfect fly is after all nothing more than a fly." ("Collected Works of Lu Xun," Vol 3, p 30) All these metaphors can be applied to the case of our party as well. Being an old man who has witnessed the rise and fall of several dynasties and has rich experience, Hu Juewen, vice chairman of the Standing Committee of the National People's Congress, talked about the mistakes of our party in the light of his own experiences obtained in both the old and new societies. He said: "There is no doubt that the CCP and the people's government have made mistakes; however, compared with what the rulers of old China had done, the nature of their respective mistakes cannot be mentioned in the same breath. What especially gratifies, moves and inspires us is that the CCP and the people's government, after having summed up and taken lessons from past experiences, distinguished right from wrong in their guiding ideology, are taking a more and more conscientious attitude toward the shortcomings and mistakes emerging in the course of work." His is an objective and fair appraisal.

In the second place, we must make clear whether the mistakes were the principal or secondary aspect of our party's work. If on the whole, what a party has not done are not good deeds but has made mistakes and it has brought not welfare but catastrophes to the state and the people, of course it can hardly be called great, glorious and correct. Nevertheless, the mistakes which our party made were only in the secondary and minor aspect of its work, and the great achievements that our party made during the period of democratic revolution are extensively recognized all over the world. Although we have made quite a few mistakes during the last 32 years since the founding of the PRC, the achievements we have made were the principal aspect of our work. We have successfully eliminated the system of exploitation, established the socialist system and thus completed the most profound and greatest social change in our country's history. From the shambles left by old China, we have built up step by step an independent and relatively complete industrial system and national economic system. In 1980, the total industrial output value increased by 34.7 times and the total output of grain increased by 1.8 times over 1949. Although we carried out a large-scale economic readjustment in 1981 and also suffered from serious natural disasters, the total industrial output value still increased by 4 percent over the previous year. Last year's grain production was the second highest since the founding of the PRC. Although our country's population is close to 1 billion, and our cultivated land amounts to only 7 percent of the world total, we have still managed basically to guarantee the food and clothing needs of a population which is close to one-quarter of the world's total relying entirely on our own strength. We must say, this is a really amazing achievement. We have also made great developments in the fields of education, science, culture, public health, physical culture and sports and so on. Our achievements in scientific fields such as nuclear technology, satellites and carrier rockets, and so on have in particular drawn the world's attention. These are not only miracles in our country's history but also in the world's history. Undoubtedly, these achievements are primary; and in contrast to them, the mistakes which our party made are after all secondary.

In the third place, we must make clear what attitude our party has taken toward the mistakes. Lenin said: "The attitude of a political party toward its own mistakes is one of the most important and surest ways of judging how earnest the party is and how it fulfills in practice its obligations toward its class and the toiling masses. Frankly admitting a mistake, ascertaining the reasons for it and thoroughly discussing the means of correcting it--that is the earmark of a serious party." ("Selected Works of Lenin," Vol 4, p 213) Always taking a practical and realistic attitude toward its mistakes, our party never covers up facts or evades problems. It dares to expose itself and is brave and active in correcting its mistakes. Back in the period of the war of resistance against Japanese invaders, our party mobilized the masses, ranging from high-ranking cadres to all party members, to take part in the rectification movement which thoroughly cleared away the prevailing influence of leftist doctrinairism. This rectification movement, which laid down an ideological foundation for the victory of the war of resistance against Japan and the war of liberation, has always been commended inside and outside the party and this time, in redressing the leftist mistakes made before and during the "Great Cultural Revolution," our party has not only mobilized the whole party but has also extensively and thoroughly mobilized hundreds of millions of people to engage in exposure and criticism. This is an unprecedented undertaking in the history of the international communist movement. This is an action which shows our party's strong sense of responsibility to the people's cause and its firm confidence in its own strength and in the future of the socialist cause which it leads. Only a party which is armed with Marxism-Leninism-Mao Zedong Thought and which represents the fundamental interests of the people can take such an action.

Of course, it was really distressing to see our party make mistakes and thus bring about serious damages to the revolutionary cause and great misfortunes to itself and the people. But the mistakes taught the party and the people. In talking about the mistakes of the "Great Cultural Revolution," Comrade Zhao Ziyang said that from a certain point of view, if there had not been a "Great Cultural Revolution" in which all extremist practices were promoted, we would not have been awakened as thoroughly as we are today, we would not have reexamined all the problems since 1957 and could not have been as liberal as we are today for a long time to come. It is in experiencing mistakes and setbacks that we have managed to become coolheaded and more mature; and it is through the practice of correcting mistakes that we have become firmer and stronger. This has been proved by facts. Doubting the party or even trying to get rid of the party's leadership just because the party has made mistakes is not only wrong but will also bring about more serious mistakes. Comrade Hu Qiaomu pointed out: "The party's leading body did make mistakes but nobody is allowed to use this as a pretext to weaken, cast off or destroy the party's leadership, since doing so will only lead to terrible catastrophe."

Since our party has made mistakes, will it still be able to undertake the important task of leading the people in building a prosperous and powerful socialist country? In our opinion, this problem is not a theoretical one but rather a practical one. Since the third plenary session, our party has taken a series of resolute and correct measures to redress the mistakes, and thus brought about an excellent situation unprecedented in the last 20 years. This fully proves that our party is absolutely up to its task.

In terms of guiding ideology, leftist mistakes have brought about the most serious damage to the socialist cause since the founding of the PRC. Our party is very determined to redress this mistake and has devoted much effort to this. Because the "leftist" mistakes have been dominant for a rather long period--in particular, the longstanding personality cult of Comrade Mao Zedong and the doctrinairist habit of blindly copying certain speeches of Marx, Lenin and Comrade Mao Zedong; which enabled the "leftist" guiding ideology to dominate the whole party and go deep into every domain--a number of people made "leftist" thinking a criteria in judging the situation and in taking action; and thought that this thinking conformed with Marxism-Leninism-Mao Zedong Thought. Since the smashing of the Jiang Qing counterrevolutionary clique, many comrades inside the party have strongly called for the redress of such "leftist" mistakes. However, as the "two whatevers" were put forward and upheld, the "leftist" mistakes have continued to exert influence. This shows that it is not an easy task to redress the "leftist" mistake. In a certain sense, it is even more arduous and difficult than the task of redressing the leftist adventurism of Wang Ming in the past. As the representative of the people's fundamental interests, our party will never be overwhelmed by any difficulty. From painful lessons our party has learned the truth that it and the country will not make any progress and the socialist cause is likely to be destroyed, if the "leftist" mistakes are not redressed. Therefore, the party has devoted much effort to redressing its own mistakes. The general guiding principle of emancipating the mind, using one's brains, taking a practical and realistic attitude and uniting to strive for the future, was established at the third plenary session. It enabled the party to comprehensively redress its own mistakes, carry forward and further develop the scientific system of Mao Zedong Thought, restore the original face of Mao Zedong Thought and thus reestablish the party's ideological guideline on a scientific basis of dialectic materialism. At the same time, the party has accordingly readjusted and changed all the past evaluations of situations, theories and points of view, political slogans, guiding principles and policies which did not conform with objective reality. It has also revised and made, based on Marxism, a new and correct explanation and some decisions which conform with the objective reality for all important and new problems emerging in the realms of politics, economy, culture, social life and so on. The "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC" has made in particular a comprehensive, practical, realistic and scientific analysis of the "leftist" mistakes, thus fulfilling the party's historical task of setting to rights things which have been thrown into disorder in the realm of guiding ideology. It has thus established a correct road, which conforms with our national conditions, to construct a powerful socialist country. All these facts show that our party is one which is not only earnest in correcting mistakes but also adept at learning lessons from mistakes.

The main reason our party could successfully fulfill such an arduous task is that it possesses a strong central leading group which guarantees the implementation of the correct Marxist line adopted since the third plenary session. The existing leading core of the CCP Central Committee has been shaped since the third plenary session. In this group, we have some proletarian revolutionaries of the older generation who have stood the test in the long-time revolutionary struggle and are enjoying a good reputation. With rich and overall experiences in all fields of politics, economy, culture, military and so on, they are the mainstay which ensures the smooth implementation of the process of setting to rights things which have been thrown into disorder, as well as the success of the cause of the party and the people. In this group, we also have those comrades who are in the prime of life and possess rich practical experience. They have made important contributions in restoring and reestablishing the party's ideological and political lines, in reversing unjust, false and wrong verdicts, in carrying out the party's policies, in promoting the national economy and so on. Working together, all these comrades can help each other and complement each other. The high sense of responsibility to the people which they have shown in collectively handling major issues has set a good example for leading organizations at all levels. Therefore, it can be seen that the present leadership group of the CCP Central Committee has become more energetic and has improved its ideology, work style and so on, as compared with the past. It is now a strong and united leadership group. Comrade Tan Zhenlin, proletarian revolutionary of the older generation, said: The profound changes in various fields since the third plenary session are enough to show that "the present leading core of the CCP Central Committee is a strong leadership group which is absolutely trustworthy." This is a very appropriate appraisal. Under the leadership of this CCP Central Committee, we will be able to redress our mistakes; and we can be certain that we will overcome all difficulties and thus lead our socialist cause from one victory to another despite tremendous obstacles in the course ahead. As pointed out by Comrade Deng Xiaoping: "We will be able to concentrate the strength of the whole party or even the strength of the whole country to accomplish marvelous deeds so long as our party's leadership remains correct."

The history of modern China has shown that only the CCP can redeem the people from untold miseries, lead them to overthrow the three big mountains and win independence, freedom and liberation. Without the CCP, there would be no new China. This is a conclusion drawn from history. Now the history of the last 32 years shows once again that without the CCP, there will be no modernized socialist China. The party can hardly avoid mistakes in exercising leadership. However, in closely uniting with the people, it can surely redress mistakes and successfully lead the people throughout the country to turn our homeland into a prosperous and powerful socialist country. Therefore, there is nothing to worry about, and there is no reason for us to lose our confidence.

In the eyes of some other comrades, the CCP still has certain defects, such as the existence of unhealthy trends. They are worried about whether a party like this can properly lead the socialist construction. It is true that certain unhealthy trends, some of which are serious, exist among some of our party members and cadres who practice bureaucracy, seek personal privileges, make use of the power which the people grant them in seeking private interests. Unhealthy trends like these are a kind of corrosive. They can corrupt our cadres, party members and the party, destroy the flesh-and-blood ties between the party and the people, go against the fundamental interests of the people, deprive the party of combat strength and endanger the construction of the four modernizations. It is completely understandable that the broad masses of the people are discontented with such a situation. However, it should be noted that the situation did not arise from mistakes in the party's guiding ideology but from problems existing among some party members and cadres. We can be certain that the party will be able to redress the unhealthy trends existing among these party members and cadres since it has dauntlessly admitted and corrected its mistakes in guiding ideology. We should have a correct understanding of these unhealthy trends existing inside our party.

First, numerous historical facts have proved that most of our party's cadres are good or relatively good and completely trustworthy. Those cadres who are contaminated by unhealthy trends represent only a small part. If this is not our appraisal and understanding of the situation, we will not be able to understand the reason why the party managed to redress its mistakes and win the support of the masses of the people in the last few years, and we will be puzzled in witnessing the rapid favorable turn of the situation and the splendid achievements in the fields of politics, economy, culture and so on.

Second, unhealthy trends such as bureaucracy, seeking personal privileges and private interests, and so on are expressions of the old society's ideologies which serve the exploiting system. They certainly have to be overcome and eliminated under the socialist system. However, there are still some old elements left over from the past which keep exerting an influence on the people since the socialist system is a new one with a short history. After our party seized political power, a change occurred in certain people's thinking. They forgot or even discarded the party's fine tradition and work style and adored and contracted bad habits of the old society. Due to the evil practices of the Lin Biao and Jiang Qing cliques, the remnants of feudalism, the bourgeois thinking, anarchism and out-and-out egoism were on the upsurge during the 10 years of turbulence, and thus the thinking of a number of party members and cadres was seriously corroded. All these unhealthy trends are, Marx put it, the "vestiges" of the old society. They will eventually be overcome by the highly developed material and spiritual civilizations which are to be established in our country.

Third, the CCP is the vanguard of the proletariat and a party which serves the people wholeheartedly without seeking any private interests. This characteristic determines the party's resolute attitude in opposing privileges, bureaucracy and various unhealthy tendencies. Our party never praises, supports and appeases the small number of people inside the party who are contaminated by unhealthy trends, but unremittingly criticizes and educates them. As pointed out by Comrade Hu Yaobang, "various evil things exist at present and will remain for quite a long period of time in the future in the socialist society. There is nothing unfathomable about this. However, the socialist society cannot tolerate the roots of trouble left by the old society. Our party always claims that we will struggle against those wrong, evil practices and unhealthy trends by mobilizing and depending on the broad masses of the people." While a great number of problems are waiting to be handled since the smashing of the "gang of four," our party has listed right away the rectification of the party's work style as a priority item on the agenda. We have established discipline inspection commissions at all levels from central to local, worked out and promulgated the "Guiding Principles for Inner-Party Political Life," set some necessary regulations governing the living conditions of high-ranking cadres, disclosed, criticized and seriously handled some cases of severely unhealthy trends, of which only a few have been published in newspapers. Recently, our party also put forth the task of resolutely simplifying the leading organs of the party and state at all levels and overcoming bureaucracy, so as to bring about within this year a favorable trend of decisive importance toward improvement of the party's work style. All these facts show that our party is conscientiously redressing the unhealthy trends, just as one removes dirt from a healthy body. Being relatively impetuous, some comrades are itching to redress all unhealthy trends overnight. Their desire is fine but impractical. We need to go through a whole process to clear away all vestiges of several thousand years. As long as we strive unremittingly and persistently with one heart and one mind and give full play to tenacious combat spirit, we will surely be able to cure the persistent sequelae derived from the old society.

Lenin said: "If we are not afraid of admitting our mistakes, not afraid of making repeated efforts to rectify them--we shall reach the very summit." ("Collected Works of Lenin," Vol 33, p 182) In view of this, it is very wrong to spread words casting doubt on the party, and thus undermining confidence in the party's leadership, under the pretext that the party has made mistakes and there are still unhealthy trends in the party. The only right attitude a revolutionary should take is to treat the party's mistakes and shortcomings just as Lenin did.

CSO: 4004/23

SOVIET EXPANSION IN SOUTHEAST ASIA

Beijing RED FLAG in Chinese No 3, 1 Feb 82 pp 46-48

[Article by Sun Fusheng [1327 4395 3932]]

[Text] Southeast Asia is an important area in the global strategy of the Soviet hegemonists.

This is, first of all, determined by the strategic importance of the geographic situation of this area. The Southeast Asia area consists of two major parts: the Indochinese Peninsula and the Malay Archipelago. It covers a vast stretch of the sea spanning both the Pacific and the Indian Oceans, encompassing more than 12,000 islands, big and small. China lies to its north, and India to its west, and Japan, Australia and the U.S. bases in the Pacific stretch across the seas. Its situation in the oceans makes it imperative for the Soviet hegemonists to establish for themselves a "bow-shaped navigation line" in the east that links the Mediterranean, the Red Sea, the Indian Ocean, the southwest Pacific, the Sea of Japan and the three continents of Europe, Asia and Africa, if the Soviet navy wants to enter the Indian Ocean and the Mediterranean to scramble for supremacy with the United States. The establishment and control of this navigation line will not only link their Black Sea Fleet with their Pacific Fleet and enable them to support one another, but will also enable the Soviet hegemonists to close up the channel through which the U.S. Pacific Fleet enters the Indian Ocean, reduce the strength of the United States in the Far East and threaten China from the seas. Moreover, the establishment and control of this navigation line will enable them to cut off the transportation line between the Far East and Australia and between the Far East and Europe, and thus seriously threaten the United States and Japan and economically stifle Japan, which relies on foreign trade for its survival. The situation of mainland Southeast Asia will enable the Soviet Union to coordinate activities in this area with its expansionary activities in northeast Asia, central Asia and the subcontinent of India and to set up anti-China bases in the areas to the south and southwest of China, if the Soviet Union controls the Indochinese Peninsula.

Second, there are abundant natural resources in Southeast Asia. For example, more than half of the tin reserves in the world are located there, and about 85 percent of the natural rubber in the world is produced there. In the land and sea areas of Southeast Asia there are also rich sources of important strategic materials such as oil and natural gas. For the Soviet Union, the Southeast Asia area is not only a important source from which it grabs strategic materials, but also an important latent market.

Third, most of the Southeast Asian countries did not achieve their independence until after World War II. They are economically poor and backward and they urgently want to develop their national economies. Politically, because of the protracted colonial rule and oppression, there is a relatively strong nationalist feeling in most of them. Besides, they are all faced with problems of varying degrees of complexity relating to nationalities, religions and borders, and that originate from their history. For Soviet hegemonists who are carrying out expansionary activities in the guise of "anticolonialism" and "socialism," these problems are something they can take advantage of.

From the mid-1950's to the late 1960's, the Soviet policies in Southeast Asia were aimed at establishing a foothold there. For this, it tried every trick to stretch its antenna into this traditional sphere of the Western colonialists' influence by exploiting the conflicts between the new and old colonialists and the Southeast Asian countries and people and by focusing its penetration activities on a few selected districts under the banner of "supporting the national liberation movement" and "opposing imperialism and colonialism."

From the late 1960's to the mid-1970's, the Soviet Union took the opportunity of the U.S. predicament in the Indochina war and hastened to increase its strength. Along with the growth of its military and economic strength, the Soviet Union fiercely scrambled with the United States throughout the world and thus started its all-round expansion in Southeast Asia.

Politically, the Soviet Union put forth the proposal for establishing the so-called "collective security system in Asia." It vainly hopes to incorporate not only Southeast Asia but the whole of Asia into its sphere of influence. But the Southeast Asian countries have given a cold response. The five ASEAN countries, furthermore, proposed to set up a peaceful, free and neutral Southeast Asia area that would be free from external intervention in order to counter the Soviet proposal. At the same time, the Soviet Union has been vigorously intensifying its penetration in Vietnam. During the Krushchev period, the Soviet Union adopted a "noninterference" policy toward Vietnam's national salvation war of resistance against the United States, and refused to give any support. On the contrary, it continuously put pressure on Vietnam, for fear that the aggravation of the war in Vietnam would lead to direct conflicts between the Soviet Union and the United States and make it impossible for Khrushchev to carry out the policies he was craving at that time of "Soviet-U.S. cooperation" in ruling over the world. When Brezhnev came to power, he saw the advantage in interfering in Vietnam. He changed Khrushchev's policy and gave "aid" to Vietnam in order to exert a greater influence in Vietnam, foster the pro-Soviet clique and use the Vietnam problem as something to barter in its contention for hegemony with the United States. According to statistics, by the end of 1975, the Soviet Union had staked more than $5 billion in Vietnam.

Militarily, despite the "awesome" strength of the Soviet Pacific Fleet in the eyes of American Navy specialists, this fleet can only perch in two easily vulnerable bases (Vladivostok and Petropavlovsk). Therefore, the Soviet Union urgently wants to find bases in the Southeast Asian sea area. Its activities are focused on "internationalizing" the Strait of Malacca and on seeking to establish navy bases in Southeast Asia to berth its warships and to install equipment for supplying and repairing its warships.

Economically, besides intensifying its trade activities, the Soviet Union was characterized, in this period, by attempts to make more use of the form of setting up joint venture enterprises and transnational companies. Taking the opportunity of the situation whereby the Southeast Asian countries suffered from the monopoly over maritime trade by European and American shipping companies because of their lack of shipping enterprises of their own, the Soviet Union made a breakthrough in the shipping business and set up a "Singapore-Soviet shipping company," "Philippine-Soviet joint shipping company" and the "Thai-Singapore-Soviet shipping company." It was not a casual occurrence that the Soviet Union worked hard to seize a part of the shipping business in Southeast Asian countries. On the contrary, this was closely related with the maritime expansion of the Soviet Union. The Singapore branch of the Moscow People's Bank, the most important Soviet transnational company in Southeast Asia, tried every means to conduct economic penetration in Southeast Asian countries. It gave loans to some enterprises there and then put them under its control by compelling them to repay the loans. It also supplied loans to speculators there and helped them create confusion in the market there.

The Soviet Union has sent a large number of spies in the guise of diplomats, reporters and sailors to steal information, foster pro-Soviet elements and carry out other illegal activities. According to the information disclosed by the relevant departments in Thailand, more than half of the 80-plus Soviet officials who work in the Soviet Embassy in Bangkok and in the Economic and Social Commission for Asia and the Pacific of the United Nations are spies of the KGB and the military intelligence agency.

Since the end of the war in Indochina in 1975, Soviet expansion in Southeast Asia has entered a new stage. Under the new situation, the Soviet Union's policies in Southeast Asia have been aimed primarily at taking advantage of the readjustment and further reduction of the strength of the United States in Southeast Asia and by a single stroke filling the "vacuum" and supplanting the United States. Its strategy has been to use Vietnam as its Cuba in Asia. It exploits the regional hegemonist ambition of the Vietnamese authorities, supports Vietnam to piece together the so-called "federation of Indochina" and regards this measure as an important step in its expansion throughout Southeast Asia.

First, the Soviet Union continues to increase its economic investment there. It has given a huge amount of "aid" totaling 2.5 billion rubles for Vietnam's 1976-1980 economic development plan. In 1975 and 1976 the two sides signed trade payment and technical assistance agreements in which the Soviet Union planned to "help Vietnam in the construction" of 40 new projects and increase the total value of trade by 50 percent. According to statistics, the total trade between the Soviet Union and Vietnam amounted to 200 million rubles in 1975, but it increased by leaps and bounds later and jumped to more than 610 million rubles in 1980. In July 1981 the two sides signed the economic and technical agreement for the period 1981-1985 which stipulates that the Soviet Union should provide "aid" for Vietnam's more than 100 industrial projects. Thus, the Soviet Union has made Vietnam economically dependent on it to a serious extent.

Second, the Soviet Union has been making great efforts to rein in, control and use the Le Duan Vietnamese clique as its "firm outpost in Southeast Asia." It has unconditionally supported Vietnam in raising unreasonable territorial claims to China's Xisha and Nansha Islands, cruelly persecuting and expelling the Overseas Chinese in Vietnam and conducting various regional hegemonist activities in Indochina. In June 1978 the Soviet Union took Vietnam into the COMECON, and in November the two sides signed a "treaty of friendship and cooperation" that was, in essence, a treaty of military alliance. Thus it has tightly bound Vietnam to the chariot of the Soviet hegemonists' expansion. At the instigation and with the support of the Soviet Union, Vietnam compelled Laos to sign the "Vietnam-Laos treaty of friendship and cooperation" and the "border treaty" in 1977, thus establishing the so-called "special relations" between the two countries, and it launched large-scale military aggression against Kampuchea in 1978, occupied Phnom Penh in 1979 and set up a puppet regime there.

Third, through Vietnam, the Soviet Union has demonstrated its military strength in the Indochinese area on a large scale. Since 1980, the Soviet Union, under the pretext of "aid," has continuously sent arms and military equipment, the average daily value of which has amounted to more than $3 million, into Vietnam. It has equipped the Vietnamese Army and Navy with Soviet-made bombers, fighter planes, "Petya" class escort vessels and other warships. At the same time, a large number of Soviet military advisers and specialists have poured into Vietnam. Their number now totals more than 10,000, and they control the Vietnamese Army, Navy and Air Force. The Soviet Union is speeding up its establishment of military bases in Indochina. As was reported, the former American large-scale, modern military bases in Vietnam, such as Cam Ranh Bay and Danang, have now become Soviet naval bases. Moreover, the Soviet Union has built a navy base in Kompong Som, Kampuchea and a series of radar stations, electronic reconnaissance installations and ground-to-air missile bases along the coastal areas and the Sino-Vietnamese border areas in Vietnam and in many places in Laos and Kampuchea. Because it has obtained military bases in the three Indochinese countries, the Soviet Union has greatly increased its military strength in the Pacific and Indian Oceans. This has made it possible to push its Pacific Fleet 2,000 nautical miles further south and expand the area of its activities to the Gulf of Thailand. Soviet long-range reconnaissance planes and intelligence ships of various types have been collecting information on a large scale in the Southeast Asian sea area, using Vietnam as their base.

The fact that a Soviet military force has entered Southeast Asia on a large scale has greatly worried the countries there as well as intensified its threat to the United States, Japan and other countries. If the Soviet Union launches an attack from its bases in Vietnam, it can immediately cut off the vital channel that connects the two oceans and is vital to the United States and Japan. Thus, it can establish strategic supremacy over the United States in the entire "dumbbell-shaped area" from the Persian Gulf in the Indian Ocean to the Pacific Ocean.

Fourth, the Soviet Union continues to collude with Vietnam in its international activities. They are striving to legalize their aggression against Kampuchea and are trying every political and diplomatic means to give a legitimate appearance to the puppet regime in Kampuchea. For example, at the United Nations General Assembly sessions, the Soviet representative has time and again tried to deprive Democratic Kampuchea of its legitimate seat in the United Nations and attempted in vain to force the seating of the representative of the Kampuchean puppet regime in the United Nations. Brezhnev even personally "invited" the head of the Kampuchean puppet regime to visit Moscow in order to raise the regime's prestige in the world and to give it a legitimate appearance. However, because of the opposition of the countries in the world that uphold justice, and especially of the ASEAN countries, the United Nations has not only consented to Democratic Kampuchea's retention of its legitimate seat, but has also passed one resolution after another demanding the withdrawal of the Vietnamese Army from Kampuchea.

The Soviet Union, seeing that the attitude of the ASEAN countries is of key importance if the Soviet Union and Vietnam are to change their isolated position in the world caused by the Kampuchean problem, has tried hard to persuade the ASEAN countries to get over the "misunderstanding caused by the Kampuchean clash." It has asked the ASEAN countries to hold talks with Vietnam and promises that if only ASEAN recognizes the Kampuchean puppet regime, all the problems troubling the ASEAN countries, such as those related to the Vietnamese refugees and the "security" in Southeast Asia, will be "readily solved." This hypocritical attitude of the Soviet Union has been exposed and denounced by the ASEAN countries.

The expansion in Southeast Asia of the Soviet Union and Vietnam in collusion has further revealed the hegemonist nature of the Soviet Union to the world's people and made the Soviet Union even more isolated in the world. The heroic Kampuchean people have persisted in their patriotic armed struggle and have placed the Soviet and Vietnamese hegemonists in a more and more difficult predicament and in a more and more passive political position. At the initiation of the active efforts of the ASEAN countries, the United Nations passed a resolution to hold an international meeting on the Kampuchean problem in the summer of 1981, which was to be attended by dozens of countries. During the meeting the correct demand for the withdrawal of the Vietnamese Army was again passed. In October 1981, the UN General Assembly approved the report by the international meeting on the Kampuchean problem with an overwhelming majority and reiterated its resolution, demanding the complete withdrawal of Vietnamese troops from Kampuchea.

The development of the situation in Southeast Asia at present is very unfavorable for both the Soviet and the Vietnamese hegemonists. But we should not fail to see clearly that the Soviet Union will never be easily compelled to change its expansionary policies in Southeast Asia. In September 1981 Brezhnev held secret talks with the so-called heads of the three Indochinese countries in the Crimea and drew up the new strategy of continuously holding "dialogues" with ASEAN, "softening the attitude" of the ASEAN countries, demoralizing and dividing them. The people of the Southeast Asian countries and people throughout the world have to persistently carry on a blow-for-blow struggle to stop the Soviet hegemonists' expansion in Southeast Asia and throughout the world so as to safeguard peace in Southeast Asia and in the entire world.

IT IS NECESSARY TO CONSTANTLY AND CONSCIOUSLY STUDY COMRADE MAO ZEDONG'S SCIENTIFIC WRITINGS

Beijing RED FLAG in Chinese No 3, 1 Feb 82 inside back cover

[Article by Chen Zhongbang [7115 0022 6721] of PLA Unit 35201]

[Text] The "resolution" passed by the 6th Plenary Session of the 11th CCP Central Committee points out: "Mao Zedong Thought is the invaluable spiritual wealth of our party, and it will guide our action for a long time to come." Therefore, it is very important to constantly and consciously study Comrade Mao Zedong's scientific writings. But in the recent past a number of places and units did not pay attention to the study of political theory; in particular, there has been the tendency of paying no attention to the study of Comrade Mao Zedong's works. Not long ago, our unit carried out investigations on studying in the army and the results were that most units and individuals basically have not studied Comrade Mao Zedong's works in the past few years. As a consequence, we feel this is a weak link in political theory education, that is, not to actively encourage the study of Comrade Mao Zedong's scientific works.

We found from our investigations that there are several reasons for this situation. First, our young cadres at various levels and most fighters do not really understand the great contributions and achievements of Comrade Mao Zedong and the scientific system of Mao Zedong Thought, nor do they really understand the importance and necessity of studying Comrade Mao Zedong's scientific works. Second, some comrades cannot differentiate between Mao Zedong Thought and the mistakes made by Comrade Mao Zedong in his later years; they do not know what they should be studying. This occurrence has been one of the main reasons for there being an unwillingness or fear to study. Third, some units and individuals have mixed up the good atmosphere and the good method in the mass study of Comrade Mao Zedong's works with the absurd theory, formalism and pragmatism that were peddled by Lin Biao and the "gang of four" and consequently, they have completely denied the initiative of the masses. Fourth, the leadership of some units and political organizations are worried and doubtful and they have taken a wait-and-see attitude. Therefore, they have neither taken the lead in study nor conscientiously analyzed and solved various misunderstandings among the masses by organizing study sessions.

In order to change this situation and restore the good atmosphere in the study of Comrade Mao Zedong's works, we suggest that it is necessary first of all to study the "resolution," fully understand the historical contributions and achievements made by Comrade Mao Zedong and the scientific value of Mao Zedong Thought and understand that Comrade Mao Zedong's scientific writings were, are and will continue to become invaluable spiritual wealth in our study and inheritance, so as to unify our thinking on the basis of the conclusion of the "resolution." This is the basic premise and ideological foundation for studying well Comrade Mao Zedong's scientific writings. In addition, it is necessary to continue to eradicate the influences of the "left" and other wrong ideas in our study and practice, further restore order theoretically and draw a distinction between Mao Zedong Thought and the mistakes he made in his later years. We must overcome the trend of unwillingness to study Comrade Mao Zedong's scientific writings because he made mistakes in his later years; we must also overcome the tendency of adopting his wrong views and denying that his views in his later years were wrong and subsequently continuing to hold such views. That is to say, we must study correctly. The leadership and political organizations at various levels must correctly understand and analyze the study situations in their respective units. They must understand that some comrades are disgusted with study and are passive because of the influence of wrong ideas; but at the same time they must also understand that many comrades respect Comrade Mao Zedong and are aware of the great role of Mao Zedong Thought and consequently, they have a desire to study. With such an understanding, the various leadership and political organizations will have the courage to advocate study and organize various army units to study well. We must correctly sum up experiences and draw lessons from our study in the past, persist in the principle of giving guidance so as to basically improve the consciousness of the masses in their study. It is necessary to work out practical planning, take concrete and effective measures, sum up experiences in time, constantly improve the method of study and raise the study level. A key question for consciously carrying out this study to attain certain achievements is that the leadership at various levels must take the lead in the study. Therefore, the leadership at various levels must strive so that they will become pace setters in the study and use of the stand, viewpoint and method of Mao Zedong Thought in guiding all of their work.

We believe that so long as we are able to consciously study well the "resolution" and actively lead and organize well the study of Comrade Mao Zedong's scientific writings, we will be able to build a good study atmosphere and Mao Zedong Thought will be handed down generation to generation to steadily guide our cause on the correct road.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

PULL OURSELVES TOGETHER IN ESTABLISHING A GOOD PARTY WORK STYLE

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 2-5

[Article by Editorial Department]

[Text] Over 5 years have passed since the smashing of the "gang of four." The history of over 5 years can be subdivided into three stages. The first stage was from the smashing of the "gang of four" to the 3d Plenary Session of the 11th CCP Central Committee. In these 2 years, we did a lot of work but there were also some shortcomings in our work. Comrade Deng Xiaoping referred to this as advancing amid hesitation. The second stage was from the third plenary session to the sixth plenary session in which we brought order out of chaos in an all-round way and began to shift the focal point of the party's work to economic construction. The third stage was from the sixth plenary session, that is, from July 1981 to the present. The communique of the sixth plenary session states: "This session will go down in history for fulfilling the historic mission of setting to rights things which had been thrown into disorder in the guiding ideology of the party." That is to say, in the guiding ideology of the party, the historic mission of setting to rights things which had been thrown into disorder has been fulfilled. Naturally this does not mean that in practical work all the tasks of bringing order out of chaos have been fulfilled. For example, in implementing the policies a lot of work is yet to be accomplished and there are also similar cases in other aspects. What should we do then in the days to come? What is the focal point of the work of the whole party? The resolution of the sixth plenary session states: "This session calls upon the whole party, the whole army and the people of all nationalities to act under the great banner of Marxism-Leninism and Mao Zedong Thought, closely rally around the CCP Central Committee, preserve the spirit of the legendary foolish old man who removed mountains and work together as one in the defiance of all difficulties so as to turn China step by step into a powerful modern socialist country which is highly democratic and highly cultured." The most important part of this paragraph is the spirit of the legendary foolish old man, of working together as one, defying all difficulties and building a powerful modern socialist country which is highly democratic and highly cultured. The task has been presented very explicitly. According to this guideline, in reviewing the historical process of the past 5 years and more, we can summarize it into the following points: First, putting an end to the confusing state of affairs; second, setting to right the reversal of right and wrong; third, developing the national economy; and fourth, building socialist spiritual civilization. It will take several decades of arduous struggle to gradually build our country into a modern socialist country which is highly democratic and highly cultured. As stated by the sixth plenary session, it is all the more necessary for us to concentrate our efforts on the socialist modernization drive and build socialist material and spiritual civilization in an all-round way. Efforts should be made to achieve greater progress year after year in the economic, political, cultural and social development of our country.

To promote our cause year after year, the crucial issue is that of the party, that is, to build our party well. Building our party well depends on, first, whether the party's line, principles and policies are correct and second, whether the party's ranks have firm combat strength. It is necessary for all the comrades in the party to constantly pay close attention to the two questions. On the question of line, principles and policies, Comrade Mao Zedong was quoted as saying that line decides everything, which means that the correctness or incorrectness of the line, principles and policies and their conformity or lack of conformity with reality decide the success or failure of the entire cause of our party. Over the past 3 years, that is, since the third plenary session, China's internal situation has improved immensely under the guidance of the whole series of correct line, principles and policies of the CCP Central Committee. Naturally, with the constant development of history, new situations and new problems have constantly emerged, and the party's line, principles and policies should also be constantly enriched, developed and perfected. Therefore, all comrades in our party should unswervingly and unhesitatingly support the present line, principles and policies of the CCP Central Committee. At the same time, we should also open up new prospects by constantly studying new situations, finding new methods and solving new problems. All comrades in our party should pull themselves together and be prudent in order to remain sober-minded and correct in the line, principles and policies and avoid making great mistakes.

Now the major problem confronting us is that of the second aspect, that is, the lack of combat strength in the ranks of our party. This is a widespread problem and a very grave one at that. On many occasions during the Yanan period, Comrade Mao Zedong pointed out that the lack of combat strength in some of our party organizations was due to three factors, that is, ideological and organizational impurity and inappropriate work style. His analysis is still of great guiding importance today. This makes it necessary for us to pay constant attention to the ideological and organizational impurity and inappropriate work style in the party organizations. This is a fundamental question in striving for a decisive improvement in party work style.

Ideological impurity may have different manifestations in different historical periods. Before the Yanan period, ideological impurity manifested itself mainly as subjectivism, namely, dogmatic subjectivism. Today, ideological impurity manifests itself mainly as bourgeois liberalism and ultra-individualism that has contaminated the minds of some party members. They do not have confidence in the proletariat, in socialism or in the party. Instead, they have faith in the bourgeoisie and capitalist countries and practice ultra-individualism. At the same time, some people still have remnant feudal ideas or have not eliminated the "leftist" ideas in their minds.

An inappropriate work style means bureaucracy and the serious tendency to be alienated from the masses. Comrade Deng Xiaoping in his criticism stressed bureaucracy and the tendency to be alienated from the masses. Overlapping and overstaffed administration, shifting responsibility onto others and arguing back and forth over small things, doing one's work without investigation and failure to criticize and fight unhealthy tendencies are all manifestations of bureaucracy.

Organizational impurity refers to the fact that there are party members who have totally departed from the party's correct stand and are completely unqualified for party membership. Some of them may be called remnants of the "gang of four" or the gang's cat's paws. They are "party members" who are shameless and who do not have the slightest bit of what it takes to make a Communist Party member. Are there a great number of these people? We must not overestimate their strength, but neither should we underestimate it. We should maintain a high degree of vigilance against it.

The tendency to ignore or even oppose the party's leadership as well as activities in violation of law and discipline are examples of problems in the party's ideology, work style and organization. Some people oppose the present policies of the CCP Central Committee under various banners. For example, they flaunt the banner of representing the interests of the party and the people or defending certain interests or even flaunt the banner of upholding the dictatorship of the proletariat, which in fact they oppose, the party's line, principles and policies, oppose socialism and oppose the party's guiding ideology--Marxism-Leninism-Mao Zedong Thought. Some other people wantonly engage in activities in violation of law and discipline, such as practicing graft, giving and accepting bribes and engaging in smuggling and selling of smuggled goods in a big way. In some localities, they have cheated the state of its property and caused several millions of yuan or tens of millions of yuan in property losses to the state. There are also some people holding leading posts who have been irresponsible in their work for a long time with the result that the work and the cause suffer and both the state and the people suffer losses. Furthermore, cadres at the county and commune levels in some localities refuse to go to work in order to do farm work at home all the year round. They receive wages from the state as usual while deriving income from farming. Can this state of affairs be allowed to exist?

At present, what merits our particular attention is that some cadres who are party members, and even some cadres holding leading posts, have also committed serious illegal and criminal acts, such as smuggling and selling smuggled goods, embezzling or taking bribes and grabbing large quantities of state property. These illegal and criminal activities in the economic field have damaged the party's prestige and aroused the indignation of party members and the masses of people. This is a life-and-death question for the party. The whole party must pay close attention to it and deal with it resolutely, seriously and conscientiously. Severe punishment must be meted out to those criminals proven to have committed serious crimes, especially those who occupy leading posts. We should not be irresolute and hesitant, for to tolerate evil is to abet it.

Over the past few years we have talked about the question of party work style in our press almost every day. Comrade Chen Yun's words that "the question of work style of a party in power is one that has a strong bearing on the life and death of the party" in particular have been relayed to all people, high and low. There are quite a few people, however, who, when criticized, will say that it refers to others and that they are an exception. The words and deeds of these people who pose as exceptional party members and who disregard law and discipline have reached an intolerable degree of seriousness.

Over 5 years have passed since the smashing of the "gang of four" and over 3 years have passed since the convocation of the 3d Plenary Session of the 11th CCP Central Committee, but the party work style has not fundamentally improved. Why? There may be various reasons but, generally speaking, there are roughly four points:

First, there is a lack of good understanding of the situation. Quite a few CCP committees do not have a good understanding of the situation. What problems do you have in your units? Have you discovered them? Have you investigated them? They have no idea about them. A few CCP committees fail to investigate the problems when they discover them, but they always put in a good word for the cadres at the lower levels. They turn big problems into small problems and small problems into no problems at all by saying that the work in their unit is really a hard nut to crack and that there are a lot of practical difficulties and so on. Without understanding the situation, it would be impossible to make a correct strategic decision or a correct determination. Comrade Mao Zedong said while he was in Yanan that some people are completely in the dark about the situation and try to catch sparrows by closing their eyes. Sparrows can fly. How is it possible to catch them by closing one's eyes?

Second, some comrades do not keep a clear head or a clear orientation. For a time, improving party work style has been exclusively a question of eliminating special privileges, which is inappropriate. We do not mean that special privileges should not be opposed, but if we reduce the question of party work style, which has a bearing on the whole party and on various aspects, into one of special privileges, we will certainly come to grief. They are two basically different things. In improving party work style, it is first of all necessary to pay attention to the question of political line, to the question of ideological and organizational impurity and inappropriate work style and to their concentrated manifestations at present.

Third, some comrades have incorrect methods of work. That is to say, they do not bring into play the positive factors of the whole party and do not mobilize the masses. Good comrades account for the great majority in our party and it is necessary to ask them to air their views. It will not do to rely on just a small number of people. We should rely on the numerous good cadres and the activists among the broad masses to overcome the unhealthy tendencies, to wage struggles against activities in violation of law and discipline and to punish the extremely small number of people who have seriously violated law and discipline, particularly those active criminals.

Fourth, some comrades in our leading organs, particularly the various departments and commissions of the CCP Central Committee and the leading organs at the provincial and municipal levels, do not have sufficiently strong determination. They always say that this matter involves numerous difficulties and it is impossible to solve it. First they say, "let us leave it at that" then, "let us go about it slowly." They say that lice will not bite when there are too many of them. How can that be? Since there are so many lice, it is necessary to catch them one by one. Naturally we should go about things steadily and reliably but we should have strong determination. Without determination, bringing order out of chaos is out of the question. Let us consider the following matters. Over the past few years we have brought order out of chaos on a few major problems. Can we achieve this without determination? The sixth plenary session has solved two major problems: one is the resolution on certain questions in the history of our party and the other is the leading body. Can we achieve this without determination? In dealing with some matters, we should be vigorous and resolute regardless of the difficulties and strictly enforce orders and prohibitions. Many of our good comrades have over the past few years acquired the bad habit of trying not to offend anybody. They do not dare to offend others and carry out criticism and self-criticism, preferring to "plant more flowers but fewer brambles." It will be impossible to improve party work style if the situation goes on like this. The CCP committees and discipline inspection commissions at various levels should unite closely around the CCP Central Committee, and an important sign of this close unity is to pull ourselves together in establishing a good party work style. How can we unite closely around the CCP Central Committee in the absence of this point? In brief, without having a firm grasp of party work style, we cannot begin to talk about uniting closely around the CCP Central Committee. If we succeed in establishing a good party work style and party discipline, all other problems can be easily solved.

In order to fundamentally improve party work style, all party members and party cadres, especially leading cadres at various levels, must strictly uphold the principles guiding the political life of the party and carry out criticism and self-criticism conscientiously instead of perfunctorily and superficially. Every Communist Party member should conscientiously examine his words and deeds, especially his behavior since the 3d Plenary Session of the 11th CCP Central Committee in order to determine whether he meets the criteria of a party member and whether he has fulfilled his duty as a party member. For example, we should ask ourselves: first, whether we have resolutely implemented the party's line, principles and policies; second, whether we are conscientious in the tasks entrusted to us by the party and in our jobs; third, whether we have exemplarily abided by and have not violated the principles guiding the political life of the party and the laws and decrees of the state; fourth, whether we have upheld the party principles and dared to resist and wage struggles against bourgeois liberalism, ultra-individualism, anarchism, bureaucracy in the party as well as the erroneous words and deeds of forming factions and engaging in factional activities; and fifth, whether we have been concerned with the masses, have linked closely with the masses and shared the comforts and hardships of the masses. These are the major signs that determine whether a party member has a good party character, work style and discipline. We believe that so long as each of our party members sets strict demands on himself according to the criteria of party character, work style and discipline and is ready to correct his mistakes, there will certainly be a marked improvement in the work style of our party.

All party members must remember that our party's sole purpose is to serve the people. Over the past several decades, our party has made indelible contributions to the national liberation and the victory of the socialist cause and enjoyed the respect and confidence of the people of all nationalities throughout the country by fighting valiantly and advancing wave upon wave. Now we are shouldering the heavy historical responsibility of leading the people of the whole country in building a powerful modern socialist country. The 1 billion people are placing high hopes on us and the examples of innumerable revolutionary martyrs are encouraging us. Can we not continue to give play to our exemplary vanguard role and further raise the party's combat effectiveness? How can we tolerate the continued contamination of our party by various filthy elements? The noble character of our fighters lies in getting rid of the old to make way for the new. In the new struggles, the whole party should strive for new victories by promoting our militant spirit and uniting the people of the whole country!

CSO: 4004/25

SEVERE PUNISHMENT SHOULD BE GIVEN TO LEADING CADRES WHO VIOLATE LAWS AND COMMIT CRIMES

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 6-8, 38

[Article by Commentator]

[Text] Since the beginning of the new year, the party committees at all levels and their discipline inspection commissions and the judicial departments of the governments at all levels have been paying close attention to investigating and handling major criminal cases, especially those involving leading cadres, involving smuggling, trafficking in smuggled goods, speculation, embezzling, taking bribes and appropriating large amounts of state property. They have been resolutely looking into these cases and thoroughly investigating them, and have punished the offenders in accordance with the law. This is something that has won the most vigorous support of the people and something that has immensely satisfied the people. Undoubtedly, this will vigorously promote the rectification of party work style and improve the general mood of society.

During the past few years, along with the development of the work of bringing order out of chaos, the CCP Central Committee has constantly exhorted the whole party membership and especially the leading cadres at all levels and told them that first, they should not take part in unhealthy practices, and second, they should combat all kinds of unhealthy practices. We must say that most of the leading cadres have lived up to the instructions of the party and the expectations of the people. They have not only maintained their integrity and persisted in always working in the interest of the public, but have also been able to conscientiously pay attention to the work of correcting the unhealthy trends and have striven to improve party work style. In the eyes of the people, what they have done is satisfactory. Nevertheless, we should not fail to see that there is still a small number of leading cadres who are not acting in this manner. Some of them turn a blind eye to the economic criminal activities that have been occurring right under their noses and allow these activities to go on unchecked. This shows how lax and weak they are. Others have adopted an indulgent attitude toward these activities, and thus they, in fact, have supported and shielded the offenders. Still others have even colluded with the offenders and directly or indirectly taken part in, or plotted behind the scenes, economic criminal activities. This is one of the major reasons why there still fails to be a basic change in party work style as well as one of the major reasons why criminal activities in the economic field have remained unchecked.

How could economic criminal activities have run rampant, if, despite laxity and weakness, a few leading cadres in our party and government organizations and enterprises had not indulged, supported, shielded or even directly taken part in these criminal activities? Judging from various areas' major economic criminal cases which have either been investigated and handled or are currently being investigated and handled, we can see that these cases have the following points in common: establishing ties with both the higher and lower levels; domestic and foreign collusion; many cliquish activities; huge monetary sums; crafty operational methods; and generally speaking, cadres' involvement in these activities. In particular, some cadres holding leading posts not only give the green light to all types of criminals and act as such criminals' "protective umbrella" but also participate in smuggling activities, buy and sell smuggled goods, are corrupt, accept bribes and steal large amounts of state property. In fact, they themselves are criminals. The former CCP secretary and director of the Guangzhou Municipal Telecommunications Bureau, Wang Weijing, is just one such example. The number of such people is small, but their evil impact is very great and serious. This is because these people have power in their hands and their criminal activities are thus facilitated. They often conduct evil activities under the excuse of serving the interests of the "public" and try to make illegal activities appear "legal." They have not only caused especially serious economic losses but have also destroyed the prestige of our party and corrupted the work style of our party and the general mood of our society. This is an inestimable political loss. If we want to bring about a decisive change for the better in party work style this year, we should adopt resolute and powerful measures, including the important measure of handling gravely the problems of the illegal and criminal offenses of leading cadres. Failure to solve this problem will make it impossible to rectify party work style and to improve the general mood of society or to stabilize public security. We should never treat this problem lightly.

Our party is a party in the ruling position and our country is a socialist country under the people's democratic dictatorship. All our leading cadres at any level can only be the servants of the people, no matter how high their ranks are, how long they have been participating in the revolution and how many contributions they have made to the party and the people. They only have the duty to serve the people wholeheartedly, but have no special privileges. The power in their hands is endowed by the party and the people, and must be used to serve the people. Anyone who uses the power endowed to him by the party and the people for private ends is deserting the cause of serving the people. This will result in the masses of people losing confidence in him. Moreover, if he uses his power to engage in smuggling, trafficking in smuggled goods, speculation, bribery or other crimes, he will not be treated leniently under party discipline and under state law. The "guiding principles for inner-party political life" clearly and definitely provides that, "CCP members are never allowed to use their official positions to seek private ends." The following is also clearly and definitely stipulated in the "criminal law" of our country: "State functionaries who exploit their offices to engage in smuggling and speculation must be severely punished." These regulations were not made without good reason. Some young people in society received judicial punishment because they pursued money and material ease and comfort and committed crimes of theft and robbery. We say that they got what they deserve. On the other hand, what should be done if some leading cadres cannot resist the bourgeoisie's attack with sugar-coated bullets, lose the morality and qualifications of a CCP member and pursue money and material ease and comfort by exploiting their official positions to engage in smuggling, trafficking in smuggled goods, speculation, embezzling, bribery and other criminal activities? Why should they not receive the legal punishment they deserve? The current problem is that those cadres who commit crimes have not been strictly dealt with according to law and that quite a few major criminal cases involving leading cadres have not been handled in a timely manner. These things really should not have happened. We must stress that everyone is equal before the law. Our party can never allow the existence of those special party members and cadres who are not bound by party discipline and state law. We must seriously investigate and handle all those major economic criminal cases that involve leading cadres. Proven criminal cases and serious offenses must be strictly handled as quickly as possible according to the law. We should prosecute and punish those people who should be prosecuted and punished and should also strictly handle those cases that should be strictly handled; otherwise, we will not be able to destroy the arrogance of criminals in the economic field. As Comrade Mao Zedong said well, "No matter how many good deeds you did in the past and no matter how high your post, if today you are not doing a good job, not solving problems correctly and thus harming the people's interests, they will not forgive you." ("Selected Works of Mao Zedong," Vol 5, p 422) We should never copy the practice of "senior officials are not liable to judicial punishment" which was prevalent in the old society.

Our party has always opposed the practice of bureaucrats shielding one another. Whoever has done things that harm the interests of the people should be criticized and educated, if his case is not serious, or be punished, if his case is serious. As far back as more than 40 years ago, Huang Kegong, the then leader of the sixth team in the anti-Japanese military and political university, shot and killed a female student in the northern Shaanxi government school, because he failed to coerce her to marry him. He was sentenced to death by the supreme court of the Shaanxi-Gansu-Ningxia border area. Although he joined the Red Army when he was very young and had a glorious record in taking part in the fighting in the Jinggang Mountains and the 25,000-li Long March, he could not be forgiven since he had committed a serious crime. In his letter to Lei Jingtian, presiding judge of the criminal court in the supreme court of the Shaanxi-Gansu-Ningxia border area, Comrade Mao Zedong said, "It is precisely because Huang Kegong differs from common people and it is precisely because he has been a CCP member and a Red Army man for many years that we cannot help but do so." "How can we educate our party members, our Red Army men and our revolutionaries or even our common people, if we pardon him?" It was precisely for the same reason that during the initial period after the founding of the PRC, in the campaign of the "three anti's" and the "five anti's," Liu Qingshan and Zhang Zishan were sentenced to death for embezzling huge sums of money. We did not pardon them on the grounds that they had been CCP members and leading cadres for many years. We must apply the most severe legal sanctions against cadres who commit serious crimes and particularly against criminal cadres holding leading posts. This will demonstrate our party's qualities of being open, aboveboard and impartial. By so doing, the vast numbers of party members and cadres can be educated by and learn a lesson from such sanctions. The more important thing is that the broad masses of the people see that our party does not practice favoritism and thus can develop greater confidence in our party. At present, we are seriously investigating and handling major economic criminal cases and are publicly dealing with those leading cadres who have violated the law and committed crimes. The broad masses of the people are not dejected by such scum in our party and within the cadre ranks. On the contrary, they are inspired by our current actions and now have greater faith in the prospects of our party and our country. This is a matter of course.

We all know clearly that we can never completely avoid the occurrence of a few people in the ranks of our party and our cadres violating law and discipline, doing evil things or even committing crimes. In the prolonged course of revolution, it is inevitable that a small number of evildoers have wormed their way into our ranks, and it is also inevitable that some weak-willed people in our ranks degenerate. This is especially true now after the decade of turmoil. Under the present specific historical conditions, there are, in our cadre ranks, remnants of the Lin Biao and Jiang Qing counterrevolutionary cliques, people who have been deeply influenced by the two counterrevolutionary cliques' reactionary idea of "power means everything," scum of the old society who have sneaked into our cadre ranks during the decade of turmoil and the degenerate elements who have not been able to resist the corrosion of bourgeois ideology since we began to carry out an open-door external policy. These people have nothing in common with a communist or a revolutionary, and it is impossible for them to observe law and discipline. The key lies in what attitude we adopt toward them. "Fostering wild grass will harm crops and leniency to criminals will harm the people." We should constantly purify our ranks and should never allow these people to commit evil deeds, damage the party's prestige and harm the interests of the people. If we do not sternly deal with the leading cadres who have violated the law and committed crimes but indulge them, then unhealthy practices and trends will develop unchecked and the ranks of our party and cadres will be corrupted and we will be seriously divorced from the masses. The result will be unimaginably evil.

At present, concerning the handling of the criminal cases in the economic field, some people are advocating the idea that "we should be lenient this time and for just one time." In fact, by "being lenient for just one time" they mean, to make it very clear, shielding criminals. This will create the precedence of shielding offenders and criminals in the future. By so doing, on the surface, we would seem to have investigated and handled the cases of smuggling, trafficking in smuggled goods, speculation, embezzling, bribery and other offenses, but in reality, we would not have solved any problem. By so doing, we will neither mete our proper punishment to the criminals, nor facilitate the rectification of party work style and improve the general mood of society. What is even more serious, by so doing, we will inevitably be divorced from the masses. People may say that we are still conducting the practice of "bureaucrats shielding one another," and, therefore, lose confidence in our ability to rectify party work style and improve the general mood of society. That is why we must sternly handle the illegal and criminal cases of smuggling, trafficking in smuggled goods, speculation, embezzling, bribery and other offenses that have been committed by leading cadres. That is why we must never indulge these leading cadres under the excuse of "being lenient for just one time."

Obstructions will be encountered in strictly handling according to law those leading cadres who have violated the law and committed crimes. Where do these obstructions come from? Such obstructions primarily come from the higher level. Of course, they also come from the lower levels. When a leading cadre violates the law or commits crimes, he often colludes with people at lower levels, some of whom help him and some of whom follow him. Moreover, there are cases of some leading cadres who have been corrupted by criminals under them and thus they themselves have become involved in offenses and crimes. Those who are involved in the offenses and crimes at the lower levels will inevitably create a variety of obstacles to our investigative work and they may even play the trick of sacrificing insignificant accomplices to protect the ringleaders. Besides, in some areas where factionalism is serious, the leading cadres who have violated law and committed crimes are often the leaders of certain factions and the members of their factions may try to protect them when they are being investigated. We should take all these factors into fullest account and should not treat the problem as being very simple. Nevertheless, we must also see that the broad masses resolutely and vigorously support us in investigating economic offenses and crimes. The obstructions from the lower levels are only a problem involving a small number of people and are therefore relatively easy to deal with, however serious they may be. What we should pay special attention to at present are the obstructions from the higher level, namely, the problem of whether the major leaders in some leading departments are not resolute and prompt enough. This is a problem of vital importance. As long as the higher levels are resolute and prompt and have adopted strong measures, the obstructions from lower levels can certainly be removed. The major reasons for not handling or for failing to finish some major cases over a long period of time are that such cases involve some leading cadres and that such leading cadres' immediate superiors are irresolute. In this respect, there are also many different causes. Some leaders find it hard to handle the cases sternly because these cases involve their old comrades or old subordinates. Others hesitate in thoroughly investigating the cases because they themselves have committed some mistakes and are apprehensive that a thorough investigation will not only expose the crimes and offenses of others but may also disclose their own mistakes. Still others have been affected by the decadent and philistine "study of relations" and tried to never offend anybody. There are also leaders who treat violations of the law and crimes as ordinary unhealthy practices and are of the opinion that it is difficult to handle these violations and crimes because so many people are involved. All these wrong ideas have directly hindered the investigation of the offenses and crimes involving leading cadres. Therefore, the prerequisite for investigating major criminal cases and seriously handling those leading cadres who have violated the law in a serious way and committed serious crimes is that higher authorities must have great determination. Comrade Li Xiannian clearly pointed out on behalf of the CCP Central Committee that "this is a major issue that concerns the destiny of our party and our state and we must resolutely, vigorously and speedily deal with it and never relax our efforts until we really solve it." In order to strive to bring a decisive change for the better in party work style, we must resolutely deal blows at all serious offenses and crimes including smuggling, trafficking in smuggled goods, speculation, embezzling and bribery. We should make greater efforts to firmly and strictly handle major cases involving big shots in large organs. The leading groups at all levels must firmly maintain the stand of the party, overcome all variety of wrong ideas, give priority to the interests of the party, of the state and of the people, and do their duty in investigating major criminal cases. Otherwise, if they adopt a diametrically different attitude, turn blind eyes and a deaf ear to major criminal cases that are directly under their noses, or make perfunctory investigations and misrepresent major problems as small problems or even plead for mercy for offenders, absolve offenders from guilt and indulge and shield offenders, they will not be treated leniently under party discipline and state law.

Sternly handling major economic criminal cases and resolutely solving the problem of violations of law and committing of crimes by a small number of leading cadres is a major issue that concerns the task of ensuring that socialist material civilization is saved from damage and the task of promoting the daily development of socialist spiritual civilization. This issue has already aroused the close attention and concern of the broad masses of people. Our whole party membership and all work personnel in state organizations and enterprises who are party members should draw lessons from the handling of major criminal cases, especially those involving leading cadres. Thus they will regard pursuing private ends as a most shameful thing and set strict standards for themselves so as to become good examples in observing law and discipline. Every party member and every cadre must conscientiously examine himself and see how he has observed the law and discipline, whether he has followed the guiding principles for inner-party political life and observed the decrees of the state, whether he has done anything in violation of these principles or decrees, whether he has combated those people who have violated the law and discipline, and whether he has combated these people's deeds. If he finds any shortcomings and mistakes in these respects, then he should overcome these shortcomings and correct these mistakes at once. Otherwise these shortcomings and mistakes will develop and will become very dangerous to him. At present, some of our party members lack party spirit, have a poor work style and are lax in observing discipline. These shortcomings have raised objections on the part of the masses of people. We hope that, through the handling of major economic criminal cases, the broad ranks of party members will be educated. As a result, they will raise their political awareness, consciously intensify their training to develop party spirit, strive to make themselves really qualified party members and bring about a decisive change in our party work style and in the general mood of society.

Every one of us should be fully aware that combating criminal activities in the economic field is a long-term task. Even if all the criminals are punished today, new criminals will crop up tomorrow. This is because our new society has originated from a semicolonial and semifeudal society. The corpse of the old society is not like a human being which can be put into a coffin and buried in a grave. It will rot in the new society and spread its old ideology and customs like the stinking smell of a rotten corpse. The decade of turmoil seriously damaged the fine traditions of our party and thus facilitated the spreading of these old ideology and customs. Moreover, the sharp increase in our contacts abroad during the past few years have also more and more greatly aggravated the corrosive influence of rotten bourgeois ideology and lifestyle and made it a prominent problem. As far back as the eve of the achievement of nationwide victory, Comrade Mao Zedong warned the whole party membership to be on their guard against the bourgeoisie's attack with sugar-coated bullets. We are still faced with such a situation now, but the difference is that the attack now is more serious and on a larger scale. All our party members must keep their minds sober and conduct sustained and resolute struggle against rotten bourgeois ideology and lifestyle.

IN PROMOTING AGRICULTURAL PRODUCTION IT IS NECESSARY TO PLACE MAIN EMPHASIS ON PLANNED ECONOMY WHILE GIVING MARKET REGULATION A SUPPLEMENTARY ROLE

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 9-14

[Article by Zhang Jingfu [1728 0513 1133]]

[Text] The line, policies and principles laid down by the party since the 3d Plenary Session of the 11th CCP Central Committee have produced good economic results. In particular, the most obvious and outstanding results have been produced in agriculture. Take, for example, the conditions of agricultural production in the past 4 years in Anhui. Natural disasters occurred in 2 of these years (drought in 1978 and waterlogging in 1980) and bumper harvests were reaped in the other 2 (1979 and 1981). The general situation is getting better and better. In 1981, an unprecedented bumper harvest was reaped and an all-round increase was registered in agricultural production. Grain output increased by a big margin and diversified economy also developed to a great extent. Great successes were achieved in agriculture and relatively big developments registered in forestry, animal husbandry, sideline production and fishery. Compared with the preceding year, grain output increased by more than 20 percent, cotton output by 17 percent, output of oil-bearing crops by more than 95 percent, output of tea leaves by more than 10 percent and output of cured tobacco by 240 percent. Total agricultural output value grew by 24.6 percent and the commune members' average income per capita increased by more than 50 yuan. Agricultural production has begun to enter a benign cycle and hopefully will continue to increase in the future if no extraordinarily serious natural disaster occurs. It will increase spirally and not vertically. This is the outcome of the compatibility of the party's line, policies and principles with objective laws.

On what ground do we say that agricultural production has begun to enter a benign cycle?

The peasants' enthusiasm has been really aroused. A series of measures, such as raising the prices of farm products, instituting various forms of the production responsibility system and holding trade fairs, have played a remarkable role in leading agricultural production into a benign cycle. If all people show concern for production and vigorously carry out production and if the objective conditions remain the same it is possible to alleviate the severity of a natural disaster or to greatly increase production when there is no natural disaster. The situation really is getting better year after year. Especially after the various forms of the production responsibility system were established, production has increased and the commune members have earned increasingly more income and improved their living conditions year after year. Of course, two conditions still require our close attention: first, even in a good year, there are a few localities which suffer from natural disasters and reap poor harvests; second, 5-10 percent of the households still have difficulties and are lagging very far behind the "outstanding" households although their life is much better than before. We must be sober-minded and earnestly help the disaster-stricken areas and needy families to solve the problems they have encountered in production and daily life. However, generally speaking, the countryside has really been permeated with a new and dynamic atmosphere during the past few years.

As a result of eliminating the practice of issuing arbitrary and impractical instructions, which is a practice that runs counter to objective laws, the grassroots units and the peasants are given decisionmaking power. With this essential power, they give full play to their strong points and develop agriculture, forestry, animal husbandry or fishery according to local conditions. For this reason, the internal structure of the agricultural economy and the geographical distribution of productive undertakings have been rationally readjusted, and the old method of exclusively grasping farming or grain production has been changed. By proceeding from the point of scoring better economic results and achieving an ecological balance, farming has been given up in areas unsuitable for crop growing, and forestry, tea planting or fishery have been resumed. Diversified economy has developed with each passing day. In particular, household sideline production has developed very quickly. This has brought about much better economic results in agriculture. In Anhui, although some enterprises run by communes and production brigades are relatively backward, new economic complexes have mushroomed and are flourishing. For example, in Liuan Prefecture, more than 22,400 complexes of various types were set up last year, which comprised more than 136,200 peasant households, raised funds amounting to 8.26 million yuan and earned an annual income of more than 15 million yuan.

Agriculture is the foundation. With agricultural production taking a turn for the better, the supply of industrial materials continues to increase. At the same time, the countryside needs industries to supply it with greater quantities of more useful means of production and livelihood. This gives rise to the gratifying, favorable situation in which agriculture promotes industry, commerce and finance. This situation has begun to take shape and will probably develop very quickly. This is because agriculture is a big undertaking and there are 800 million peasants. If industry can support agriculture better, industry and agriculture will promote each other. This will provide a great impetus to the further development of our country's national economy.

The new situation of agricultural production testifies to the correctness of the party Central Committee's estimates. Our country is going through great changes and development, passing from confusion to order and from poverty to prosperity. Some new problems have emerged under these new conditions in the wake of great changes and development. The grassroots cadres and the masses have rich, creative and practical experiences in dealing with these problems. We should seriously conduct more investigations and go deep into reality to learn from the grassroots cadres and the masses, to help them sum up their new experiences, and to draw up new measures for consolidating the achievements and further developing the current favorable situation. The new problems encountered while implementing the various forms of the production responsibility system should be further summed up so that they can be improved and elevated. Those concerning the relations between the cadres and the masses and between the government and the enterprises and those concerning the development of grassroots organizations should be summed up so that these relations and organizations can be further improved and strengthened. Those concerning the new economic complexes and new skills in scientific farming should be summed up in a better way so as to provide guidance for the new complexes and to popularize the new skills. The relationship between planned economy and market regulation is an outstanding question at present. This question urgently needs to be correctly solved under the new conditions because the commodity rate in agricultural production has increased as the peasants have solved their food problem. For example, in Anhui, the commodity rate of grain has increased from around 22 percent to more than 25 percent, that of rapeseed has exceeded 80 percent, and almost all of other cash crops and subsidiary agricultural products have been sold as commodities. After their prices were raised, the agricultural products are sold at three different prices in the market, that is, the price of products sold to the state according to the state purchase plan or the quota specified by the state, the price of products sold in excess of the state purchase quota, and the price of products to be sold or purchased by negotiation. This gives rise to new contradictions in the relationship between sale and purchase. Reflected in the plan of crop growing, this involves the question of readjusting the economic levers. Should we place main emphasis on the planned growing of crops or let market prices fluctuate? Industry and agriculture provide a market for each other. Hence the question: In supplying the countryside with the means of production and livelihood, should the industrial departments place main emphasis on the planned supply of goods at stable prices while giving market regulation a supplementary role, or supply the goods at the fluctuating market prices? At present, the supply of many kinds of industrial products falls short of demand. If we adopt the latter method, we cannot basically stabilize commodity prices as a whole.

The party Central Committee has clearly specified the way to handle the new problems arising under the new conditions. We must persist in placing main emphasis on planned economy based on public ownership while giving market regulation a supplementary role. Comrade Chen Yun has talked about this question many times. He said during the Spring Festival at the beginning of this year: Our country has adopted the policy of planned economy. In industry, we should place main emphasis on planned economy; with the implementation of the various forms of the responsibility system in agricultural production, we still must place main emphasis on planned economy. We must thoroughly understand the party Central Committee's policy and carry it out in our work. To do so, we must first clarify two one-sided views. One of these views is: Some comrades hold that planning should be abandoned when the various forms of the responsibility system are implemented into agricultural production. They even fear that, as agriculture has just been enlivened, placing emphasis on planning will again lead to the former mistake of adhering too rigidly to unified planning. These comrades obviously do not understand that ours is a socialist state and its socialist economy is a planned economy, that this is the objective economic law based on public ownership, and that the contradiction between socialized production and private ownership of the means of production has been resolved. Only by persisting in planned economy can we give simultaneous consideration to the state, the collective and the individual and to both immediate and long-term interests, make overall plans and push the national economy to develop along the socialist road. Being inexperienced and influenced by the "left," we failed to apply this law very well and learned many lessons. However, this should not be used as an excuse for us to lose confidence in and have doubts about the planned economy. The faults and errors of the former policies which upheld unified planning too rigidly and fettered the peasants' enthusiasm for production have been corrected following the 3d Plenary Session of the 11th CCP Central Committee. The resolution adopted by the 6th Plenary Session of the 11th CCP Central Committee clearly points out the need to place main emphasis on planned economy and give market regulation a supplementary role. One is the "mainstay" and the other is a "supplement." This is the correct conclusion we have derived after summing up historical experiences and learning lessons. Being "flexible" means "flexibility" in choosing a path whereby the main emphasis is placed on planned economy. "Flexibility" deviating from the path of planned economy will lead to unimaginable consequences. The other one-sided view is: Some comrades cannot adapt themselves to the new problems at present. They fear "disorder" and are full of misgivings. They do not understand that these problems have emerged in a favorable situation of great changes and development. If they handle these problems seriously and according to the policy of placing the main emphasis on planned economy while giving market regulation a supplementary role, they can be sure of "orderly and lively activity." They should not backtrack once they encounter a problem. We must take one thing as the "mainstay" and the other as a "supplement" and coordinate the two. In our practical work, there are, of course, many realms of necessity which we do not know. However, if we uphold the ideological line of seeking truth from facts, pay attention to the new conditions emerging in the course of our work and continue to study new problems, sum up new experiences and search for new measures, we will gradually understand the realms of necessity and enter the realms of freedom.

What should we do in order to implement well the policy of placing the main emphasis on planned economy while giving market regulation a supplementary role in agricultural production? I want to discuss the preliminary experience I acquired in the course of working 4 years in Anhui.

1. In the Planning of Crop Growing, the Output of Staple Crops Is an Indirectly Planned Target But the Sown Acreage Should Be Controlled According to Plan

After the 3d Plenary Session of the 11th CCP Central Committee, necessary readjustments were made in the acreage for growing farm crops in Anhui. As a result, the acreage sown to grain crops was reduced and that sown to cash crops expanded. From the macroeconomic point of view, the land and other resources have begun to show their superiority and yield good results, making a great contribution to the country and enabling the peasants to earn more income. These have been reasonable readjustments. However, it is now time to stabilize these readjustments, and no further changes should be made. We decided that the acreage sown to grain crops should remain at the level of 90 million mu and should not be reduced. In the future, we should make strenuous efforts to increase yields per unit area and to boost output steadily. Acreage sown to cotton should remain at the level of 5 million mu, and the geographical distribution of cottonfields should be more rational. Acreage sown to tobacco leaf should remain at the level of 1 million mu, and we should make strenuous efforts to increase yields per unit area and improve the quality of tobacco. In Anhui, the yields of staple crops per unit area falls short of the average level for the country. This shows that there is a great potential to be tapped and there is plenty of room for increasing yields per unit area. Cash crops which do not need to be planted in grain fields should be planted by making full use of barren hillslopes and wasteland. The proportion and size of areas sown to grain, cash crops and other staple crops should be decided according to the rational distribution specified by the state and be controlled according to the state plan, and the task in this respect should be fulfilled down to the county level. In signing contracts with communes and production teams, a county may specify the minimum quantities of crops to be sold to the state according to the state purchase plan or in excess of this plan, or according to the quotas fixed by the state. It may guarantee fulfillment of these contracts by assigning responsibilities to the households. It may fully arouse the enthusiasm of the production teams and the peasants by giving them the essential decisionmaking power, and should not interfere with them when they are fulfilling their tasks. Thus, it will be possible to unify and harmonize the tasks specified in the state purchase plan and the decisionmaking power needed by the production teams and the peasants. Do the peasants welcome planning? Essentially, they do. They like to work according to a plan, provided policies are steady, rational measures are carried out, reasons are explained to them and there are possibilities for increasing production. They will be reassured because a plan is a guarantee for the supply of the means of production and the marketing of farm products. The peasants in Anhui formerly suffered losses resulting from rash planting. For example, some localities planted too much peppermint and herbaceous peony so that it was difficult to sell them. At present, too much hemp has been planted and there is also a difficulty in selling it. It is necessary to make readjustments and to switch to other crops. During my recent visit to the countryside, some grassroots cadres told me that the commune members hoped that they could get timely market forecasts and information about market changes from the radio. This shows that the commune members welcome planning as a guide. Are there commune members who aim at immediate profits and excessively grow crops they can sell at high prices? Yes, there are. Under these circumstances, we should carry out ideological work among them. We should tell the commune members clearly about the whole situation and the trend of future development. In particular, we should let them know the state's needs and difficulties. In addition, we should work out economic measures and exercise administrative intervention when necessary. It will then be possible to solve problems.

2. In the Sphere of Circulation, It Is Necessary To Properly Combine Planning With Market Regulation

Let us begin with the supply of vegetables and nonstaple foodstuffs in cities. Some time ago, vegetables were in short supply and sold at high prices in the eight municipalities under the provincial authorities. We paid attention to this problem only when the masses expressed their dissatisfaction. Some comrades asked: Why is it that vegetables are sold at high prices when a bumper harvest has been reaped in agriculture? They said they did not understand the reason. From an investigation, we have discovered that the vegetable prices at present are subject to certain conditions: First, in the suburban areas, with the development of industrial and sideline production, people can earn a greater income from industrial and sideline production than from vegetable growing and therefore are more enthusiastic about industrial and sideline production than about vegetable growing. Second, with the prices of farm products raised, there has been a change in the ratio between grain and vegetable prices. Formerly, 100 jin of ordinary vegetable could be exchanged for about 40 jin of rice. At present, the same amount of vegetable can be exchanged for only 36-37 jin of rice. This dampens the peasants' enthusiasm for growing vegetables. In addition, for some time, large areas of vegetable fields were used for capital construction, and new vegetable plots have not been opened up. The provincial party committee laid down the rule that there should be 0.03 mu of vegetable land per capita in cities and 0.035 mu in Hefei municipality. However, this rule has not been put into practice. As a result, the state-run vegetable companies did not have an ample supply of vegetables and basically had to buy vegetables from trade fairs. In addition, illegal peddlers engaged in profiteering by raising the prices as they wished, resulting in a still shorter supply of vegetables. Vegetables are needed by urban residents every day, and their prices must be stabilized. How should this problem be solved? It can be solved only by persisting in placing the main emphasis on planned economy while giving market regulation a supplementary role. The deficiency of vegetable land should be made up through the principle of fixing output according to sales with output slightly greater than sales, and the major tasks for peasants in suburban areas should be clearly defined, so as to ensure supplies of vegetables and nonstaple foodstuffs for urban residents. Industrial and sideline production in suburban areas should be carried out by attaching greater importance to food than to other products. At the same time, second-line vegetable bases should be set up in the counties and townships near cities and in state farms and should be assigned vegetable supply tasks. The state-run vegetable companies (which can be operated jointly by communes) should control about 70 percent of the supply of vegetables and sell vegetables according to plan and at specified prices. The supply of a small quantity of coarse and sundry vegetables is to be readjusted through trade fairs. In this way, it will be possible to basically guarantee ample supply of vegetables and to stabilize prices. As a result of adopting this method, it was possible to basically stabilize vegetable prices during the last two festivals (the 1982 new year and the Spring Festival).

Nonstaple food supply chiefly includes meats, poultry and eggs, with emphasis on pork. Some time ago, there was a drop in the number of pigs sold to the state, and there was "difficulty in buying pigs." The main reason was that after the various forms of the responsibility system for agricultural production had been instituted, the quantity of fodder grain retained by the collective was not specified, and that importance was attached to grain, cotton and edible oil instead of to pigs, poultry and eggs when the production teams concluded contracts with the commune members. In addition, the peasants had more grain for personal needs, business was active in trade fairs and the peasants wanted to sell their products at high prices at these fairs. This impeded fulfillment of the state purchase quotas. Rural areas even purchased pork from cities. For this reason, it was necessary to persist in placing the main emphasis on planned economy while giving market regulation a supplementary role and to specify quotas for the purchase of pigs, poultry and eggs. The commune members were required to fulfill these quotas. At the same time, some plots were allocated for growing fodder, the peasants were supplied with fodder grain and fodder mix, chemical fertilizers were sold to the peasants as rewards, and coupons were given to the peasants with which they could buy a certain quantity of industrial products in great demand. These measures have recently begun to produce results and the number of pigs purchased by the state has also begun to increase again.

It is correct and necessary for the state to purchase agricultural products by dividing them into three categories by different methods. Agricultural products of the first category, such as grain, cotton and edible oil, are purchased and sold by state monopoly. The experience of many years shows that this method produces good results and needs to be upheld continuously. The plan for the minimum quantity of agricultural products to be purchased by the state can be fulfilled smoothly because the commune members have a clear understanding of the state monopoly on the purchase of agricultural products. Should there be a minimum quantity of products sold in excess of the state purchase quotas? It appears that there should be such a minimum quantity. As the state has raised by a relatively big margin the prices of products sold in excess of the state purchase quotas, the commune members wish to have a specific minimum quantity, which is laid down in the contracts for selling of products in excess of the state purchase quotas, and they undertake to fulfill such contracts. Practice shows that as long as we do our work meticulously, the commune members not only are willing but also want to sell more products in excess of the state purchase quotas. In areas where bumper harvests have been reaped, the commune members reflect that they have great "difficulties in selling grain, cotton and edible oil." We should do our work better to solve the problems concerning storage and transportation of farm products. This will meet the commune members' demand and be good for the state. In Huaiyuan County, the masses took the initiative in raising funds to build warehouses. They hope that the state will purchase greater quantities of farm products from them. Some localities are experimenting with a method in which the state purchases grain and the masses store the grain for the state. In localities where the state purchase plan and the plan for purchase of products in excess of the state purchase quota have been fulfilled, we should purchase the greatest possible quantity of farm products at prices of products sold in excess of the state purchase quota or at negotiated prices in trade fairs. With regard to grain and edible oil, we want the grain departments to act as a grain bureau and as a company for the purchase and marketing of grain and edible oil at negotiated prices and to keep two separate accounts, one for grain and the other for edible oil. Practice shows that this is a good method for stabilizing the prices of grain and edible oil at trade fairs. Over the past few years, the prices of grain and edible oil in trade fairs have remained rather stable and sometimes have even dropped below the negotiated prices. Cotton is usually purchased by supply and marketing cooperatives at prices of cotton sold in excess of the state purchase quota and not at negotiated prices. Agricultural products of the second category, such as tea leaf, tobacco leaf, silkworm cocoons, hemp, oil obtained from the seeds of paulownia, raw lacquer, rosin, pigs, poultry, eggs, feathers, rabbit hair and wool, are to be purchased according to the minimum quotas specified by the state, and these quotas should be fulfilled without fail. A rational ratio between the state purchase and the quantity retained for personal needs should be determined if it is inconvenient to fix the minimum quotas for certain varieties of these products to be sold to the state. After the minimum quotas have been fulfilled, some of these products are to be purchased by the state according to the ratio specified, some are to be purchased at prices higher than the prices of products sold in excess of the state purchase quotas, some are sold by reducing taxes to ensure reasonable profits, some are retained for processing or sold at trade fairs for personal profits, and some are processed into finished products. This is done according to the state's regulations and the concrete conditions in our province. Major projects are carried out according to planning and minor projects are carried out flexibly so as to ensure orderly and lively activities. Agricultural products of this category are of wide variety. Concrete regulations should be drawn up according to actual conditions. There should be different minimum purchase quotas for different varieties of products. There should also be different ratios between state purchase of products and retention of products for personal use, and different methods of reward for overfulfillment of minimum purchase quotas. This will fully arouse the enthusiasm of the producers. When conditions develop, some of the agricultural products of the third category will probably be relegated to the second category. Practice tells us that the scope of purchase through negotiations should not be too extensive. We are prepared to go further in studying and solving this problem.

With regard to the supply of industrial products, the means of production such as chemical fertilizers, fuels and machines which are supplied according to plan should be sold strictly at specified prices. Some localities cooperate in making industrial products, such as chemical fertilizer. With the consent of the department in charge of commodity prices under the State Council, the method of adding the transportation fees to the price may be adopted, and the marketing department may not demand extra charges. An urgent problem at present is that it is necessary to sign contracts directly with the peasants for the supply of raw materials so as to ensure that these materials can be directly supplied to the producers. With regard to the supply of industrial products used as means of livelihood, some essential products should be supplied according to the quantities specified by the state and some other industrial products which are in great demand should be supplied by the method of selling them to those who hold reward coupons. Experience in this respect needs to be further summed up in the course of practice.

3. Vigorously Grasping the Contract System Is the Key Measure for Placing Main Emphasis on Planned Economy

An economic contract is an agreement signed in the course of economic activities. On the basis of the state plan and the policies and regulations concerned and in the form of an agreement, it defines the duties shouldered and rights enjoyed by the two or more parties concerned. Such economic contracts were usually signed between industrial and commercial enterprises in the past. After various forms of the responsibility system for agricultural production were instituted, the contract system has been extensively adopted in the countryside to coordinate the relationship between various quarters, thereby manifesting the spirit of placing emphasis on planning, that is, "carrying out major projects according to planning and minor projects flexibly." This is a new thing born at a time when our country's socialist agricultural production has developed to a new stage. It has strong vitality. The broad masses of peasants in Anhui's countryside have now become more and more familiar with the contract system and are continuously improving and publicizing it in the course of practice. Practical experience shows that the following several points should be grasped in order to carry out the contract system well: First, it is necessary to pay simultaneous attention to the interests of the state, the collective and the individual and to manifest the spirit of combining responsibility, rights and profits. Responsibility, rights and profits are interrelated. It is necessary to manifest the peasants' duties and responsibilities for the state and the collective, such as fulfillment of the state purchase plan or the quotas specified by the state, and the retention of products for the collective. It is also necessary to manifest the state's duties and responsibilities for the peasants, such as supply of the means of production according to its plan, and the giving of rewards for overfulfillment of state purchase plan. Second, it is necessary to fix the minimum quantities of agricultural products of the first category to be sold in fulfillment (or in excess) of the state purchase plan and the minimum quantities of agricultural products of the second category to be sold in fulfillment of quotas specified by the state. Some of these quantities will remain unchanged for 5 years and some others for 3 years, it depends on the actual conditions and the terms written in the contracts to ensure fulfillment. Special documents should be transmitted to the grassroots level, specifying the methods of reward for overfulfillment of the quotas, and these methods should be made known to every household. Adopted by the 4th session of the 5th NPC, the "laws governing economic contracts" specify that spiritual encouragement and material awards should be given to those who have fulfilled their contract properly and that those who fail to fulfill their contract are to be educated and punished, so that the contract has a binding legal effect. Third, the effort to fulfill a contract should be taken as a part of the basic content of the system of personal responsibility of a grassroots cadre and as a criterion for testing the ability of a cadre of the economic department. In the course of carrying out the production responsibility system, many localities in Anhui simultaneously grasp the production responsibility system, the contract system and the system of a cadre's personal responsibility. This method still needs to be summed up and improved.

4. After the System of Responsibility for Financial Work at Various Levels Has Been Adopted, It Is Necessary To Specify the Minimum Quantity of Agricultural Products for Transfer to Other Localities and To Ensure Fulfillment of Tasks

The system of responsibility for financial work at various levels which is being carried out in the sphere of distribution has assigned to the organizations at various levels extra financial power and will arouse the enthusiasm of these organizations in grasping their work and earning greater income. It is a good system. However, we must strengthen our concept of the chessboard strategy for the national economy. We should not only conduct ideological education but also adopt concrete measures to ensure that various localities and levels undertake to fulfill their tasks of delivering agricultural products to the state according to the state plan. Effort should be made to arouse the enthusiasm of organizations at various levels on the basis of guaranteeing fulfillment of the state plan. The mistakes of "old factories having not enough work to do and new factories soliciting business in every possible way" must never be repeated. In particular, if the advanced factories have not enough work to do and the backward factories solicit business in every possible way, the state and the whole situation will be harmed. After fulfilling their state purchase quotas, the localities which produce raw materials should be allowed to run the processing industry. It would be the best if they process fine-quality products of famous brands in joint venture with the advanced localities. This will benefit the state as well as the advanced industrial bases and the raw material producers. We are experimenting with joint ventures with Shanghai in such a way that "the leaderships establish ties and the mass organizations join forces so that both parties are benefited and will work according to economic laws." We started our experiment with the textile industry and have set up the "Shanghai-Anhui Joint Exploration and Textile Company." This joint venture has just started and of course it will be some time before we can sum up experiences. Nevertheless, we and the comrades of Shanghai cherish a common desire, namely, through common efforts to break a new path in interregional unity.

5. It Is Necessary To Make Use of Various Economic Levers and To Exercise Necessary Administrative Intervention

When we say planning is the main aspect of the national economy, we are referring to the situation as a whole. In giving market regulation a supplementary role, a very important thing is to bring into play the role of prices as an economic lever. However, prices are not isolated. They are closely related to and cannot be separated from the role of revenue and credit as a lever. We have now adopted the following methods in making use of the role of prices as an economic lever: the specific minimum amount of products to be sold to the state according to the state purchase plan and that sold in excess of the state plan; the prices of products sold to the state according to the state plan, the prices of products sold to the state in excess of the state plan; and the negotiated or fluctuating prices. Being inexperienced, we are very carefully making use of the role of prices as an economic lever and summing up our experience in this aspect. We have just started to make use of the role of revenue and credit but, strictly speaking, we are not taking a bold approach. For example, we have adopted the method of reducing or exempting taxes for some kinds of products and have just started to raise the interest rate for long-term loans and increase the amount of money to be given away as loans.

In short, the use of the role of prices, revenue and credit as economic levers is a very complicated matter which we must handle very carefully. In my opinion, experiments may be carried out in different complexes. In one trade (from raw materials to end-products), between different trades or areas, and in agricultural-industrial-commercial complexes in cities and the countryside. We can acquire relatively comprehensive experience only from experiments of different types. At present, when the main emphasis is placed on readjustment, these experiments should be conducted within the microsphere and under such conditions which prevent them from causing a chain reaction in the macrosphere, so that the whole situation may be stabilized. Through these experiments, we can discover and resolve the contradictions arising in the course of improving the planned economy by giving market regulation a supplementary role. In this way, we can gradually open up a new path.

Administrative intervention may be exercised by adopting corresponding measures in light of the development of the situation. With regard to market management in particular, the leadership should join forces with the masses in strengthening price control, restricting and hitting at speculation and profiteering, stepping up the struggle against smuggling and intensively inspecting financial discipline and, when necessary, issue notices to ban illegal activities. We must learn to use political power to ensure that main emphasis is placed on socialist planned economy and to ensure orderly and lively activity.

6. It Is Necessary To Strengthen Ideological and Political Work and Strengthen Party Leadership

We serve the people and work in the interest of the people. However, there are the partial and the overall interests as well as the immediate and the long-term interests. Comrade Chen Yun recently said: It is imperative to improve the people's living. First, they should have food to eat and, what is more, have enough to eat. They should neither be too poorly fed nor too well fed. Second, construction work is necessary. A country will be hopeless if it consumes all its food and spends all its money. Only when its people have enough to eat can a country have strength to carry out its construction work and be hopeful. His words have fully explained the relationship between the people's partial and overall interests and their immediate and long-term interests. First of all, we should educate the cadres and at the same time strengthen ideological and political education for the peasants. We must view the situation as a whole and aim at long-term interests. We cannot modernize our socialist agriculture if we pay one-sided attention to immediate interests. To achieve this end, we must strengthen party leadership. Of course, we must improve party leadership before we can strengthen it. With the new situation developing in agricultural production, some good experience of the past is still applicable but some old methods are no longer useful and need to be improved. Some county party committees learned in 1980 that the former method of pressing people to carry out farming was inapplicable. They have proposed to conclude contracts in spring, to have the contracts fulfilled in autumn, to grasp rear service between spring and autumn, to train cadres by rotation in winter, and to carry out ideological and political work in light of various current tasks. They have acquired this experience in practice. This experience has proven to be sensible. Some people hold that as the peasants know how to do farmwork, leadership over them may be abandoned. The idea that the peasants in tilling the land can do without leadership, causing certain grassroots organizations to become lax and weak and let things slide, is mistaken. Our work methods must be improved, the party's leadership must be strengthened; we must give play to the functional role of the grassroots organizations and also give play to the role of the party branch as a fighting bastion. Only in this way can we strengthen socialist construction in the countryside and ensure fulfillment of various plans and tasks.

MAINTAIN AND CARRY FORWARD THE TRUE COLORS OF THE WORKING CLASS

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 15-18

[Article by Gu Dachun [7357 1129 2797]]

[Text] The working class is a leading force in the four modernizations drive. It is imperative for the working class to step up building and training itself to become a militant contingent which is ideologically advanced, technologically proficient, highly disciplined and united and cooperative, in order to adapt itself to the new situation and the new tasks and to play a principal role in building socialist material and spiritual civilization. A very important task in building the ranks of staff and workers at present is to conduct extensive and deep-going publicity and education among the numerous staff and workers. This will enable the 100-million staff and workers throughout the country to profoundly understand the inherent true colors of the working class and the way to carry forward the glorious traditions of the working class for the accomplishment of the historical mission of the working class.

The Chinese working class is the most progressive and revolutionary class in modern China and is the representative of the new productive forces. Over the past six decades and more, under the leadership of its vanguard, the CCP, the Chinese working class, while advancing along the course charted by Marxism-Leninism-Mao Zedong Thought, has undergone extreme hardships and difficulties over a long period of time and has been tempered in the two historical periods of democratic revolution and socialist revolution and construction. It has formed its own glorious traditions in class consciousness, ideological style and moral quality and reflected its own true class colors.

The true colors of the Chinese working class have been determined by the historical conditions of Chinese society. They find the most outstanding and concentrated expressions in the following aspects:

First, it is the most far-sighted and has the most thoroughgoing revolutionary character and steadfastness.

In old China the Chinese working class suffered from oppression by imperialism, the bourgeoisie and the feudal forces. With the exception of a pair of hands, it did not own a thing in the world. Only by completely overthrowing the reactionary rule of imperialism and the exploiting classes was it able to win national liberation and its own liberation. This class status and characteristic of the Chinese working class determined that it was the most far-sighted and had the most thoroughgoing revolutionary character and steadfastness. Its historical mission consists not only in smashing the old order but also in building a new one, in eliminating all systems of private ownership and the phenomena of exploitation of man by man and in placing the means of production under the control of all members of society. During the democratic period, it waged unremitting struggles against the three major enemies by advancing wave upon wave and pressing forward with indomitable will. A great many famous leaders of the worker's movement as well as a large number of fine sons and daughters of the working class laid down their precious lives in the struggles. The Chinese working class fought, failed, fought again, failed again, fought again, till it gained a complete victory in the democratic revolution. After the nationwide victory in revolution, the Chinese working class, as a strong pillar of the Chinese socialist cause, firmly took the socialist road, consistently opposed the various erroneous tendencies that departed from socialism and valiantly defended the socialist system. In the early 1960's, the Soviet hegemonists took advantage of the temporary difficulties suffered by the Chinese people and extorted us. Not fearing any ghosts nor believing in heresy, the Chinese working class straightened up, worked with a will and succeeded in overcoming all kinds of difficulties imposed on it, thus bringing credit to the Chinese people. The staff and workers of the Daqing oilfield were precisely the representatives of the thoroughgoing revolutionary spirit of the Chinese working class. By displaying the most tenacious spirit and overcoming numerous difficulties, they succeeded in building a big oilfield of an advanced international level and putting an end to the days when China had to rely on imported oil, thus making a major contribution to the socialist construction. There are numerous examples like this on various fronts.

Second, it is selfless and always puts the interests of the whole state and nation first.

By virtue of the historical era and its class status, the Chinese working class is fully aware that it is impossible for the working class to win final liberation by struggling for the interests of the class alone. It has closely linked its interests with those of all other exploited people and nations and has firmly held that only by liberating the whole of mankind will it be possible for the proletariat to finally liberate itself. It has always thought about China and the Chinese nation as a whole and waged valiant struggles for the prospects of the state and nation. After becoming the masters of the new China, the Chinese working class conscientiously shouldered the heavy responsibility of the leading class by always placing the national and social interests in the most important position and by striving to make the greatest contributions to the common cause of the people of the whole country. Millions upon millions of model workers, advanced producers and collectives are the people that best reflect the selfless spirit of being the masters of their own affairs. People are quite familiar with advanced collectives such as the "Mao Zedong" locomotive crew, Ma Hengchang group, Ma Wanshui engineering team and the Nos 1202 and 1205 drilling teams of Daqing as well as those famous advanced figures such as Meng Tai, Zhao Mengtao, Shi Chuanxiang, Wang Jinxi, Peng Jiamu and a great many people who are still working diligently for the socialist cause on various fronts. All of them have these common features: Their advanced ideas and deeds have exerted a profound influence on the people of the whole country and played a tremendous role in promoting the cause of socialist construction.

Third, it has the strongest sense of organization and discipline and is good at upholding and safeguarding the unity and unification of the revolutionary ranks.

The working class is linked with the great social production. The mechanical production and the division of labor in major industries naturally and closely link not only the workers of one factory but also the workers in different trades and areas, thus forming an industrial contingent with a high degree of concentration and organization. In the struggles against the enemy, there is mutual cooperation and help within the working class and efforts are made to achieve unanimity of action. This is the objective basis for which the working class has a much stronger sense of organization and discipline and a higher spirit of unity and cooperation than other classes. Since it entered the stage of the Chinese revolution, the Chinese working class has always, under the leadership of the CCP, plunged into the struggles as a unified contingent and has, therefore, cultivated a high sense of organization and discipline and a style of unity in struggle. In the 30-odd years of socialist revolution and construction in particular, the Chinese working class has always actively answered the various militant calls of the CCP Central Committee, resolutely implemented the policies and degrees of the party and the state, abided by the regulations and discipline in enterprises, obeyed all orders and played a fine exemplary role among the people of the whole country with its excellent style of strict discipline. The Chinese working class not only attaches great importance to its class unity, it also upholds, under the leadership of the party, the worker-peasant alliance and its unity with other revolutionary and patriotic forces.

From the aspects mentioned above we can attain a general understanding of the true colors of the Chinese working class. It is imperative for us to conscientiously and systematically sum them up and carry them forward.

Maintaining and carrying forward the true colors of the Chinese working class is of great practical significance to building the ranks of staff and workers. Generally speaking, the present spiritual outlook of the ranks of staff and workers throughout the country is healthy and the main aspect is fine. Since the CCP Central Committee put forth the great task of building a powerful socialist country with modern industry, modern agriculture, modern science and technology and modern national defense, the Chinese working class has been fully conscious of this major historical responsibility. In the readjustment of the national economy, in promoting stability and unity throughout the country and in building material and spiritual civilization, it has played an important role and made great contributions. At present, however, in the ranks of our staff and workers there are indeed some problems that merit our careful attention. First, since the founding of the PRC over three decades ago, the contingent of the Chinese working class has increased by about 20 times from several million to 100 million people. Over the last years in particular, great changes have taken place in the composition of the ranks of staff and workers owing to the fact that a number of old staff and workers have retired and that a large number of new workers are being employed in factories. At present, in quite a few enterprises young staff and workers under 30 years of age account for over half the total number of staff and workers. These new members have on the one hand strengthened the forces of the contingent of the Chinese working class and added new vigor and, on the other hand, inevitably brought within the working class the petty producer, urban petty bourgeois and other nonproletarian ideas and habits. Second, it is impossible to speedily eliminate the pernicious influence spread by the Lin Biao and Jiang Qing counterrevolutionary cliques during the decade of civil strife. Third, over the past few years our country has readjusted some policies and pursued an open-door foreign policy. This has enabled the decadent ideas and ways of life of the exploiting classes, particularly those of the bourgeoisie, to corrode the ranks of staff and workers more easily than they did in the past. For the above-mentioned reasons, it was inevitable that some negative phenomena should emerge in the ranks of our staff and workers. In a small number of staff and workers, the true colors of the working class have not been displayed so distinctly and they have been tinted in some respects with a motley of nonproletarian ideas. In addition to this, we have been weak and lax in our ideological and political work in the preceding period and slackened the ideological and political education of the ranks of staff and workers with the result that the negative ideas have not been rectified in time. The unhealthy tendencies manifested in some leading cadres such as bureaucratism and divorce from the masses have also encouraged the spread of these negative phenomena and adversely affected the initiative of the numerous staff and workers for socialism.

In the socialist modernization drive, it is necessary to build not only a high degree of material civilization but also a high degree of spiritual civilization. Both are closely linked and are inseparable from one another. Marx and Engels said that the ideology of the ruling class was always a dominant one in each era. Socialist modes of production and economic bases make it necessary to have a corresponding social ideology. This social ideology can only be one composed mainly of the ideology of the working class. What we refer to as socialist spiritual civilization should also be one with the ideology of the working class as the main body. As regards the new members that have joined our ranks, it is necessary for the working class to arm and transform them with its own ideology and, like a smelting furnace, help them to get rid of foreign substances. It should not let itself be tainted with small-producer, urban petty bourgeois and other nonproletarian ideas and habits.

It is necessary to maintain, carry forward and develop the true colors of the working class. With the advance of history, the working class should understand its new status and responsibilities and set new demands on itself. After the seizure of political power, the status of the working class undergoes fundamental changes and it becomes the master of the country and society. From that time on, the most fundamental task of the working class consists in being a good master of the country and society and building a new world. Therefore, the most important and fundamental condition in maintaining and carrying forward the true colors of the working class is to foster a high sense of responsibility as the master of its own affairs and take this approach in viewing everything.

As the master of the country and society, the working class should have firm conviction and full confidence in its own cause and have deep love for the party, socialism and the country. The abolition of exploitation and classes is the inexorable trend in the development of human society and no force on earth can stop it. The socialist modernization drive we are engaged in at present is a decisive step taken in this direction. We are bound to win in our cause. As regards this point, the working class should understand it most clearly. We suffered setbacks in the past and there are still a lot of difficulties in front of us but they are temporary difficulties. Since the 3d Plenary Session of the 11th CCP Central Committee, especially since the 6th plenary session that summed up historical experience and lessons, we have advanced smoothly again. If we lose sight of the law of historical development and the magnificent prospects for our country's development, limit our outlook because of temporary setbacks and difficulties, lose confidence, vacillate and become lax ideologically, we have adopted an approach not belonging to the working class.

As the master of the country and society, the working class should carry forward more fully its inherent spirit of selflessness. People not only work for themselves and their families, but also work conscientiously for the entire society. This is precisely the communist spirit. Every member of the working class should adopt this communist approach toward the state, enterprises, labor and work. We should regard the state and enterprises as our own by conscientiously sharing the burdens of the state and placing the interests of the state and the collectives above everything else. We should not regard our labor as merely a means to "earn money to support our families." We should not "view everything from the angle of money," be preoccupied with our personal gains and losses by "working according to remuneration" and thus reduce ourselves to the level of mercenary laborers. We should regard labor as a glorious cause for making more contributions to the society and for building a socialist new life. As regards some acts that have emerged in society, such as seeking private gain at public expense, engaging in malpractices for selfish ends and in speculation and profiteering, embezzling and stealing, we should resolutely resist them and wage struggles against them.

As the master of the country and society, the working class should resolve to wage protracted and arduous struggles for the vigorous development of the Chinese nation. On the basis of increased production, our livelihood will constantly improve. It is undoubtedly necessary to oppose the bureaucratic attitude of being indifferent to the weal and woe of the masses. However, in view of the fact that our country had a poor foundation to start with, we should, by adopting the approach of being masters of our country, make allowances for the temporary economic difficulties of the country and correctly handle the relationships between partial and overall interests and between immediate and long-term interests. We should learn from the spirit of the workers of Daqing of starting an arduous undertaking and be willing to bear great hardships and withstand doing hard work for the four modernizations. It is necessary to resolutely criticize and rectify the erroneous tendencies of some enterprises and units which, in order to accommodate themselves to the backward ideas of a small number of people and pander to their unjustifiable demands, damage the interests of the state and the collectives by various means.

As the master of the country and society, the working class should constantly strengthen its sense of organization and discipline. The promotion of socialist democracy and the strengthening of the sense of organization and discipline are not contradictory but complement each other. A high degree of democracy is precisely democracy for the broadest masses of laborers. It is undoubtedly very important to give play to the initiative of the working class as the master of its own affairs and ensure the exercise of this right. Naturally, we should have a high degree of both democracy and centralism. All members of the working class should make great efforts to become models of observing discipline and obeying orders. The working class as a whole should strive to become an industrial contingent that listens to the party's calls and strictly enforces orders and prohibitions. As regards bourgeois liberalization, extreme individualism and anarchy of every description, we should conscientiously see through them, resist them and make a clean break with them.

Just as it is impossible for a spontaneous worker's movement to engender scientific socialism, it is equally impossible for the glorious traditions and excellent quality of the working class to be spontaneously carried forward and handed down from generation to generation, still less to be spontaneously enriched and developed. To maintain and carry forward the true colors of the working class, it is imperative to rely on work in various aspects, particularly the key link of ideological education. At present, there is a tendency among some comrades to underestimate the importance of revolutionary theory and slacken the study of revolutionary theory. This state of affairs should be rectified. For every leader of an enterprise, maintaining and carrying forward the true colors of the working class should be taken as an important task in conducting ideological and political education among the staff and workers. Every staff member or worker should first of all attach importance to the study of revolutionary theory and pay constant attention to ideological remolding. The Chinese working class has turned itself from a class-in-itself to a class-for-itself and formed its own glorious traditions in several decades of struggles. This is the result of arming and nurturing itself with Marxism-Leninism-Mao Zedong Thought and is the result of remolding its own subjective world while changing the objective world. We should carry forward these glorious traditions and use revolutionary theory to arm ourselves, to remold ourselves and to rid some members of the working class of nonproletarian ideas.

In maintaining and carrying forward the true colors of the working class, the focal point of our work should be the younger generation of new workers. This generation of young workers has the merit of being full of vigor and vitality, good at thinking and quite capable of accepting new ideas and things. One of their defects is that they understand comparatively little about the working class and what it takes to become a qualified member of the working class. They have grown up and joined the ranks of the working class under a given historical condition. For a considerably long period of time we have not conducted among them a systematic education in the historical mission, glorious traditions and inherent quality of the Chinese working class. It is necessary to make up for this missed lesson. In the future, it is first of all necessary for the new workers to study this lesson well when they join the factory. All advanced elements in the ranks of staff and workers, including CCP members, CYL members, model workers and trade union activists should take the lead in maintaining and carrying forward the true colors of the working class and affect and bring along the broad masses, particularly young workers, with their model deeds.

Tested and tempered rigorously over a long period of time, the Chinese working class is a contingent with a very good political quality. The veteran workers, model workers and advanced producers are still a mainstay in this contingent. The new generation is also growing up sturdily. A number of advanced collectives characterized by the special features of the new era are emerging. We are sure that this trend will develop fairly quickly. Under the leadership of the CCP committees at various levels and with the concerted efforts of the numerous staff and workers throughout the country, the Chinese working class will certainly be able to make new contributions in the great struggles of developing the Chinese nation and add new splendor to its glorious traditions and revolutionary true colors.

SOME VIEWS CONCERNING CURRENT FILMMAKING

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 19-21, 40

[Revised article by Xia Yan [1115 5888] based on a speech delivered at the enlarged meeting of the Standing Committee of the Chinese Film Artists Association held in December 1981]

[Text] Since the 3d Plenary Session of the 11th CCP Central Committee, we all have a basically unanimous understanding of the situation on the film front. Our comrades say that 1979 was a year of crucial importance in China's film world. In other words, the year of the 30th anniversary of the founding of the PRC was a year when China's films began to revive on the ruins created by the "gang of four." Greater progress was made in 1980 than in 1979, and 1981 witnessed greater achievements on the basis of those in 1980. Generally speaking, the situation on the film front is taking a turn for the better. However, I am still not so optimistic. In the government work report delivered at the 4th session of the 5th NPC, Premier Zhao Ziyang pointed out that the situation of the national economy as a whole was fine but that there were still latent dangers. This is also the case with the movie industry. The general situation of the movie industry is fine but there are still latent or exposed dangers which are well worth our concern.

At the meetings of the film studio directors and on filmmaking held in 1981, I said that, compared with those in 1979, the films in 1980 made greater progress but that their quality was variable and that this was still a problem which merited attention. Among the feature films produced during the past years, those which are good or relatively good constitute a minority and most of them are "medium-grade goods" and some even "defective products" which are not up to standard. The best productions were given the Golden Rooster and the Hundred Flower awards in 1980. However, the films which are really welcomed by the broad masses of people are limited in number. Among the audiences there are divergent views on the award-winning films, such as "Legend of Mount Tianyun," "Evening Rain at Baoshan" and "Love at Lushan." Over the past years, we have participated in various international film festivals or in Chinese film weeks sponsored abroad. Very few new feature films have been presented in the competitions, and a considerable number of the feature films which were presented there were shot during the 17 years after the founding of the PRC, and there were even a few which were made before liberation. In a Chinese film week held recently in the United

States, the films presented were still such old films as "Sisters on the Stage," "Song of Youth" and "Liu Sanjie." In 1980, 82 films were produced. This figure cannot be regarded as too small. (Of course, in terms of the production capacity of our film studios, there is still an enormous potential to tap.) However, the problem of quality has become pronounced and deserves attention in the production of films at present. I have pointed out time and again that it is not difficult to start things in the world from scratch, be it material production or spiritual production. It is relatively easy to increase the quantity of films, but it is not easy to maintain fine and consistent quality. Before liberation, we were not in a position to produce any cars but now we are able to produce them. However, turning out credible "brand-name" products is not something that can be accomplished overnight. The greatest problem in our film undertakings is that the quality is variable and that there are no film studios that can ensure the "credibility" of their productions.

After the downfall of the "gang of four," quite a few film studios were set up in various localities throughout the country. Now 11 feature film studios have been formally approved and registered by the state. It is said that some departments and commissions under the State Council have also established their own film studios and furthermore even shot some feature films which were by no means connected with their profession. There is still a strange phenomenon: small film studios which were set up after 1978 have the equipment and apparatuses of the 1970's, while some of our old studios have equipment and apparatuses of the 1940's and 1950's. One may safely say that some equipment of the Shanghai Animated Film Studio is obsolete. Despite all this, they used this equipment to shoot such fine cartoon and puppet films as "Monkey King Turns the Heavens Upside Down" and "Nazha Wrecks the Seas." Besides, a lot of equipment and apparatuses which have recently been introduced from abroad by the film studios of the various provinces and municipalities have not been fully utilized, and some provinces and municipalities would rather keep them in stock than hire them out to the old film studios. Concerning this practice of selfish departmentalism, not only should the Ministry of Culture and the Chinese Film Artists Association speak out and make appeals, but those cadres who know how things stand should also uphold justice. At the Spring Festival get-together this year, I made a report on this situation to the leading comrades of the CCP Central Committee.

As for being production units, our film studios in general have overstaffing and a disproportionate number of nonproductive personnel. This state of affairs has been a drag on film undertakings. Of course, conditions differ greatly from studio to studio. For example, in shooting "Midnight," the Shanghai Film Studio took only 4 months and cost 500,000 yuan or more. In contrast there was a film where the actors were not so numerous and the scenes were not so vast; yet it was still not completed after 1 year and cost 1 million yuan. The cost of the film "House Filled With Happiness," which had the highest number of copies released, was only 300,000 yuan or more; that of "Nanchang Uprising," no more than 500,000 yuan; and that of "Seagull," which was widely acclaimed by audiences, 300,000 yuan. (Of course, as this last film was made by a cinema college, its case is somewhat exceptional.) The overstaffing and waste in our film undertakings can possibly be regarded as the worst in the world. Here I would like to mention in passing one piece of information for making a comparison. The Romanian State Film Studio has 1,500 staff and workers and annually produces 35 feature films, while our 4 old film studios, each having 1,000 to 2,000 staff and workers, annually produce no more than 50 feature films. This state of affairs must change.

Of the films produced in 1981, I have seen only 25 or 26. I feel that, compared with 1980, they have improved in quality to a certain extent, and the number of good or relatively good films has increased. Among the films on revolutionary and historical subjects that I have seen, "Nanchang Uprising" is perhaps the best. "Seagull" is also a very good production. It was shot a year before the Chinese women's volleyball team won the world championship. The director of the film showed considerable farsightedness. In addition, "House Filled With Happiness," "The Wound Has Healed," "Midnight," "Countryside Love," "Neighborhood," "The Wind and Clouds of Chutian," "The Toll of a Bell" and "Xumao and His Daughters" are relatively good. In particular, "Nanchang Uprising," "House Filled With Happiness," "Seagull" and "Neighborhood," which were shot singly by some new directors, have all, as I see it, surpassed the level of the 1960's. Of course, we must not forget that the scientific and educational, animated, and newsreel and documentary film studios have also put out quite a few fine productions.

However, we must realize that among the films produced in 1981, those which are good or relatively good do not yet account for a majority, and quite a few films are "medium-grade" and a small number of them are defective and wasted productions. This is the latent danger I am referring to.

In the 1981 productions, there was a negative tendency which I call a flood of romantic subjects. I do not mean to oppose depiction of love in films. Before the "Great Cultural Revolution," I fought for lifting the ban on the public showing and sending abroad of "The Young People in Our Countryside." However, the present situation is that some "condiments" of love have been arbitrarily included in any subject. This not only gives a strained interpretation and has nothing to do with content, but has even distorted the history of revolutions and tarnished the image of fighters. For instance, in "Pawns in the Revolutionary Armies," produced in coordination to commemorate the 1911 revolution, in portraying the revolutionary pioneer Zou Rong, the insertion of some plots of love affairs is forced. In the so-called adventure and detective films, such as "A Love Song in a Secluded Valley," for the sake of depicting love affairs, the image of the fighter is distorted and vilified. What is more, in order to obtain high box-office value, some films are filled with vulgarities and bad taste in depicting love. We must not remain indifferent to this tendentious problem. After suffering from the sabotage by the "gang of four" during the 10 years of chaos, the general mood of our society at present is not good. Film as an art of a mass character ought to propagate and advocate the socialist spiritual civilization and promote the favorable turn of the general mood of the society. Not long ago, when the CPPCC session was held, after seeing the film "Where Does the Guest Come From?" one veteran comrade said indignantly to me: "What kind of role do your films play: a role of transforming social traditions or that of corrupting public morals?" This remark carried a lot of weight and sounded the alarm to us. The reasons for the emergence of this tendency in filmmaking are many and complicated. But the main one is, in my opinion, that the leadership of the film studios has failed to make strict checks. At the same time, one-sided emphasis has been put on box-office value in pandering to the unhealthy practices existing in the society. Our present tasks are to strengthen political and ideological work, strengthen and improve the party leadership and strictly "make checks" before the commissioning of a film. At the same time, we must conduct serious, reasonable and well-intentioned criticisms against this unhealthy tendency in creation through the mass media. It is my hope that FILM ART, the theoretical publication of the Chinese Film Artists Association, will further integrate theory with practice and profoundly conduct theoretical research and carry out film review work in a practical and realistic way.

In filmmaking in 1981, there were still disproportions in subject matter. There were gaps in the presentation of many subjects, and even if there were some productions on different subjects, they were not of high quality. In 1978 I proposed that more films on agricultural subjects be made. By 1981, the productions on agricultural subjects had increased to a certain extent. As a result, there emerged such good films as "House Filled With Happiness" and "Laughter Over Moon Bay." But these productions on agricultural subjects have not significantly touched on the relaxed agricultural policies and reforms and the results of the implementation of such policies and reforms. The problem at present is that there is a shortage of film on industrial subjects. We cannot justify attempting to accomplish the four modernizations without producing any films on industrial subjects. Among the productions in 1981, "The Toll of a Bell" is relatively good, and "Men of Our Times" is passably good even though it is also "unable to rise above the convention" of excessive number of plots with love themes. In addition, very few people have written on scientific subjects. "Bi Sheng," a film on the life of an ancient scientist, was shot last year. However, there has been a lack of films on modern science. Despite being backward in both science and technology, our country has in recent years vigorously conducted scientific research and made significant progress. For instance, we developed a fine variety of new hybrid strains of long-grained rice and sent this technology to the United States in 1980. The successful development of "Lumian No 1" has brought about a rapid increase in China's cotton output and has reduced the annual importation of cotton which is paid in U.S. dollars. The leading comrade of the CCP Central Committee has said that our four modernizations program depends on both correct policies and the use of science. At present it seems that our scenario writers have not decided to reflect the new outlook on the scientific front. Apart from the excessive lack of productions on industrial and scientific subjects, there is still a gap in productions about youth. The youths constitute a great proportion of the total population of the country and are the main moviegoers. According to what I have read, a considerable portion of the crimes are committed by youths awaiting employment who are from good families. Because they lost the opportunity to study during the decade-long turmoil and lack knowledge and have not yet freed themselves from the bad influence of the "gang of four" and lack confidence in socialism, it is an important task for us to educate and foster the development of the younger generation. Efforts to this end should be exerted in making scientific, educational and newsreel films. Feature films, being dutybound all the more, must shoulder this task.

At present, the industrial front, agricultural front, and trades and professions all over the country are enthusiastically preparing for the production work of the new year. We expect our film studios to give good consideration to their annual and quarterly plans, try their utmost to increase the quality of films, shorten the production cycle, reduce costs and broaden the scope of subjects as much as possible. In film creation, more attention must also be paid to economic results, and more consideration must be given to serving the people and socialist construction rather than to serving box-office value.

Here I would like to especially mention the question of leadership in film undertakings. Apart from the leadership of the film bureau under the Ministry of Culture and the various film studios, we are also referring to those in charge of the Chinese Film Artists Association. It is essential for us to strengthen our studies, raise the political and ideological level as well as the professional level, and shoulder the responsibilities entrusted to us by the CCP and the people in a conscientious, practical and bold way. The fundamental reason for the emergence of variable quality, defectiveness and wastefulness in the movie industry lies in the failure to make checks before the commissioning of films or the failure to have the courage to make serious checks. The reasons for this state of affairs are many: First, people have failed to distinguish problems owing to the limitation imposed by the level of their understanding. Second, they are afraid of upholding principles even if they see the problems. Third, they do not have an understanding of the real situation and only trim their sails to the wind in doing things. As I see it, all this can be summed up in two words: The first word is the word "fear," that is, they are afraid of making mistakes, of offending others and of making a mess of "relationships." Besides, they are reluctant to make any comments even if they discern the problems because the author might be famous and the director might be well-known. In terms of the choice of subjects, for the sake of "playing safe," they shoot films on ancient themes. The other word is "selfishness." With selfish motives and the idea being the "one who tries not to offend anybody," they try not to interfere or they give more consideration to box-office value and profit sharing. They are unwilling to shoot films with good content but without any romantic and thrilling plots, being afraid that the films will not be attractions. Film studios rejected the script adapted from "Ni Huanzi," the representative work of Comrade Ye Shengtao. It is hoped that our comrades will have enough courage, fear nothing and get rid of selfishness. Before a film is commissioned, full consideration must be given to the thousands upon thousands of viewers and the social effect of the finished production. It is necessary to pay attention to principles rather than friendship. I hold that our film studios should shoot films that are beneficial to the masses of people and socialism even though they do not attract a large audience.

It must be noted that individualism and the desire for personal fame and gain are now quite serious problems in the literary and art circles including the film world. Not only do some young people openly scramble for fame and profit, but the veteran comrades who did very well in the past are now also tainted with this defect. It is distressing to mention matters of this kind. In terms of scripts, the practice of "pairing off goods," a phenomenon originally existing in the commodity market, has emerged. A certain writer had a good script and the film studio wanted it. Then the writer attached the condition that one of his comparatively poor scripts should be included in the contract. A certain film studio made an appointment with a writer for a script. Later the script turned out to be useless. The studio decided not to make it into a film but paid the writer his usual contribution fee. However, the writer insisted that he should be given the so-called "remuneration for service rendered." Some people who only read a script, make some suggestions or insert some remarks for others, demand that their names be listed with the author's and ask for a share of the contribution fee from the original author. Recently, "winds of plagiarism" and "winds of assuming the identity of another person" have emerged in the literary and art circles and the film world. Could such things have been done openly before the "Great Cultural Revolution"? Owing to the damage done by the "gang of four" to social ethics and prevailing customs, those individualistic ideas which could not be brought to light in the past now seem to have become "publicly lawful." We must not allow this unhealthy tendency to spread and develop. The literary and art workers must, first of all, set demands on themselves to ensure at least a modicum of spiritual civilization.

Finally, I would like to use a term used in sports circles, that is, we must not be content with our achievements: we must "start from the very beginning" and start with ourselves. Every one of us, and first and foremost those comrades who have leadership responsibility, must set a good example for others.

What I have stated above are my impressions of the present situation, which might be a bit extreme. But for the sake of China's film undertakings--for the sake of Chinese films, which have an audience of nearly 50 million--I believe that the film workers will excuse me for making some unpleasant remarks.

A CORNER OF THE CHINESE COUNTRYSIDE

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 22-28

[Report by Mu Qing [4476 7230], Guo Chaoren [6753 6389 0086] and Lu Fuwei [7120 2133 3634]]

[Text] When we once again drove to the countryside of the western Sichuan plain on a visit, despite the bleak and chilly midwinter of the south, everywhere we felt a sense of a spring full of vitality with spring breezes caressing our faces.

In Guanghan, Xindu and Qionglai--three trial-point counties where the Sichuan Provincial CCP Committee is carrying out the reform of the agricultural system--this sense of spring seemed especially strong. This was not because the winter crops in the vast fields were revealing the splendor of life. No, what we felt was far richer and more far-reaching than the beauty of the spring of nature....

To be sure, in today's countryside, there are no longer the grand occasions on which, in years gone by, there were huge crowds of people with a deafening sound of gongs and drums, but in the open spaces in front of and behind people's houses, there have silently grown new thick and luxuriantly green bamboos; beside the once thatched cottages, batches of new buildings with red bricks and green tiles have sprung up; trucks in an endless stream are carrying a steady flow of commodities out of the newly run enterprises of the communes and the production brigades; the newly bought crockery and cupboards of each and every family of peasants who have for many years worried about food problems are now full of grain. Over the ends of the villages, the corners of the fields and the rural trade fairs, the clouds and mist of anxiety which shrouded people's faces all the year round have disappeared and have been replaced by cheerful smiling expressions full of enormous pride in their success.... Now it can be perceived everywhere that people are soberly pondering, honestly working, exploring, and creating solidly and farsightedly. Everywhere the spring of hard work, progress, self-confidence and hope is in the air.

The era which Comrade Mao Zedong envisaged and worked for with intense emotion more than 20 years ago, an era in which as the masters of the country, full of vigor, daring and energy, the working people would write down the newest and most beautiful words and draw the newest and most beautiful pictures, has eventually tiptoed in quietly like unfettered sights and sounds of spring piercing the constricting layers of ice created by the "leftist" mistakes, since the 3d Plenary Session of the 11th CCP Central Committee. Although the three counties we visited constitute only a small corner of the Chinese countryside, they truthfully reflect the new look of the Chinese countryside that has emerged since the 3d Plenary Session of the 11th CCP Central Committee, just as a drop of water reflects the radiance of the sun....

I

Guanghan and Xindu, which are located in the hinterland of the western Sichuan plain, and Qionglai, which is located at the edge of the plain, all, in terms of natural conditions, belong to the "land of abundance" where floods and drought have been tamed by man's wishes and will and where there have been no crop failures all the year round since ancient times. But during the eternal night of old China, natural disasters and manmade disasters went hand in hand here and poverty and hunger existed side by side. The so-called "peaceful and happy" and "well-provided-for" "reign of peace, order and prosperity" has invariably been a magnificent image in the minds of the working people. Only after the storm of the great revolution of the people under the leadership of the CCP swept across every corner of the land could the working people free themselves from the fetters of the feudal system and enter for the first time a brand-new era in which the working people are the masters of their own fate. During the 8 years between 1949 and 1957, the total agricultural output value of these 3 counties increased by 50 to 100 percent and the economic income of the peasant masses registered a corresponding increase of 150 to 200 percent. Many peasants who formerly did not possess a speck of land moved into new houses when they got married and started their career; some totally illiterate people sent their children to school for the first time; large batches of advanced peasants became members of the CCP and quite a few fine elements of the peasantry assumed leading posts both in the CCP and the people's government. With regard to the myriad peasant masses, the rising socialist system has from its very start displayed, for all to see, its great, tangible superiority.

However, as a river which flows vigorously must detour round soaring mountains and forge ahead in twists and turns, the road of historical development has by no means always been smooth and perfectly straight. At a time when the Chinese peasants in their hundreds of millions engaged in a great pioneering undertaking to transform China with full confidence, the deviations in our understanding of the objective world and the errors made in our guiding ideology caused the surging development of the Chinese countryside to suffer a serious setback. In 1958 there emerged the "Great Leap Forward" throughout the nation. This movement, which was originally aimed to propel the rapid development of the productive forces, was accompanied by such "leftist" mistakes as "high quotas," "harmful directives," "a wind of boasting and exaggeration" and a "communist wind," with the result that things went contrary to our wishes.

In order to thoroughly get rid of the situation in which people were perplexed and harassed by floods and drought generation after generation in history, in the "Great Leap Forward," full of daring, the broad masses of peasants carried out large-scale construction of water conservancy works with a spirit that could conquer mountains and rivers. People used extremely primitive, simple and crude implements of production to cut across extremely high mountain peaks which had been in a deep sleep since time immemorial, to intercept the 1,000-li destructive river which roared all the year round. What a noble and heroic spirit of daring to be the masters of nature they displayed! How great was the enthusiasm and creativeness they displayed! But the leadership which was divorced from reality, and the lack of experience in our work, brought this battle against nature to an extremely confused conclusion. On the one hand, people dared to think and dared to act and achieved a lot of marvelous results; on the other hand, they indulged in the wildest fantasies, thus causing incalculable losses and waste in manpower, materials and finance.... People on the western Sichuan plain will never forget this grievous experience. Many county and commune leading comrades are resolved to cherish these lessons as their "precious heritage" and are determined never to follow the same old disastrous road. On the bank of the Caijia River in the Nanbao mountainous area of Qionglai County, there stands erect to this day a small blast furnace which was constructed in the years of the "Great Leap Forward." The mouth of this furnace, which spat out dense smoke in those days, is covered with green grass. A certain unit wanted to dismantle it and use the refractory bricks for other purposes, but a cadre who took part in the construction of the small furnace and later became secretary of the commune CCP committee firmly disagreed. He said: Let us keep it as a souvenir. This is a key protected historical relic of our mountainous areas. Let all coming generations remember that we must never again commit such follies which tire the people and drain the treasury....

The wounds left by the "Great Leap Forward" were gradually healed and agricultural work again developed normally in accordance with the guidance of the CCP. Unfortunately, the "unprecedented" 10 years' catastrophe then started. This time, the leftist mistakes and the damage done by the Lin Biao and Jiang Qing counterrevolutionary cliques caused our country and people to suffer the most serious setbacks and losses since the founding of the PRC. For the peasant masses on the western Sichuan plain, it was nothing but a stifling nightmare. The argument "to be poor is glorious and to be rich inevitably leads to revisionism" became an "absolute truth," and "mass struggle" became "revolutionary laws and regulations." Multifarious "methods" to rectify the "spontaneous forces" prevailed across the countryside like hailstones covering the sky.... Despite all this, to develop agricultural production and support the state's construction, our peasant masses still took great pains to carry on their work under hard and difficult circumstances with a firm and persistent spirit of holding back their grievances for the sake of shouldering more important tasks. They proved to be highly conscious sons and daughters of the Chinese people who have received the education of the CCP for many years! What an epic struggle people carried out against the leftist mistakes and the sabotage carried out by Lin Biao, Jiang Qing and their ilk in Guanghan, Xindu and Qionglai in order to build a new socialist countryside! While the fruit trees they cultivated for years were cut down as "capitalist tails," some old poor peasants quietly cultivated new saplings in covered corners, holding back their grief and indignation. Quite a few grannies toiled day and night to collect hen eggs basket by basket. Time and again they were branded as "upstarts" and "models of speculators and profiteers," but they still continued to breed more hens without uttering a sound. Many hardworking, honest and tolerant team leaders were branded repeatedly as "capitalist roaders" who sabotaged the practice of "taking grain as the key link" by organizing the masses to develop sideline production and boost economic income, but once they regained their freedom, they continued without the slighest vacillation in their determination to follow the road of "all-round development," a road pointed out by the CCP.... People can see what a firm and unshakable trust and loyalty to the CCP these peasant masses and party members have! What a noble and pure sense of responsibility for the country and the nation they have! This is the essential reason why the foundation of our agricultural collective economy did not collapse and our agricultural production could still keep going with enormous efforts during the long-drawn-out 10 years of internal disorder. This is also the essential reason why our agricultural situation has been able to advance by leaps and bounds and why our agricultural production has been able to take the lead since the 3d Plenary Session of the 11th CCP Central Committee.

Of course, during our visit to these three experimental counties on the western Sichuan plain, we did not find that people wallowed in the past sufferings and they were not willing to expose any longer their past wounds. However, like a traveller who makes a long and arduous journey, if he does not review the footprints he left behind on the old wrong road, it will be difficult for him to be sure of correctly taking a new road. Huang Yiyuan, secretary of the Xindu County CCP Committee, a middle-aged cadre who has engaged in agricultural work for more than 20 years, said in an interview: If we fail to sum up the harm and lessons of our past mistakes in a serious and responsible way, we will be unable to carry out today's correct line boldly and forcefully. Huang Yiyuan held that the most important one of the numerous mistakes was that we failed to recognize that the peasant masses were the real masters of the countryside. The masses were banned from doing what they were willing to do and were forced to do what they were unwilling to do. Who are the real heroes? Who is the motive force who propels history? This fundamental principle of historical materialism had been turned upside down.

True, the suppression and encroachment on the position and rights of the peasant masses being the masters of the countryside is the key reason for the slow development and even stagnation of agricultural production for a long time in the past. During the 20 years between 1957 and 1976, in Guanghan County, the average grain ration received by every peasant from collective distribution increased by only 27 jin, with the annual increase in grain production averaging 1.3-odd jin. The income every peasant received from collective distribution increased by only 23 yuan, with the annual increase averaging 1.1-odd yuan. Life was even harder for the peasants of Qionglai County. Quite a number of the communes and their subdivisions had to depend almost every year on "grain resold to them by the state" and "relief grain" to eke out their existence. It was unexpected that this rich and populous county with green hills and clear water, which is located on the ancient commercial road, and had found favor in the eyes of a host of poets and artists for the much-told historical romantic story of Sima Xiangru and Zhuo Wenjun, should become a place where "the cattail grows so vastly and thickly that even the devils are afraid of it." Located on the outskirts of Chengdu, Xindu County was originally a "land of milk and honey" on the western Sichuan plain. By 1976, of the 2,400 production teams throughout the county, 1,786 production teams were "teams of paupers" in which the masses generally had difficulties in their lives.

II

Seen from the agricultural work of the three counties of Guanghan, Xindu and Qionglai, although the downfall of the "gang of four" concluded the disastrous years politically, the "leftist" fetters and handcuffs still shackled the vast countryside in terms of the economy, and particularly in terms of the economic management system. The roots which gave rise to the "arbitrary issuance of orders," the "communist style" and the practice of "eating out of one big pot" were not eliminated. "Leftist" ideas and methods still wandered and haunted every corner of the countryside like a spirit that refused to leave....

The date of 18 December 1978 will be recorded in history in indelible writing, the date when the 3d Plenary Session of the 11th CCP Central Committee was held. The complete set of Marxist line, principles and policies adopted by the session have given, like rolling spring thunder shaking the vast sky, new life to a countryside which was in a state of hibernation.

After the peasant masses threw off the "leftist" shackles binding their hands and feet, their spirit of historical initiative burst out like a long-dormant volcano. It is precisely this historical initiative that has successfully solved the difficult problems which had not been solved for many years in the countryside. It is also precisely this historical initiative that has profoundly changed the traditional concepts of peasants "sticking to old ways" and being "selfish and ignorant," which have long existed in people's minds.

The various forms of the agricultural production responsibility system which have today spread all over the country are the outstanding creation of the peasant masses. The experimentation and popularization of the production responsibility system in Sichuan was first carried out in Guanghan County. In the past, Chang Guangnan, secretary of this county's CCP committee worked assiduously in the movement to "learn from Dazhai" and made certain achievements, thus enabling Guanghan County to become an "advanced county" in the province, a county advanced in "learning from Dazhai." But the agricultural production and the livelihood of the peasants of the whole county did not basically improve. This put Chang Guangnan in a painful dilemma. He thought: Even a pig which bumps into a south-facing wall knows how to turn its head, let alone a man! But as to how to turn back, he did not have a clear idea. Once he came by chance to a "backwater" of the border region and found that the crops of a certain production team generally grew better than those of other production teams and the daily distributed work value of the team was much higher than that of other teams. After being repeatedly mobilized and sincerely asked for advice, the old team leader, who was more than 60 years old, hesitated a little and then revealed his "secret weapon": It is very simple! Once the quotas for farmland plots are determined, assign the fixed quotas to some operational units under a contract and practice the method of reward for overfulfilling the production tasks and penalties for failing to meet the quotas. Chang Guangnan proposed that this method be carried out in a commune first as an experiment but his proposal met with strong opposition. Later a "lawsuit" was brought to the provincial CCP committee and the key responsible comrade of the provincial CCP committee personally gave the final verdict: The masses must be allowed to carry out the method if they are willing to; those who are full of worries may carry it out on a smaller scale and those who have no worries may carry it out on a larger scale. As a result, this "undercurrent" which already existed among the peasant masses was drawn up and flowed from Guanghan to the western Sichuan plain and then to the whole of Sichuan Province. In the course of its advance, through additions and creations of the masses in various places, this method developed into various forms, such as specialized contracting, assigning production targets to each laborer, fixing output quotas for individual households and full assignment of responsibility. This was indeed a powerful irresistible current! Wherever it flowed, here it submerged the "revolutionary workpoints" and the "work of sitting idle" and there it burst the "individual grain ration" and the practice of "eating out of one big pot." The output and value of the "irritating fields" and "painful plots" which had been regarded for long years as not being able to feed their population suddenly increased in geometric progression....

In the three counties on the western Sichuan plain where experimental work on reforms was carried out, the most impressive thing was the changes in the peasant masses themselves. Those who had a worried look in the past are now wreathed in smiles; those who walked with their heads low in the past now walk with longer steps and with their heads held high; those who when attending a meeting hid themselves in the corner of the meeting halls like young daughters-in-law in the past have now mounted the platform to pass on their own experience in becoming the "most outstanding" men; those whose "grain ration was reduced" and who were "fined" and "paraded through the streets" and "exposed before the public" have now become indispensable great able persons in rural socialist construction. In the No 10 production brigade of Sangyuan commune in Qionglai County, there is a young peasant who had not displayed any astonishing abilities for a long period of time in the past. But after an integrated enterprise combining agriculture, industry and commerce was established, he led a batch of young people to live in a camp on the wild Heihu River bank, building from nothing, using the yellow sand and broken stones of the beach to produce prefabricated building components. Their production value last year was more than 200,000 yuan. Thus he has become the director of a famous local building materials factory. There is another young peasant who many times was a major target of "criticism" and had to sell his house to go out to lodge a complaint and appeal for a redress of his wrongs. This finally resulted in his utter destitution. But he has now become the deputy manager of the Heihu Riverbank Integrated Enterprise of Qionglai County, the production value of which is more than 2 million yuan, and concurrently the manager of a supply-and-marketing company and an able leader in developing agricultural production and boosting the rural economy. Some ordinary peasants of Shibantan commune in Xindu County successfully achieved rotational agricultural production of cross-planting by fully utilizing the specific growth properties of various crops, thus creating the "most outstanding plots" in terms of high output and high value which are well-known throughout the province.... Tens of thousands of various talented people, such as "paddy specialists," "experts in fruit trees," "models in eliminating insect pests," "silkworm and mulberry enthusiasts," "managers of fish," "commanders of rabbits" and "living Lu Ban's" have sprung up like bamboo shoots after a spring rain.

After the peasant masses became the masters of the countryside politically and economically, they could no longer tolerate the backward and ignorant situation in which their forefathers had for ages been cut off from science and technology. This led to a new high tide of acquiring literacy which is sweeping across the vast countryside. Many years ago, the departments concerned of the CCP and the government launched activities to spread cultural and scientific knowledge. Despite mobilization work at each level and sometimes even a resort to compulsory study, there was only a limited number of people who were really interested. In the past years, Xindu County printed 2,000 pamphlets on agricultural science and technology and gave them to people free but very few people took interest in them. Thus the materials just piled up on the office tables. Recently 30,000 study books of the same kind were printed and they were completely sold out to the peasant masses in a very short time. At present, people can see colorful "posters," "requesting" particular agricultural technological knowledge. They are posted everywhere on the walls of quite a few rural market towns. Wherever the agricultural technical personnel who were sent by the counties went, they were invited by the peasants to their homes and treated as "distinguished guests." Some communes ran short-term training classes on agricultural science and technology which were originally aimed at training production team cadres, but these classes were more often than not attended by crowds of peasants as visitors. Sometimes the crowd was so big that it could not fit into the room. They had to kneel down outside the windows to "secretly study" science and technology.... Truly, the time of the peasant masses wanting to be the masters of culture and science has come.

III

The present recovery of the Chinese countryside from a state of prolonged disorder is not and should not be a simple restoration of the situation of the early 1950's. What needs to be corrected is not only the erroneous policies and measures but, more importantly, the management system which for a long time has not been completely rational.

Not long after the 3d Plenary Session of the 11th CCP Central Committee was held, this corner of the Chinese countryside began to experiment with a reform of the rural system. The Sichuan Provincial CCP Committee formulated that the guiding ideology of this reform should be that the peasant masses are fully encouraged to be the main force of the reform and that the road for the reform should be explored in the light of their local specific conditions. The provincial CCP committee repeatedly and clearly stressed that the CCP committees at a higher level were not encouraged to impose any unified patterns or unified road on these three counties. Likewise, the county CCP committees of these three counties were also not encouraged to impose any unified measures or unified ways on the communes and their subdivisions. Because of this, in the experimental reform work, the main work of the CCP committees at various levels was chiefly to transmit the line, principles and policies of the CCP Central Committee to the peasant masses. Thus, the masses could have full discussions and deliberations and carry out some experimental work voluntarily in an active and steady way. The CCP committees then had to help the masses to constantly sum up their experiences and help them to keep on perfecting and improving. After a certain period of practice, the reforms in the three counties had individual emphases and individual methods with their own characteristics. Guanghan County first separated government administration and commune management, established the three fronts comprising the party committee, the government and the economic leading groups, and then proceeded to the structural reform of the economy. Xindu County started with socialization and division of labor according to specialization, and carried out a series of activities of specialized cooperation breaking down the barriers between different administrative organizational systems and different divisions. It then advanced to the divorce of government administration from commune management. Qionglai County started by paying attention to the economic integrated complexes combining agriculture, industry and commerce, organized various forms and various scales of economic complex with different systems of ownership and eventually broke down the barrier formed by the integration of government administration with commune management. These three methods have, in terms of effect, fairly successfully overcome some defects existing in the rural management system and reached the same goal by different routes.

The only criterion to test truth is practice. The criterion for testing the success or failure of this social reform is the social productive forces.

Over the past 20 years, the annual average increase in the total industrial and agricultural output value of Guanghan County was 6.84 million yuan. But over the last 3 years the annual average increase was more than 34 million yuan and the growth rate was thus 5 times greater than that in the past. The annual top limit of bank savings deposits of the peasant masses in the past was 1.7 million-odd yuan, but it has now jumped to more than 10.3 million yuan, an increase of more than 5 times.

During the 30 years from liberation to 1978, the average per capita economic income of the peasant masses in Qionglai County registered a total increase of only 32 yuan. But over the last 3 years, this has increased by 78 yuan. The increase achieved in 3 years has surpassed that achieved in 30 years.

In Xindu County, 757 poor production teams noted as lacking both money and grain 3 years ago have disappeared from the statistical table. Large batches of the "most outstanding" teams rich both in money and grain have come to the fore, each trying to overtake the other in friendly competition. The average per capita production value of some of the "most outstanding teams" has exceeded 2,500 yuan, thus substantially surpassing the level of an "affluent family," a level which the Chinese people are assumed to reach by the end of this century....

Arithmetic symbols are not as charming as beautiful verses, but what we have cited here are by no means common statistical figures. They are the records of an era and a profile of the society. From the background to these figures, we can see that substantial and profound changes have taken place in the vast countryside. People can sense the powerful blast of the socialist trend which is surging ahead....

One might well ask why such a profound social change has been so smooth. Indeed, this is a matter which gives us much food for thought. Over the last 3 years, the CCP committees and governments of these three counties have neither made loud cries as in the past nor sent any huge work teams to the countryside to lead the reform. But an invisible reform vitality has been gradually permeating every corner of the countryside, as was described by an ancient poem: "Following the wind, vigor sneaks in by night. Silently it brings life to all things on earth." Furthermore, wherever it permeates unprecedented changes will take place. Where does this gigantic force come from?

In various interviews and discussions, the cadres at various levels of these three counties unanimously agreed: the key was that this reform tallied with the actual needs of the countryside. That is to say, the reform measures enabled the production relationships to suit the development of the productive forces. This reform reflected the fundamental interests of the peasants and was thus warmly welcomed by the peasant masses.

In the mountainous areas of Qionglai County there is a commune named Xinmin. During more than 20 years in the past, in building "Dazhai plots" and "mellow-soil fields," this commune wantonly destroyed mountain forests, thus reducing the 400,000 cubic meters or more of timber reserves by half; there was still insufficient grain to eat; those who lived in the mountains fled to the plains; and as the population was smaller life was harder. Reform began here 2 years ago. Decisions were made to make forestry a priority, establish an integrated enterprise combining forestry, industry and commerce, cultivate medicinal materials, develop animal husbandry, weave coir mats and coir ropes and comprehensively utilize forest products. With this change, the people in the mountains who could do nothing but hand in blank slips of paper to their accountants in the past now have to use bags to take away their renminbi. We should like to ask: Can there really be any peasants who do not genuinely and sincerely support this kind of change?

"Once the reform is carried out, everything will go more smoothly." In these three experimental counties, the initial agricultural system reforms have resulted in a corresponding and profound change in the rural work in various fields. In addition, changes are continuing to take place at an irresistible speed. The thinking and work style of cadres have changed; the attitude of the masses to the cadres has changed and the relationship between people which was full of indifference, estrangement and vigilance for a period of time in the past has changed. Many commune members enthusiastically told us that since the 3d Plenary Session of the 11th CCP Central Committee, the party organizations at various levels had become "more close and respectful" and the socialist road had become "more reliable and beloved." In Xindu County, there is a peasant who in the past lived on red Chinese trumpet creeper and on resold corn throughout the year. Now he always has pork and rice to eat and two liang of qu wine to drink. Every time he is tipsy after meals, he will "gossip" with dancing eyebrows and radiant face and say: In the past I was afraid that the party would ask us to "reach the socialist standard," because that would mean tightening our belts and being criticized and attacked. But today I have come to realize this socialism is actually very easy and comfortable and the party leadership is actually fine!

IV

Of course, there is no way that any historical change can make everyone content. The peasants now have enough to eat and wear, a state of affairs which they have been seeking for many years, day and night; and they can display their skills to the full and have bright prospects ahead. But those who are used to "eating out of one big pot" condemn this flagrantly. Moreover, man's understanding of the objective things is not immediately identical with truth. When things develop in spirals and we judge them from the appearance of a small part of the development, this will indeed give people a false impression that things seem to turn back and even retrogress. The "epic" scenes in which people went to work in close military order with bells ringing and whistles blowing have now been replaced by idyllic and pastoral tableaux. In addition, a handsome amount of grain in excess of the fixed quotas and the banknotes obtained for the products of sideline production have directly gone into people's storehouses and pockets without any "discussions" or "approval" by any organization. A peasant of the Honghuang Integrated Enterprise in Qionglai County recently built a beautiful new two-storied building, which was very much admired by the urban people. One visitor asked the master of the new building: "How large a loan did you get?" Unexpectedly, the master of the house threw out his chest and said: "You're joking! I still haven't spent all the money I have in the bank." This is incredible! Because of this, some people have begun to look upon the practice of "dividing the fields and working alone" and the "polarization of rich and poor" as terrible things. They are not sure whether this powerful trend which is now cleansing the Chinese countryside is, in the end, the demons and ghosts of capitalism or the flying dragons and dancing phoenixes of socialism.

To observe the run of a mountain range, it is necessary to stand in a position higher than that of the mountain. A certain amount of time is needed to weigh up the significance of this reform. However, in this corner of the Chinese countryside, owing to an early start and rapid development, the orientation of advance and the trend of development of Sichuan's three experimental counties of rural reforms have revealed themselves quite distinctly. A host of hard facts have shown that the peasant masses who suffered great hardships through feudal exploitation will on no account divorce themselves from the road of collectivization pointed out by the CCP. What they have resisted and opposed is nothing but the egalitarianism and bureaucracy existing in our work. Even under such forms of responsibility system as fixing output quotas for individual households and full assignment of responsibility, the practical and realistic peasants realize that it is not profitable to "contract out" certain work to individual families or households. This work includes the selection and breeding of fine varieties, the forecasting, prevention and cure of plant diseases and elimination of pests, and the raising of rice seedlings in hothouses for paddy cultivation. While practicing specialized contracting, Xindu County made the best use of the situation and set up specialized service companies, such as companies responsible for seeds, plant protection, accounting and agrotechnology, signed contracts with the teams, groups, households and able-bodied laborers engaging in specialized production and practiced unified management and unified distribution among them. This has ensured that all styles of "individual management" have close relationships with the collective economy which is based on specialization and socialization. What we have seen in this corner of the Chinese countryside is precisely this interesting fact. Along with the gradual development of the reform of the rural management system, the peasants of Guanghan, Xindu and Qionglai no longer engage in unitary agricultural production. Instead, on the condition of fulfilling the state purchase tasks, they have, by using local materials, processed agricultural and sideline products, put their products into the market and subjected the profits they thus gained to unified distribution in the communes and their subdivisions. Thus they have begun to break away from the relatively poor historical position resulting from the situation where the peasants only produced, handled and sold raw materials. It is quite obvious that in the situation where the collective economy is developing at a rapid pace, the honest peasant masses will definitely not indulge in the wild fantasy of dividing the fields and working alone!

In this corner of the Chinese countryside, great previously unseen and unheard of changes have made us deeply believe that this system reform is a miraculous cure for rapidly healing the gaping wounds caused by the "leftist" mistakes. It is also a fundamental measure for thoroughly putting an end to the various dishonest practices which have existed for many years. In the past, the economic power in the communes and their subdivisions was in the hands of a small number of cadres. A doggerel went: "A commune member will get a scolding before he manages to borrow money, while for a cadre, one word will be enough for him to borrow money." Even though "cleaning up economic matters" was taken as the key content of the movements launched repeatedly in the past, the unhealthy practices of a section of cadres, such as corruption, theft and embezzlement, were still not successfully curbed. Since the reform of the management system was carried out, things have completely changed. A deputy team leader of a production team of the Zhuyou commune in Xindu County wanted to borrow 300 yuan but the specialized accounting unit which has achieved "specialization in accounting" refused to lend him the money. The deputy team leader had to ask the party secretary of the production brigade to sign the loan approval, but the accountant still sternly refused and said: "According to the regulations of the financial system of the communes and their subdivisions, those who wish to borrow more than 10 yuan must submit a request for the discussion and approval of a general meeting of commune members." The deputy team leader had to give up. Furthermore, in the counties engaged in experimental reform, the general meetings of commune members, the representative assemblies of the masses and the stockholders which are held regularly every year not only discuss and determine production plans and plans for the distribution of income but also criticize and commend as well as select and remove cadres. Thus they are smoothly solving this "longstanding, big and difficult" problem which could not be solved by various campaigns in the past.

In this corner of the Chinese countryside, the past irresistible trend that "those who live in the mountainous areas move to the plains and those residing in the countryside go to the cities and towns" has begun to take a turn for the better. In some places, there has even emerged a suggestion of a "reverse flow." Retired workers from the cities have gone to the communes and their subdivisions on invitation to be technical advisers. Young people awaiting employment in the cities and towns have settled in the countryside by groups. Of them, quite a few have become active factors in building a new socialist countryside. The social problems which have remained unsettled for many years despite repeated appeals have naturally taken a heartening favorable turn. How can those who take a skeptical attitude toward the rural system reform not draw any inspiration from this?

Like all progressive changes in history, the reforms initiated in this or that corner of the Chinese countryside are by no means the subjective wishes of any one person. Rather, they are the objective demands of the development of the productive forces and the inevitable result of the advance of the times. Although the reforms are just a beginning and quite a few measures are still in the exploratory and experimentation stage, the huge momentum initiated by the reforms will inevitably open up a new road which is practical and realistic and suited to China's national condition, a road which will develop socialist agriculture.

IT IS NECESSARY TO CONDUCT SYSTEMATIC EDUCATION ON MARXIST THEORY AMONG THE CADRES

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 29-30

[Article in "Theoretical Study by Cadres" column by Wang Huide [3769 1920 1795]]

[Text] In the 60 years' fighting history of our party, a large number of advanced communist fighters emerged in our revolutionary ranks. They had an unswerving faith in the communist cause and believed that the communist ideal was bound to be realized. They had a clear-cut proletarian world outlook. They thought that to contribute their whole lives to the communist cause and to fight for the people's liberation and happiness was the most significant and valuable thing in the world. So they were able to overcome all kinds of hardship, failure, setback and severe frustration. They were able to firmly persevere in this cause without any vacillation and feeling of being disheartened. Under favorable conditions, they were able to keep a sober head and resist the corrosive influence of bourgeois ideology. Maintaining the true qualities of advanced communist fighters, they did not seek private interests but worked heart and soul for the party's cause and worked hard for the people's interests and happiness. Thanks to the heroic struggle of these thousands of advanced communist fighters, together with the broad masses, our party not only was able to achieve victory in the revolution, but also was able to lead a great nation such as ours with a population of 1 billion to vigorously carry out socialist construction free from the plight caused by various errors of ours and the sabotage of counterrevolutionary cliques.

The emergence of these advanced communist fighters group by group was a sign of vigor and strength in our party's cause. The long-term education on Marxist theory conducted among them by our party was an important reason for their progress. Marxism is the system of Marx' viewpoints and his theories. Marxism is an integrated and perfected world outlook based on Marx' theories on historical materialism, on surplus value and his scientific socialist theory. The more a cadre understands Marxist viewpoints and theories, the clearer and the firmer his ideal and faith will become, and thus his world outlook can be based on a reliable scientific theory. In the early days of the new China, our party conducted education on elementary Marxist theories, especially historical materialism--the history of social development--among the broad masses of cadres, intellectuals and young students. This was a great help in forming their scientific world outlook. After undergoing all kinds of hardship and frustration in the last 30 years and more, even suffering undeserved mental injury, many of them did not waver at all in their faith, and they have not lost any courage in the struggle. All the time, Marxism was their reliable spiritual prop, which encouraged them to make a determined effort. Now, they have become the backbone and the hard core on all fronts of socialist construction. This convincingly shows the great power of Marxist theory, and also the necessity of conducting systematic education on Marxist theory among cadres.

Over the past 10 years and more, a large group of new cadres have joined our ranks. In general, a considerable number of them lack Marxist theoretical training. They have not systematically studied dialectical materialism, historical materialism and Marxist theories on political economics and scientific socialism. This has hampered them from forming a Marxist and scientific world outlook. Not only have the ultraleftist trend of thought and false Marxism of the "gang of four" influenced them, but all kinds of bourgeois ideology, such as bourgeois viewpoints on freedom and democracy, egoism, anarchism and even social Darwinism, have had a considerable impact on them. Owing to their lack of theoretical weapons to fight against these wrong ideas, they have at times been unable to do anything but stand in confusion, hesitancy and vacillation. For this reason, it is imperative to conduct systematic education on Marxist theory among these cadres. They must make up for these missed lessons.

Over the last two decades, the serious sabotage by Lin Biao, Kang Sheng and the "gang of four" of theoretical education work among our cadres is the main reason for their lack of knowledge of Marxist theory. Beginning in the 1960's, Lin Biao clamorously advocated his reactionary pragmatism. He objected to the systematic study of Marxist theory; instead, he advocated "taking a shortcut in study" to "learn things which can be immediately used" and he required that "the results should be seen immediately." He even separated Marxist theories into dozens of fragmentary and unrelated quotations, and applied them indiscriminately. He claimed that "this can make a thousandfold profit with only a small capital." This was not only the most wanton trampling on Marxist theories, but also rescinded all the Marxist theoretical education among the cadres, and disarmed the cadres of all their Marxist theories, thus putting them in a position where they were powerless to resist the influence of various erroneous ideas.

It is now 5 years since the "gang of four" was smashed. The state of affairs whereby the cadres lack Marxist theory should be immediately remedied. The regular system of conducting theoretical education on Marxist theory among the cadres should be reestablished. It is necessary for every cadre to have a chance to receive systematic education on Marxist theory, to grasp the basic knowledge about dialectical materialism, historical materialism and the Marxist theories on political economics and scientific socialism. We should consider how to establish such a theoretical educational system for the cadres: the study of the elementary theory of the three components of Marxism should be made a required task for cadres. Every cadre must fill the gaps in his knowledge. Both their on-the-job study and their study when taking leave from their jobs temporarily should be carried out so that they can receive the necessary and systematic theoretical education. An examination system should be established to inspect and appraise the results of their study.

Of course, there is still more work to be done in order to establish a regular system for the cadres' study of theory. According to their different educational levels and theoretical levels, we have to compile and select all kinds of teaching, reading, and guidance materials. This is an arduous task. We should train theoretical teachers and instructors, set up spare-time political schools, and strengthen the work in all party schools and political schools. The party's propaganda departments should strengthen their work of organizing and guiding the cadres in their study of theory. By so doing, we can create favorable conditions for establishing a regular system for the cadres' study of theory.

The reestablishment of such a system is an important affair relating to many fields. It is our hope that our cadres can come to consider this problem and put forward their proposals.

LEADING CADRES MUST TAKE THE LEAD IN STUDY

Beijing RED FLAG in Chinese No 4, 16 Feb 82 p 31

[Article by Commentator]

[Text] Our leading cadres at all levels shoulder the heavy task of guiding the modernization drive and conducting ideological and political work for the cadres and masses. Compared with ordinary cadres, it is therefore all the more important that leading cadres study Marxist theory. In recent years, as advocated by the central authorities, many cadres have studied theory afresh, and the atmosphere of serious reading of books and study of problems by the leadership groups has started to become pronounced. This is very good to see. However, many leading cadres are still in a state of "studying in a perfunctory way on account of being busy with work all the time." This trend of the failure to attach importance to theoretical study is not at all commensurate with the duties and responsibilities of a leader. It must be changed.

Certain leading comrades are content with just reading party documents; they reckon that it will be all right so long as they act according to the documents and that there is no need for theoretical study. It is essential to read the documents and understand the party's various principles and policies in order to do a good job in leadership work. However, this cannot take the place of theoretical study. All the correct principles and policies set down or expressed in the documents have Marxism-Leninism-Mao Zedong Thought as their theoretical basis. If one lacks theoretical knowledge and accomplishment, one is prone to lack a deep and penetrating understanding of the party's principles and policies, and just know that things are so without knowing the reason why. In these circumstances, it is difficult to carry out the principles and policies correctly, and one might even waver in work. Generally speaking, documents can only give work guidance in principle; in order to truly do a good job in work in one's area or department, it is necessary to apply the stand, viewpoint and method of Marxism-Leninism-Mao Zedong Thought to analyze the actual situation and solve the actual problems. Comrade Liu Shaoqi pointed out, if a leader lacks knowledge of Marxist theory, he cannot independently decide on the orientation. He held that cadres of this type "are not competent cadres." These words are still worth pondering deeply.

Some comrades do not attach importance to theoretical study because they feel that they have their own experiences. Experiences are very valuable, but without theoretical guidance it is not possible to sum them up very well and to analyze which of one's experiences are correct and which incorrect, to enable one to continually enhance ideological awareness. Moreover, as the objective situation is constantly developing, and new situations and problems are ceaselessly cropping up, if one is satisfied with one's previous experiences and makes no effort to study theory or master the laws for economic construction and other work, so as to avoid narrow-mindedness and one-sidedness in understanding, one may make mistakes in work in addition to being unable to do leadership work well.

The main reason why certain leading cadres study very little is because they are busy with work. It is a fact that many cadres are busy. However, in order to produce practical and effective results from being busy, it is essential to be good at "snatching a little leisure from a busy life" and persist in study. Even the numbers one and two men, whose work is the busiest, can still set aside some time for study if they improve their work methods a bit and cut out some unnecessary meetings. Naturally it is necessary to spend some time on study, but with one's standard of theory genuinely enhanced, one will greatly reduce blind actions, heighten awareness, improve efficiency, embark on fewer tortuous roads and end up actually saving some time. An old saying fits the case: Sharpening the knife does not interfere with cutting up the firewood.

For leading cadres to take the lead in studying theory is beneficial for promoting theoretical study by all the cadres as well as helping themselves to do a good job in work. Only if the principal leaders in a unit attach importance to theoretical study and are accustomed to studying well, thinking deeply and mastering theory can they lead the cadres forward, form a pronounced study atmosphere, and do well in promoting and implementing organizational and theoretical guidance work for cadres' theoretical study. A 1964 Central Committee document on organizing high-ranking cadres to study the works of Marx, Engels, Lenin and Stalin pointed out: In reading books, it is necessary to advocate the airing of views, writing of notes and feelings, and the writing of an article on every book one reads. We should advocate this point afresh today. In the past many leading cadres not only took the lead in study; where possible they also provided guidance for the cadres' study by delivering reports and answered the questions they raised in the course of their study. We should also revive and carry forward this good tradition.

DO SOLID WORK AND ADVANCE IN STEADY STRIDES--NOTES ON READING COMRADE CHEN YUN'S ECONOMIC WRITINGS

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 32-35

[Article by Liu Xiyao, secretary of the Sichuan Provincial CCP Committee]

[Text] Recently, I had the occasion to reread Comrade Chen Yun's economic writings and to recall once again the tortuous road which the socialist construction in our country had to travel and also to look back on the triumphant course which our party has taken since the 3d Plenary Session of the 11th CCP Central Committee. All these reminiscences have been very endearing. Following a year's actual practice, the work undertaken by the party Central Committee in implementing the policy of further readjusting the national economy has achieved notable successes. It will be useful to make a correct appraisal and summation of the experiences gained in the past year and more. In this article, I shall write about my own understanding and comprehension.

1. The further readjustment of the economy has brought about a good situation. As Comrade Chen Yun said: Our readjustment this time is a sober and healthy one. We shall do solid work and continue to advance in steady strides. Indeed, this has been thoroughly verified by the actual experiences over the past year and more. The implementation of the policy of further readjustment makes it necessary for those enterprises which should step back to step back sufficiently. This will necessarily affect the speed of development of the national economy. But to partially reduce a false speed will give place to a speed which can give the nation and people even more actual benefits. It is not retrogression but actually an advance.

In Sichuan Province, owing to the rather heavy fall in industrial production in the first quarter of last year, some comrades were a little skeptical of the policy of further readjustment. In our opinion, the relatively large decline in industrial production in the first quarter of last year was largely owing to the lack of a correct understanding of the policy of further readjustment. What should not have receded was made to recede and ideology was lax. The policy of further readjustment was by no means the cause. But it is not sufficient merely to understand this. The most important cause was that we lacked a sufficient understanding of the serious consequences that had been brought about by "leftist" errors. We failed to see the hidden dangers in the national economy and the problems that could arise. Ideologically we were not prepared and, caught unawares, we had to resist passively.

Last year, despite the setback in the first quarter, subsequently we followed the instructions of the party Central Committee, braced ourselves and our spirit, took a number of measures and, even under such conditions as an extreme energy shortage, a serious lack of work assignments for heavy industry, a severe flood disaster and the disruption of communications and transportation, we still managed to attain a growth rate higher than originally planned. At the same time, the economic structure has gradually become more rationalized. Naturally, the consequences brought about by a prolonged period of "leftist" errors could hardly be eradicated within a comparatively short period of time, although the general situation was becoming better day by day. This amply confirmed the correctness of the policy of the central authorities. If we had not carried out the further readjustment of the economy and if, politically, we had not implemented important policies and a series of measures to achieve further stability, the good situation of today would not have existed. At the same time, this verified the reasoning expounded by Comrade Chen Yun that while it is not good to allow conservatism to impede the speed of progress which construction richly deserves, it is much easier to rectify conservatism than to rectify adventurism.

2. The anxiety for results and for speed frequently ends in tardiness. Comrade Chen Yun long ago pointed out: In order to develop the national economy more rapidly, we must display equal concern for economic construction and the people's life. The two must be balanced. Over a rather prolonged period, this balancing work will be rather strenuous. It is rather difficult for both construction and the people's life to be in easy circumstances. What Comrade Chen Yun expressed here was a conclusion based on the objective laws governing socialist economic development and derived from factors such as our country's large population, the relatively large proportion of people in the countryside, and the backward economic conditions.

In the past, under the guidance of the "leftist" erroneous ideology, for a prolonged period the scale of our construction exceeded the capability of the nation. Although compared with other countries in the world, the speed of the development of our national economy was not slow, the country and the people have not received any substantial benefits. On the contrary, a serious imbalance in the proportionate relationships of the national economy has resulted. The people's life has been affected and national construction has likewise been affected. We have been compelled to undertake big readjustment work on two occasions and the speed of development has been lowered.

There cannot be any adventurism in construction. Can there be adventurism in bettering the people's standard of living? The answer is no. In both cases, we must act according to our ability. In early 1957, Comrade Chen Yun, referring to the conditions at that time, pointed out that there must be a rise in the people's purchasing power but that the amount of the rise had to conform with the available supply of consumer goods and the rise should not be too rapid. The people's standard of living should be improved, but this should be done gradually following the progress of production development. Therefore, we cannot be too hasty. Since the 3d Plenary Session of the 11th CCP Central Committee, actual practice has again verified this truth. Since both matters must be attended to and must be mutually balanced and since the balancing work is strenuous, we must resort to thrift and economy, to improving economic results and to achieving appropriately proportional relationships. We should strive to enable the people to fill their stomachs and at the same time do construction work. We must ensure that after the people have filled their stomachs the state still has sufficient resources left for construction work. If we only pay attention to construction and neglect the improvement of the people's standard of living, not only will the people's enthusiasm be adversely affected but also their purchasing power will not be able to be raised and production and construction will not be able to develop more rapidly. Conversely, if the people live too comfortably and eat and spend everything, then the state will be incapable of undertaking construction and the economy and culture will not be able to develop more rapidly, while the improvement of the people's standard of living will not be able to be sustained. Therefore, we must earnestly carry out investigation and research and find out the governing objective laws. We must then follow these objective laws studiously. Should we rely solely on subjective wishes and anxiously want quick results, then tardiness in lieu of rapidity will invariably result. We must earnestly learn from this often-repeated historical lesson.

3. The planned economy should come first and market regulation, second. All along this has been advocated by Comrade Chen Yun. In order for both national construction and the people's standard of living to be attended to at the same time and for the national economy to develop more rapidly and in a stable and sustained manner, we must have planning, and proper proportionate relationships and we must seek an overall balance. The modern economy is complex and complicated; its links follow each other closely. Just as Comrade Chen Yun said, failure to achieve an overall balance will result in one being unable to move a single step. Without an overall balance to coordinate development, basically there cannot be any development speed, much less any great economic effect. The superior nature of the socialist system is found in that it takes the planned economy as the center and market regulation as the supplement and that it treats the whole country as one big chessboard and work is done in line with a unified plan. Because in the past many "leftist" errors were committed under the pretext of adherence to planned economy, some comrades, on hearing the party Central Committee's call to reaffirm planned economy as the main task and to treat the whole country as one big chessboard, were worried that the economy was heading toward a dead end again and wondered if retrogression was on the way. Obviously, planning was clearly misunderstood.

During the first 5-year plan period, we completely copied the Soviet Union's methodology in planned economy. Aiming primarily at the problems of that time and taking into consideration the actual conditions of our country, Comrade Chen Yun put forward a superb thesis, urging the institution of three main bodies and three supplementary bodies. Unfortunately, at that time we did not act according to his correct views. Before 1958, there existed many problems of overcentralization and too-tight control, while in 1958, in the course of thorough emancipation and under the slogan of wiping out superstition, we broke with certain scientific concepts which should not have been eliminated. We gave no thought to planning or to work according to a proper ratio. Rather, we set "high targets," instituted the "Great Leap Forward," and indulged in the thought that "once a horse starts galloping, other horses will follow." Afterward, we started the so-called "going in for something in a big way," and encouraged the provinces to set up independent and integrated industrial systems of their own. We refused to talk about an overall balance or "treating the whole country as one big chessboard." Construction of many projects was hastily decided upon without first having undergone thorough investigation and research or scientific examination, or there being an assurance that an overall balance would be achieved. In summing up historical experiences, we cannot fail to see two aspects, namely, that most people are prone to more readily understand the problem of overcentralization and of too-tight control, while many comrades fail to pay sufficient attention to "leftist" errors such as neglecting planning, neglecting to ensure work according to a proper ratio, and failing to achieve an overall balance.

We should never make planning guidance and market regulation oppose each other; nor should we upset their respective main and supplementary roles. In planning, we should first consider the need to satisfy the material and cultural demands of the people. We should endeavor to grasp the conditions of the market and give due consideration to the stability and sustained growth of production and the general improvement of the people's standard of living. In formulating a plan, we must include in the plan the factors and the role of market regulation. It is a mistake to draw up a plan which exercises excessively rigid control. If this is done, it must be rectified. At the same time, we must give full play to the regulation and supplementary role of the market, as we are doing now. However, we must never allow market regulation to get out of control and oppose the plan. Free production and free trade which are divorced from the unified plan and from the collective interests should not be condoned.

4. Only in doing solid work and following the prescribed order can we attain a rapid development of the economy. This embraces the spirit of Comrade Chen Yun's recent talk. Back in 1962, he said: Only in working out an overall balance on a "short-line" basis can there be a real overall balance. For a prolonged period of time there has been a controversy between a so-called active balance and a passive balance. But, what is an active balance? One interpretation is that only in working out a balance on a "long-line" basis, that is to say, a balance with gaps, is there an active balance. This interpretation considers Comrade Chen Yun's "short-line" balance as conservative and passive. In reality, in the final analysis, the so-called "long-line" balance cannot balance. That is to say, there is no balance in it at all. This is precisely why there has been so much extravagance in economic construction. Seeking a "short-line" balance means that we must acknowledge reality, do solid work and achieve a real balance. Whether we are active or passive depends on the attitude we have taken toward the "short-line";

whether we fully understand it and handle it real earnestly or leave it alone and treat it lightly; and whether we resort to thousands of ways and means and actively press forward to change the "short" into "long," or are content with the present status, lay undue stress on objectivity, and do nothing.

The precise object of the party Central Committee in advocating the policy of readjustment, restructuring, reorganization and upgrading and in undertaking the further readjustment of the national economy is to face squarely the defects, weak points and problems in developing our national economy and to take appropriate measures to rectify them. It demonstrates the party's real sense of responsibility for national construction and the people's standard of living. In working hard for the prosperity of the country and going all out to achieve progress, we must grasp the focal points and the weak links of these problems. We must work solidly, in a planned manner and step by step, to overcome difficulties and solve problems. We must attain a development speed which can bring to the country and the people more real benefits and relatively high economic results, and thus find a new road for the socialist economic construction of our country. Socialist economic construction is a science. Like all sciences, it has no "short-cut" road to success. Only in not fearing hardships and difficulties and in solidly working according to scientific laws can we reach the peak of success.

THE POTENTIAL FOR ACHIEVING BETTER ECONOMIC RESULTS AS SEEN FROM THE MANAGEMENT OF ENTERPRISES IN SHASHI MUNICIPALITY

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 34-36

[Article by Mu Changsheng [4476 1603 3932], secretary of the Shashi Municipal CCP Committee]

[Text] In his government work report delivered to the 4th session of the 5th NPC, Premier Zhao Ziyang pointed out that, in order to develop our national economy, we must blaze a new trail characterized by a more practical speed and better economic results, yielding more substantial benefits to the people. He also put forward 10 principles for economic construction which we must follow while trying to blaze the new trail. The crux of these 10 principles lies in the problem of improving economic results. This is also a key problem in socialist industrial management. In his government work report, Premier Zhao explicitly said, "In order to tap the potential of existing enterprises, secure better economic results and increase state revenues, it is imperative that the all-round consolidation of enterprises be carried out in groups and in a planned way." Seen from the situation of the development of industry in Shashi, it is completely necessary to implement this principle.

While appraising the economic results achieved by an enterprise, we mainly consider the amount of labor used for producing a given amount of products. Provided the quantity and the quality of products are the same, the smaller the amount of labor used, the better the economic results. Therefore, in order to improve its economic results, an enterprise should take management measures to properly mobilize and organize all personnel, funds and materials, and thus bring their roles into full play.

Modern enterprises engage in continuous mass production, which involves complicated types of work and various work procedures. If any one of these procedures, which closely interlock with each other, goes wrong, all the production procedures will be interrupted. In order to keep the production going in an orderly and harmonious manner, on the one hand, the workers must be required to maintain a high sense of responsibility and fulfill their duties with an overall point of view and a hard-working attitude; on the other hand, production management must be strengthened and improved.

However, at present, there are a considerable number of industrial enterprises in which the management is extremely unsuitable for modern production. The equipment of many enterprises in Shashi has been improved and become more advanced as compared with that in the 1950's and 1960's. Particularly in recent years, many enterprises have greatly increased new equipment, carried out renovation and transformation, and introduced some new techniques and technology. This has greatly helped to improve the productivity and promote the industrial development of the whole city. Over the last 5 years, the average yearly industrial growth rate in Shashi was over 20 percent. However, owing to the drawbacks existing in some enterprises, such as weak management, disorderly production arrangements, lax labor discipline and serious waste, the existing manpower and material resources cannot be fully utilized. According to a sample survey, in most of the enterprises, 15 to 20 percent of the potential for increasing production has not been tapped and the percentage of untapped potential for decreasing consumption is even higher. This shows that there are still a large number of problems in the field of economic results in the industrial enterprises.

Recently, we studied the data concerned and took the textile industry in Shashi, which forms a major part of this city's industry, as an example to compare with the same trade in Shanghai. We found that the average use of funds by each worker in Shashi in 1979 was 10,705 yuan, or 137 percent higher than that in Shanghai, which was only 4,500 yuan. However, the average contribution of taxes and profits by every worker in Shashi was just 5,528 yuan, or 34 percent lower than that in Shanghai, which was 8,300 yuan. As far as the equipment and other production conditions are concerned, the textile industry in Shashi is not worse than that in Shanghai, and is even better in some aspects. The reason for its low economic efficiency lies in ineffective management.

The reasons for this situation are many-sided. As Premier Zhao pointed out in his government work report, the subjective reason mainly lies in the long-standing "leftist" errors "existing in our guidelines for economic construction. They prevented us from acting in conformity with objective economic laws in many of our efforts. Coupled with the disruption during the decade-long 'Cultural Revolution,' this could not but seriously hamper us in giving play to the superiority of our socialist system and it could not but impede our economic construction and detract from its results." It can be seen by looking at Shashi's industry that, for a long period of time, owing to the "leftist" influence, many enterprises in expanding their reproduction did not put inner improvement first but put outer expansion first. The ineffective management in these enterprises resulted in high consumption, poor product quality and low income. Although the production growth rate seemed quite high, the economic results were not satisfactory. Over recent years, after implementing the principles of readjusting, restructuring, reorganizing and upgrading the national economy, many enterprises have changed their production guidelines and paid more attention to improving their management, and they have achieved a certain improvement in economic results. However, there are still a number of enterprises which have not actively shifted their emphasis from outer expansion to inner improvement and have not consistently paid attention to improving management. As a result, the potential of these enterprises has not been fully tapped. This cannot but impede the improvement of their economic results.

How should the principles raised by Premier Zhao in his report be implemented so as to further readjust and strengthen the enterprise management and thus improve economic results? We found the following problems needing immediate attention.

In order to improve economic results, it is necessary to effectively use work time and raise the utilization rate of working hours. Every worker must cherish his work time. If he does not work conscientiously and responsibly in his working time, the number of products he can make will become fewer and time will be wasted. This will further result in higher unit cost of products, reduced economic efficiency and benefits, high wages, and increased management expenses and other expenditures. At present there are enterprises in which the utilization of work time is not good. For example, in the Shashi valve plant, the management of which is comparatively advanced for this city, the rate of attendance in the first half of 1981 was only 85.2 percent and the utilization rate of working hours was just 74.4 percent. As regards the whole city, things are much worse: the utilization rate of working hours was only 50 to 60 percent and the rate in some enterprises was as low as about 40 percent. Faced with this situation, we must start by straightening out the enterprises, raise management levels, consolidate the working organization, tighten labor discipline, and firmly eliminate liberal and lax tendencies among the labor force. Along with this, we should implement and perfect the economic responsibility system, set down reasonable production quotas, lay down and put into effect rules and regulations, and perfect measures which comply with the principle of distribution according to work. At the same time, we should strengthen ideological and political work, so as to enhance the workers' sense of responsibility and their consciousness in making full use of their working hours.

In order to improve economic results, we must attach great importance to enhancing the workers' technical level and the cadres' management level. As the degree of mechanization increases, the division of labor becomes more and more elaborate and the relationship between workers becomes closer and closer. This requires that cadres have higher management skills and workers have higher technical quality. If the management capability and operation skills cannot keep pace, no matter how sophisticated the equipment is, it will not help achieve good economic results. Last September we made a survey of the economic activities of the textile industry in this city. We found that, in the No 1 Knitting Mill, the equipment utilization rate in the period from January to September was 70.89 percent, or 5.74 percent lower than in the same period of the previous year; the equipment operation rate in that period was 81.6 percent, or 10.9 percent lower than in the previous year. Just on the basis of these two changes, the output value decreased by 3.22 million yuan and the profits decreased by 580,000 yuan. The main reasons for the above problems lie in the fact that a large group of new workers who entered the factory lacked technological training and they were not good at operating the new advanced equipment. Meanwhile, production management was not able to adjust to the new conditions. This proves that leaders and managerial personnel must master the know-how pertaining to managing a modern enterprise. At the same time, the workers' technical quality should be enhanced. Relying on the help of older workers, and by strengthening the technological training of the whole staff, we should ensure that every worker becomes proficient in one or several production skills and is able to operate the advanced equipment skillfully. It is also necessary to study the advanced experiences of other people in the same trade, try by all means to adopt advanced technology, and carry out technological transformation and innovation on a large scale. In this way, we will be able to greatly improve economic results.

In order to improve economic results, it is necessary to try by all means to reduce the consumption of materialized labor. Production needs to consume a given amount of raw materials, fuel and power. Consumption within quotas is reasonable and effective, but that part above quotas is unreasonable and ineffective consumption. This seems very simple, but quite a number of enterprise leaders have not paid due attention to it. In the first half of 1981, enterprises in Shashi increased consumption of electrical power by 14.17 million kwh, of coal by 1,493 tons, of raw oil by 1,560 tons. In the same period, in the 10 state-owned textile enterprises run by the municipality, 13 of the 20 major consumption indexes increased over those in the previous year. As a result, profits in the first 8 months of 1981 decreased by 2.08 million yuan. Owing to the waste caused by the substandard products, another 1 million yuan was lost. This shows that there is great potential for reducing the consumption of materialized labor. This also shows that we must actively encourage and develop the spirit of industriousness and thriftiness, practice careful calculations and strict budgeting, and tighten control over the consumption of materialized labor, so as to economize on it and eliminate its waste. Meanwhile, we must try by all means to adopt advanced technology, improve product designs, accelerate the renewal of the product generations, attach importance to quality control, increase products of high quality and decrease substandard or wasteful products. An increase of substandard or wasteful products will certainly lead to an increase in the consumption of materialized labor and waste of working hours, thus affecting economic results.

In order to improve economic results, it is necessary to attach great importance to market demands, make great efforts to improve product quality and increase the variety of goods which sell well. The production aim of our socialist enterprises is to satisfy the increasing demands of the people's material and cultural life. When estimating the economic results of enterprises, we should not only consider the output value of their production, but also how well their products meet social demands. If they consume materialized labor and actual labor but produce products of poor quality which sell poorly, a waste of labor and material resources will be bound to result, thus affecting the economic results. We found that this kind of waste was a common phenomenon in some enterprises. For example, a certain textile mill in Shashi, neglecting market demands, has blindly produced some chemical fiber products for which there is no demand, thus resulting in overstocking. Ostensibly, the output value of the factory had increased. But, as products were overstocked in the commercial department and did not sell well, the output value and economic results were all false. From now on, the stupid practice of doing things which earn us a name but bring us only trouble can never be repeated. Enterprises should be made to clearly understand the purpose of socialist production. Guidelines should be set for them in serving consumers, and they should do a good job in improving product quality and variety. Only in this way can the value and use value of products be in accord. And only thus can economic results be effectively improved.

CONSCIENTIOUSLY DO A GOOD JOB IN THE IMPORTANT TASK OF HANDLING LETTERS AND VISITS

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 37-38

[Short commentary]

[Text] Earnestly taking up the responsibility of doing a good job of handling people's letters and visits is an important task in maintaining close ties between the party and the masses. Protected by the constitution of the PRC and the party constitution, party members and the masses have the right and obligation, by means of letters and visits, to report on current conditions, to air grievances, to expose unlawful acts and violations of discipline and unhealthy tendencies in existence, and to criticize the various phases of work of the party and the government or to make recommendations thereon. In so doing, the masses of people demonstrate their full confidence in the party and the government. It is also one form of their participation in the political life of the party and of the nation and of their supervision over the various levels of leadership organs and their personnel. In the past few years, the various levels of leadership organs of the party and government and the relevant departments have paid increasing attention to this matter. They have done much work in this connection and have reaped good results. Nevertheless, several problems still exist which need to be thoroughly solved. Actual practice has shown that whether or not this important task has been well handled not only has a direct bearing on the political and economic rights and benefits of the parties concerned but also is closely related to the atmosphere of the whole party, the general mood of society, and the stability and unity of the whole society. We must really handle it as an important task and do a good job of it.

The focal point in doing a good job of this important task lies in the fact that the leadership cadres of the various party and government organs and the departments in charge of discipline and supervision and those handling letters and visits must embody a spirit of being highly responsible to the people. They must prevent and overcome the bureaucratic way of doing things and must earnestly take up the responsibility of grasping cases in a practicable manner. They must pay great attention to, and solemnly handle, all letters and visits, regardless of the parties concerned or the nature of the problems. First, they must not speak in a bureaucratic tone, must avoid the "yamen" air, but must treat the letters and visitors with sincerity. They must read carefully all the letters and patiently listen to what the visitors have to say. They must not show any annoyance if the visitors do not deliver their complaints in a coherent manner. As to those visitors who cannot control their temper, they must patiently console them and must not grumble at their bad attitude. Second, we must avoid arrears or procrastination in work, and must handle all cases promptly. All past arrears of work must be cleared off. As for problems that have newly arisen, we must promptly analyze and study them and take necessary measures on each and every one of them with due reference to the different circumstances involved and also in the order of their importance or urgency. We must not delay in making a decision. Concerning cases within one's own area of duties, the responsibility is assigned to the individual and a time limit must be set for their resolution. As for cases requiring instructions from above, instructions must be sought promptly, and must be put in effect as soon as they are received. Cases which should be referred to a subordinate organ to be handled should be so referred promptly and we should follow up by timely checking the progress of work and if it is not yet done, then the responsibility for the delay must be duly investigated. Third, do not dodge or make any excuses, or try to shift a problem to somewhere else. We must solidly and really solve a problem. In the case of a miscarriage of justice, the unjust verdict must be reversed, regardless of who originally handled it or who approved it. If policies are still found not yet implemented, they should be thoroughly implemented. Dodging and evading is tantamount to being irresponsible. A bureaucratic way of doing things which must be conquered is the taking of an irresponsible attitude toward the subject matter of complaints, or exposures, or charges and shifting the cases to subordinate organs, possibly eventually ending up at the culprit organs concerned. Frequent shifts of responsibility mean that the case has not yet been resolved. In fact, the case may become complicated and may result in more attacks and retaliation. As for really questionable comrades, they should be dealt with within the policy limits. In the event that an immediate solution is not possible, the actual circumstances must be explained to the party organ concerned to obtain their sympathetic understanding. Some visitors may make excessive or inappropriate demands. If this occurs, we must do some patient ideological and political processing work, and firmly insist that their problems be handled in accordance with party policies. Some letters and visitors may present views which are critical or constructive. They must be warmly encouraged, and their views must be promptly reported to the higher levels and forwarded to the relevant departments for further study. Due replies must be made. We must not be noncommittal or fail to give any reply. Actual practice has shown that in those localities which have carried out fairly well all the three points mentioned above, the number of letters and visitors making complaints has been continuously diminishing and the cases of bypassing the immediate leadership to present the problems to higher levels have steadily decreased. Conversely, in localities which have an accumulation of unresolved cases, the hidden contradictions have multiplied. Thus, it can be seen that overcoming the bureaucratic way of doing things and promoting the spirit of responsibility have an important bearing on the work of handling letters and visits.

Quite a number of the conditions and problems reflected in the people's letters and visits have been related to the unhealthy tendencies of unlawfulness and breach of party discipline inside the party and among the cadres. The various leadership organs of the party and government and the departments handling discipline inspection, or letters or visits, or legal affairs must thoroughly investigate problems of this kind. Each and every case must be closely scrutinized. Regardless of the number of cases pending, they must all be investigated. We should not consider this as too bothersome and should not be frightened by the large number of problems or by the fact that many cases cannot be easily dealt with. Whichever party committee is in charge must rigidly be made to take charge. The cases should not be turned over to ordinary or basic-level workers, since this may cause the cases to drag on and remain unresolved. We must determinedly protect the dignity of party discipline and national law. Inside the party and among the people we must truly carry out the principle that everybody is equal before the party and law. What must be done should be done. To be able to do this, we must be unselfish and fearless. First, we should not act wrongly or out of personal considerations or plead for others. We should not turn big problems into small problems and small problems into no problem at all. Second, we should not be afraid of retaliation or "give somebody tight shoes to wear" (make things hard for somebody by abusing our power). Whoever commits a crime must be prosecuted. The more important the cadres are who have violated party discipline and the national law, the more courageously should the higher-level party committee conduct itself in criticizing, stopping and even prosecuting the offenders. We shall never allow anybody to become unbridled or to have his own way even though he may have rendered past services to the state. Only in so doing can the party instill healthy tendencies and can we follow the wishes of the people and maintain the good reputation of the party and the government among the masses of people.

In confronting the current conditions and problems concerning the work of handling letters and visits, we should take the effective measure of "grasping the two ends and guiding the middle part." One end is to press for the resolution of problems which have been left pending. Some units or cadres have persisted in leaving cases unresolved even though they have substantial evidence on hand and these cases really deserve a reversal of their original verdicts in accordance with government policy. Some even went so far as to destroy evidence of bribery, prepare false evidence and lie. Some units or cadres have refused to investigate cases involving violations of discipline or law-breaking and impeded in various ways the necessary investigation and prosecution work. They even attacked or retaliated against the complainants or those reporting crimes. Why have they left these cases unresolved? This may be accounted for by two possible reasons. One is bureaucratism and lacking concern for the sufferings of the masses. The other is that the cases or problems exposed by the masses are directly or indirectly related to those in charge. To stop such practices, the high-level leadership organs must make a thorough investigation. They should solemnly deal with these cases and should take necessary measures, legal or otherwise, against offenders until they have been removed from their posts or duly punished. The other end relates to the problem of handling those visitors who have unreasonably created scenes and are generally incorrigible. Stern measures should be taken against such people. They should be subjected to labor reform, not to be released until they have fully repented and have given reassurances that they will not commit any more offenses. As a matter of fact, people of this category constitute the minority of the visitors, with the exception of those who have really suffered injustice or have some concrete and unresolved problems and must persist in making visits. In handling this category of persons, we must seriously appraise the actual circumstances and should refrain from deliberately enlarging the scope. We must sternly deal with those found to have taken the opportunity to falsely accuse or to attack other people to seek revenge. If we can firmly grasp the work along these two ends and at the same time pay sufficient attention to motivating other work in connection with letters and visits, then within a short period of time it will be possible to achieve noticeable results. We shall then be able to greatly promote the improvement of the tendencies and atmosphere of the party and society and also promote the stability and unity of the whole society. The various levels of party and government leadership organs should pay great attention to this important task which is beneficial to the party and to the people's interests, and should never regard it lightly.

BOWING ONE'S HEAD AND GIVING WAY TO OTHERS

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 39-40

[Ideological commentary by Lin Wenshan [2651 2429 1472]]

[Text] Good news spread on New Year's Day: At the forum on Comrade Chen Yun's article--"Tell the Truth, Do Not Save Face"--which had just been published, some old comrades who had been struggling for the revolutionary cause for several decades made some very sincere remarks. In brief, they urged us not to tolerate violations of the law and breaches of discipline, and not to give way to evil practices.

At the end of the 1950's, our party courageously mobilized the Chinese people to start a discussion on how China could open up a path for industrialization on its own. A stirring slogan was raised during this discussion--"make the mountains bow their heads and the rivers give way." Due to the mistakes in guiding ideology, this discussion did not score good results as expected but brought about the severe failure of the "Great Leap Forward." For this reason, the above slogan seemed to have become the synonym for boasting. In fact, to make the mountains bow their heads and the rivers give way is not an impossibility. During the 32 years since the founding of the PRC, we built railways such as the Baoji-Chengdu line, the Chengdu-Kunming line, the Xiangyang-Chongqing line and so on; we completed key large-scale water conservation projects such as the Liujiazia project, the Longyangxia project, Gezhouba Dam and so on; we also erected the Xiamen dike. None of these could be accomplished without removing mountains, damming rivers and reclaiming land from the seas. Examples like these are innumerable. The key is that we have to follow the objective law in things while getting rid of subjectivism. Therefore, the proletariat's indomitable boldness of vision which is reflected in the slogan should never be negated. Truth is on the proletariat's side, and our cause is a just one which is bound to win. All the forces which obstruct history from moving ahead will be forced to surrender and give way to the revolutionaries.

One of the consequences which the 10 years of turbulence brought to us is the large number of problems which constitute obstacles before us like "mountains" and "rivers." Offenses against the law and discipline can be considered as a mountain and evil practices as a river. This mountain severs our flesh-and-blood ties with the masses of people and prevents us from advancing, while that river may run rampant and flood the results which we have scored. Irremediable losses for the state and the people will be caused if we just let such a "mountain" and "river" remain. Whether this mountain bows its head or we bow ours, whether this river gives way to us or we give way to it, this problem is certainly a matter of life and death to our party and our country.

For the proletariat, there is but one answer: Never bow your heads to offenses against the law and discipline, and never give way to evil practices. Fortunately, there is one thing we can be gratified about: Quite a few advanced units and advanced individuals who resolutely fight against evil trends are emerging under the leadership of the CCP Central Committee. The Ministry of Coal Industry is a good example.

A kind of "flowing backward" has been prevalent in the Ministry of Coal Industry. Some children and relatives of cadres on the coal industrial front refused to work in coal pits as excavators and tried to get transferred from coal pits to offices. This was an unhealthy trend. So, the leading comrades of the Ministry of Coal Industry made up their minds to uphold principles, and redress without wavering the wrong tendency of "flowing backward." They laid down strict requirements, took effective measures and carried out conscientious examinations. They courageously criticized those cadres who did not do their best in implementing the regulations. They even went as far as to criticize them by name in newspapers. They bravely handled cases of those illegally transferred personnel, and even dismissed those who refused to return to coal pits and prohibited all coal industrial enterprises from reemploying them. Such boldness of vision which the leading comrades of the Ministry of Coal Industry showed in refusing to surrender and give way to the practice of "flowing backward" was really great. It can serve as a good example for the redressing of party work style. Being soft on a specific problem, "giving wrongdoers a way out," and letting those who are doing evil take advantage without being punished will only encourage offenders of the law and discipline, give the green light to evil practices and thus reduce the redressing of party work style to empty words.

Both offenses against law and discipline and evil practices can spoil social customs and thus hurt the party, the country and the people. Those persons who do shameful things like these are not up to the basic moral standards for a citizen, not to mention the qualifications for CCP membership. Every person with normal intelligence can clearly see the fact that offenses against law and discipline and evil practices go against the will of the party and the people, that they are adverse currents, nonessentials and undercurrents. The vast number of cadres and masses have long been very disgusted with such phenomena. Now that these phenomena constitute obstacles before us like "mountains" and "rivers," our party Central Committee has made the decision to completely check and thoroughly eliminate them. Both the people's will and the party's determination show us that no offense against the law and discipline and evil practices can be allowed to exist on the land of our great socialist PRC. We must live up to our word and should never stop until our goal is reached. This calls for an integration of leaders and the masses, and the mobilization of the whole people. First of all, those who are undertaking leading posts should take the lead in observing law and discipline and should never surrender and give way to the unhealthy tendencies existing in their own minds; those who have committed errors should take the lead in carrying out self-criticism and redressing mistakes. We call this bowing our heads to truth. At the same time, we must give strong support to those cadres and masses who resolutely struggle against unhealthy trends. We call this giving way to able and virtuous people who are on the side of truth.

Bowing our heads to truth and giving way to able and virtuous people also embody the great boldness of vision of the proletariat who keep to the direction of historical development. Such a boldness is needed in the struggle against the unhealthy trends as well as in other work. The leading comrades of the Ministry of Coal Industry have done well in these fields too. Faced with the poor fulfillment of the coal production task, Comrade Gao Yangwen, minister of coal industry, carried out a self-criticism at a meeting and then made a self-examination over radio and in newspapers before the people of the whole country, admitting that the main reason for the poor fulfillment lay in inefficient leadership and low morale. He took no account of his personal prestige and did not worry that "making self-criticism would make him lose face." So, he surrendered to truth and took the lead in resuming our party's fine tradition of self-criticism. After that, six old comrades in the Ministry of Coal Industry resigned on their own as vice ministers and retreated to the second line so as to give way to able and virtuous persons--to allow those comrades in their prime of life to give a better play to their abilities. In acting in this way, the leading comrades of the Ministry of Coal Industry have set examples for all of us. Then why should we doubt the possibility of a successful redressing of party work style since our comrades are armed with such a proletarian boldness of vision?

In the last few years, under the leadership of the CCP Central Committee, the party's work style has been improved and its prestige among the masses of the people has been upgraded. It is wrong to ignore this fact. Now, the problem is how to strive for a fundamental favorable turn for the better in the party's work style. And the key is to emulate the Ministry of Coal Industry; never bow our heads to offenses against the law and discipline and never give way to evil practices; but bow our heads to truth and give way to able and virtuous persons.

SCIENTISTS DISCUSS SYNTHESIZING OF T-RNA

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 41-44

> [Text] Editor's note: The research leading to the successful synthesizing of yeast alanine transfer-ribonucleic acid--T-RNA--is a major discovery and is as significant as the synthesizing of bovine insulin. This discovery was the result of the teamwork of the six units of the Shanghai Institute of Biochemistry, the Shanghai Institute of Cytobiology, the Shanghai Institute of Organic Chemistry, the Institute of Biophysics, all of which are under the auspices of the Chinese Academy of Sciences, and the biology department of Beijing University and the Shanghai No 2 Reagent Factory. This discovery has enabled us to take another step further in the long journey of exploring life sciences. All personnel participating in this research displayed the spirit of achieving rejuvenation through self-reliance, assiduously tackling key problems, coordinating and boldly scaling new heights. This is highly commendable.

Article by Wang Yinglai [3769 2019 4202]: "Fight in Unity and Tackle Problems Together"

Nucleic acid and protein are two of the most important macromolecular substances in the bodies of organisms. The former is the basic material of heredity and the latter stimulates various activities within organisms. Without these activities, there would be no life as we know it. Early in the mid-1950's, after the first protein--the chemical structure of bovine insulin (namely, the sequence of permutation of amino acid) was understood--people categorically asserted (see the British NATURE MAGAZINE 1955 issues) that although the chemical structure of the first protein was resolved, the possibility of synthesizing protein was a matter for the remote future. No more than 10 years after that assertion was made, Chinese scientists synthesized the first known chemically structured protein--bovine insulin--which shook the international scientific circles at that time. Now another biological macromolecular structure, that is, yeast alanine transfer-ribonucleic acid--T-RNA--has been synthesized first by Chinese scientists, thus enabling China to continue to be in the world's advanced ranks in the study of synthetic biological macromolecules. This is a matter which merits praise.

Being twice a group leader of the coordination group for synthesizing basic biological macromolecules, I deeply realize the importance and necessity of "fighting in coordination." Of course, the method of "fighting in coordination" should not be indiscriminately applied to every important subject of basic study. The adoption of this method depends on the nature of the research undertaken and the number of branches of learning included (that is, the different branches) and on the various stages of the research. In regard to many basic theoretical studies, large-scale coordination is not necessarily suitable and also not required, but as for the two tasks for synthesizing protein and ribonucleic acid, studying in coordination actually quickened the pace of fulfillment of the task and ensured the quality of the work through mutual tests and verification by different units.

We paid attention to fully encouraging democracy in our research work. At meetings of the coordination groups in Shanghai and Beijing, apart from hearing reports from the various subordinate units and discussing and studying the problems existing in the work, we arranged the tasks and division of work for the next stage of research. At these meetings, the representatives of the various units spoke freely. This indicated that the enthusiasm of the units participating in the coordination was fairly high. Before 1972, the plans for the synthesizing were mainly to adopt the method of chemical linking and of assigning responsibility by stages to the various units. However, no significant progress was made. At the same time, in the international arena there emerged a report relating to enzyme linking. In 1974, the Shanghai Institute of Biochemistry successfully used N1-RNA enzymes provided by the Institute of Biophysics to link two sections of 4 nucleotide-long into a section of 8 nucleotide-long. This was a heartening step in the combining of enzyme synthesis with chemical synthesis. At the end of 1975, at the Beijing-Shanghai coordination meeting, a plan was drawn up to directly link small sections with RNA synthetase and without using any patches. In 1976, 12 nucleotide-long and 16 nucleotide-long sections were linked successfully one after another, thus proving that the decision made at the 1975 Beijing coordination meeting was feasible.

Concentrating on crucial problems in the work and organizing great "key task" battles were important experiences in the success of this research work. At a meeting of the coordination groups held in Shanghai in March 1978, we discussed some crucial problems existing in the work at that time. In order to speed up the progress of the work, a decision was made to set up three battle groups: 1) the RNA synthetase battle group of which the Institute of Biophysics was in charge with the participation of personnel from the Shanghai Institute of Cytobiology and the Shanghai Institute of Biochemistry; 2) the activity determination research battle group of which the Shanghai Institute of Cytobiology was in charge with the participation of the Shanghai Institute of Biochemistry; and 3) the battle group of big-section binding and total synthesis of which the Institute of Biochemistry was in charge with the participation of the Shanghai Institute of Organic Chemistry, the Shanghai Institute of Cytobiology, the Institute of Biophysics and the biology department of Beijing University. This decision to set up the three battle groups was very important and timely. It played a positive and promotive role in the later stages of the work. The 13 years of experience in coordinated study on the synthesizing of ribonucleic acid has helped us deeply realize that for scientific research work to develop at a rapid pace, it is necessary to have a political situation of stability and unity so that the research personnel can work contentedly; it is necessary to have a correct line in work, to get rid of the obstructions of "leftist" thinking and selfish departmentalism; and the concern and leadership of the party organizations at various levels is the guarantee that the various coordination units will fight in unity and will strengthen the confidence and resolve of the research personnel.

Article by Wang You [3076 3731]: "Knowledge That Knows No Bounds, an Achievement of the Times"

"To understand genuinely and thoroughly what life is, we must probe into all manifestations of life, from the most elementary to the most advanced."--Engels

After chemically synthesizing crystalline insulin, the Chinese scientific and technological personnel who were active in the field of the study of the basic materials of life were pondering what would be their next task. At a symposium on scientific research in basic theory which was presided over by Comrade Nie Rongzhen, then chairman of the National Defense Scientific and Technological Commission of the PLA, in the Jingxi guesthouse in Beijing in April 1967, some people proposed that ribonucleic acid chemistry should be put on the agenda as the next assault task since the synthesizing of insulin had been achieved. This proposal was accepted by the participating scientists and was supported by Comrade Nie Rongzhen. After deliberations and investigations, the Chinese Academy of Sciences formally assigned tasks to the research units concerned. The "synthetic yeast alanine T-RNA" was one of the important subjects of our country's scientific research. Over the past 13 years, the personnel of the institutes, university and factory taking part in this research project have coordinated in unity, assiduously and intensively studied, and eventually completed the synthesizing of the whole molecule of yeast alanine T-RNA in November 1981, thus enabling China to enter a new stage in the study of the basic materials of life. This was another important contribution following the synthesizing of insulin. Speaking as one of the participants in these two important research projects, we are very proud of our successes.

Ribonucleic acid, protein, polysaccharide and others are important basic materials of life. For nearly 30 years, ribonucleic acid has been one of the important research subjects in the field of natural sciences. Ribonucleic acid is composed of organic macromolecules in specific series and has a complicated structure. The way to synthesize it is different from the way used earlier to synthesize insulin. Insulin was synthesized totally by the organic chemical method. Owing to its much greater molecular weight, we had some difficulties in synthesizing ribonucleic acid by the organic chemical method. Therefore, we adopted the method of combining chemical synthesis with enzyme synthesis, that is, we first used an organic chemical method to synthesize small sections of oligopeptide and then used RNA synthetase to link them up to form an entire molecule. The chemical synthesizing of enzymically synthesized ribonucleic acid was very difficult. Every step forward required strenuous efforts. The overwhelming majority of the comrades since their youth have been quietly doing hard and creative labor at their posts in a down-to-earth manner and are happily devoting precious years of their lives.

The synthesizing of ribonucleic acid demanded the close coordination of many branches of learning. For this reason, the successful synthesizing of T-RNA is the result of large-scale socialist coordination and the crystallization of collective labor and wisdom. The progress of the synthesizing of ribonucleic acid has also promoted the development of the branches of learning, such as biology and chemistry, which are related to the study specialty of ribonucleic acid. For instance, in the work of organic synthesis, a new technology was used and some laws of reaction were studied and summed up, thus enriching the contents of nucleic acid chemistry. We have also manufactured some medicines by utilizing nucleosides and nucleotides and striven to make contributions to the national economy and the people's livelihood while engaging in basic research. What is more important is that we have set up and developed a strong force which can shoulder the foundation, application and study of China's nucleic acid research.

As a task, the synthesizing of yeast alanine T-RNA has been completed. As for organic chemistry and the organic chemical personnel, they are even stronger as a result.

Zhuang Zi said: "A man's life is limited but knowledge knows no bounds." (Zhuang Zi: "Principles for Keeping in Good Health") Zhuang Zi realized the contradiction between limitations and boundlessness. However, he could not solve this contradiction. But 2,000 years later Engels pointed out the way to solve this contradiction: "On the one hand, the nature of man's thoughts will inevitably be regarded as absolute, and on the other hand, thoughts are realized by an individual who carries out the activity of thinking in a totally limited way. Only in the boundless process of advance and at least, as far as we are concerned, in the endless changes involving mankind, can this contradiction be solved." ("Selected Works of Marx and Engels," Vol 3, p 126)

Article by Wang Debao [3769 1795 1405]: "Work Together With One Heart and Boldly Scale the Heights"

The 13-year-long work of synthesizing yeast alanine T-RNA was successfully completed on 20 November last year. This was the result of the leadership of the CCP and the concerted efforts of all our comrades. As a group leader of a battle command group, I was naturally happy to see the complete success of this scientific research work. Concerning this work, I have a few words about my sketchy understanding:

1. Scientific research work requires a political situation of stability and unity and the guidance of a correct line. During the first 8 years, this

work progressed very slowly. This was the result of the lack of proficiency in terms of professional work on the one hand and, what is more important, the result of the obstructions and sabotage of the Lin Biao and Jiang Qing counterrevolutionary cliques on the other hand. Almost 6 years passed before an 8-section long nucleotide was synthesized. After the smashing of the "gang of four," and especially since the 3d Plenary Session of the 11th CCP Central Committee, we have emancipated our minds and sought truth from facts, thus resulting in the smooth progress of the work. The transmission of the spirit of the 6th Plenary Session of the 11th CCP Central Committee boosted the morale of all comrades. On 19 August, we formally entered the final "sprint." In September, we synthesized a 5'-terminal half-molecule (which was 35 nucleotides long), and on 20 November, we synthesized a whole molecule and determined its activity.

2. The battle groups laid stress from beginning to end on coordinating in unity, respecting, learning from and supporting one another. The members of the battle groups came from five units, 17 comrades in all. During the 3 and 1/2 years of battle, everyone worked with one heart and one mind and made a unified effort. As a group leader, I had all the more to be practical and realistic, fair and reasonable, cool-headed and sober, good at making judgments and being strict with myself, to set an example and share the joys and sorrows with the other comrades. At a time when the work was reaching its climax, whether it was a holiday or Sunday, day or night, I always fought alongside my comrades.

3. Stress was put on encouraging democracy on academic matters so as to draw on collective wisdom and absorb useful ideas. In the scientific research work, we paid attention to encouraging democracy on academic matters and, when discussing the plans, means and methods for the synthesizing, everyone was allowed to air his views and speak out freely. But once deliberations and studies had been carried out, a bold decision was made. Endless discussions were not encouraged so as to avoid bungling the opportunity of doing things in good time. For example, when we succeeded in synthesizing the synthetic 5'-terminal half-molecule and the natural 3'-terminal, and the natural 5'-terminal half-molecule and the synthetic 3'-terminal half-molecule, some people held that the time was not ripe to carry out the complete synthesis and that we should wait. We did some patient arguing and reasoning, and on the basis of a unified understanding, we made immediate plans for carrying out the complete synthesis, thus achieving the first success.

4. It was necessary to have the spirit of working with perseverance and persistence. Because the work was extremely difficult and strenuous and conditions were poor, coupled with the influence of "leftist" ideology which had run rampant for years, our progress was slow. This gave rise to battle fatigue among some of the personnel, who wished for an early discontinuation of the work. In 1977, at a meeting of the coordination group, we made a careful analysis and held full discussions with a definite objective in mind and pointed out that if we continued the battle, we would make achievements and win glory for the motherland, but if we abandoned it halfway, all the work we had done would have been for nothing. Through ideological and political work, people's morale was stabilized, confidence was strengthened and the smooth development of the research work was guaranteed.

5. Attention was paid to using foreign experiences as reference materials in striving to blaze new trails. In the course of the work, we found that RNA synthetase had been discovered abroad and we were enlightened therefrom, but we also found that there were some shortcomings in this work which lacked practical value. Through analyses and deliberations, we put forth the total plan for using chemical method or chemical plus enzymically synthetic method to synthesize small sections, then using RNA synthetase to link many small sections into six big sections, and then linking the big sections into two half-molecules and finally synthesizing a whole molecule. Practice since the establishment of the big section battle group in July 1978 proved that this plan was effective.

Article by Chen Shen [7115 1957]: "A Paen for Large-Scale Socialist Coordination"

The synthesizing of yeast alanine T-RNA was a 13-year journey full of hardships and difficulties as well as struggles. It was the embodiment of the spirit of collectivism in scientific research work and stands as a moving paen for large-scale socialist coordination.

The synthesizing of yeast alanine T-RNA is an important subject in the field of basic research. This work was characterized by comprehensiveness, extreme difficulty and considerable complexity, and therefore demanded the concerted efforts of many branches of learning. Many comrades of the Institute of Biophysics, with the overall interests in mind, abandoned their original jobs and joined the fighting collective.

"Win glory for the socialist motherland!" This is the common long-cherished wish of all personnel of our coordination group. It has been our motive force to work together with one heart and to scale the heights of science. The task of our institute was to supply sections and prepare tool enzymes and to fracture and link T-RNA molecules; 60 to 70 persons took part in this work in succession. Over 13 years, regardless of personnel changes, they proceeded from the overall interests, supported one another and did their bit to help synthesize yeast alanine T-RNA. Our institute manufactured 10 kinds of tool enzymes, such as N1-RNA enzyme made up of several hundred thousand units, and sent more than 10 persons to join in the work in Shanghai one after another. Some of our comrades, owing to the requirements of the research work, had to explore a different phase of the work shortly after they became familiar with one aspect of their work. For instance, after joining our group, some comrades successively took part in the work of various fields, such as microbiology, the synthesizing of sections and the preparation of multifarious tool enzymes. They underwent frequent changes in work. Nevertheless, they happily accepted and fulfilled their assigned work with all their might.

Full cooperation between different units is an important aspect of giving full play to the spirit of collectivism. In 1974, we prepared N1-RNA enzymes and sent them on our own initiative to various coordination units for further use. At that time, the Shanghai Institute of Biochemistry used them to synthesize a section of 7 phosphoric acid of 8 nucleotides-long. The enzymes we prepared played a proper role in the large-scale coordination. In 1978, when the coordination group was discussing work arrangements, T4-RNA synthetase became a barrier to the progress of the work. Failure to solve this problem in good time would affect the progress of the research work. Through discussions and studies, a decision was made to set up a battle group to tackle this key problem. In view of the conditions at that time, no matter which group singly undertook this task, it met with great difficulties. Knowing very well we would be beset with difficulties, our institute still undertook this battle task in order to solve the problem of synthetase as soon as possible. We sent specially assigned persons to turn over to the newly appointed unit without reserve the work of "determining the activity of T-RNA" which our institute had originally undertook, together with materials and data we had obtained. Recently, Comrade Lu Jiaxi, chairman of the Chinese Academy of Sciences, pointed out: "The full cooperation between different units, supporting one another in unity and learning from others' strong points to offset one's own weaknesses, was an important guarantee for this victory." In my opinion, his remark expressed the common understanding of the comrades taking part in this work.

Although we have synthesized T-RNA, we must, on the basis of summing up the experiences gained in this research work, continue to develop the spirit of large-scale socialist coordination and make new contributions to fulfilling the task of "tackling key problems in science and technology by pooling our efforts and strengthening our cooperation," a task set by Comrade Zhao Ziyang, and to realizing China's four modernizations.

'STAGFLATION'--A NEW CHRONIC DISEASE IN THE IMPERIALIST ECONOMY

Beijing RED FLAG in Chinese No 4, 16 Feb 82 pp 45-48

[Article by Guan Mengjue [7070 1125 6030]]

[Text] The Imperialist Economy Is Sinking Into the Mire of "Stagflation"

The "stagflation" of the imperialist economy is a new phenomenon, which only appeared at the end of the 1960's and early 1970's. In particular, the economic crisis of the capitalist world in 1974-1975 greatly accelerated "stagflation." It had two particular symptoms: On the one hand, the growth of the economy became stagnant and production slowed down, as a result of which unemployment increased substantially. On the other hand, serious currency inflation dragged on for a prolonged period, which brought in its wake a continuous rise in commodity prices. These two maladies blended with each other. Sometimes they would erupt together and at other times subside and emerge alternately. A vicious cycle was thus created and the imperialist economy was struck by a new incurable disease.

"Stagflation" is neither a replacement of the capitalist economic cycle nor is it one of the stages of this cycle. Rather, it coexists with the cycle and permeates its various stages. Before World War II, in the crisis stage and the depression stage of the economic cycle, the decline in production was usually accompanied by currency inflation and a fall in commodity prices. But, commencing with the crisis in the years 1957-1958, and particularly in the late 1960's and early 1970's, even in the crisis stage, what was jointly associated with the decline in production was a rise in commodity prices of the nature of a currency inflation. At the present juncture, "stagflation" has become a deep-rooted and a new special feature of the imperialist economy.

Below we cite some simple reference materials on how the imperialist economy is trapped in the quagmire of "stagflation."

1. Economic Stagnation

According to statistics compiled by the United Nations, the average growth rate of the value of the gross national product, computed on the basis of 1977 prices, of the developed capitalist countries (including the United States, Canada, West European countries, Japan, Australia and New Zealand) was as follows: 1961-1973, 5 percent; 1974-1979, a drop to 2.7 percent and in 1980 a further drop to 1.5 percent. In 1980, an economic crisis of overproduction developed in the United States, Britain and Canada. In comparison with the preceding year, the value of their gross national product, after eliminating the factors owing to currency inflation, showed the following changes: in the United States, a drop of 0.2 percent; in Canada, an increase of 0.1 percent; in Britain, a drop of 1.8 percent; and in West Germany and France, increases respectively of 1.8 percent and 1.3 percent.

2. Increased Unemployment and a High Unemployment Rate Prevailing at Every Stage of the Cycle

Before World War II and immediately afterward, the general situation in the imperialist countries was as follows: at the crisis stage of the economic cycle, a sharp increase in unemployment and a rise in the unemployment rate; while at the upsurge stage, the number of unemployed people fell and the unemployment rate went down. After the crisis in 1974-1975, the situation changed abruptly: huge unemployed ranks and a persistently high unemployment rate were found in every stage of the economic cycle. For example, in the United States, in 1974, the number of unemployed was 5.076 million and the unemployment rate was 5.6 percent; in 1975, at the lowest point of the crisis, the number of unemployed was 7.83 million and the unemployment rate was 8.5 percent. After the crisis, the unemployment rate, though falling, still remained at a high level: in 1976, the number of unemployed people was 7.288 million and the unemployment rate was 7.7 percent; in 1979, the number of unemployed people was 5.963 million but the unemployment rate was 5.8 percent, which was still higher than in 1974. In 1980, a new crisis developed in the United States. The number of unemployed increased to 7.448 million and the unemployment rate rose to 7.1 percent. In December 1981, the unemployment rate rose further to 8.8 percent and the number of unemployed went up to 9.6 million. In the nations of the European Economic Community, the unemployment rate in the first half of the 1960's was 1.5 percent on average, but there was a general rise after the 1970's. In 1979, it reached 5.6 percent and the number of unemployed was 9.4 million.

3. Intensification of Currency Inflation and a Rapid Rise in Commodity Prices

In the 1970's, currency inflation in the developed capitalist countries was much more intense than in the 1960's. Because these countries had to resort to issuing currency far in excess of normal circulation needs in an effort to make up for their fiscal deficits, coupled with other factors such as the continuous expansion of credits for both public and private use, an increasingly serious currency inflation emerged. Meanwhile, the combination of currency inflation with other factors brought about a general and rapid rise in commodity prices. From 1961 to 1970, in the developed capitalist countries, the prices of consumer goods averaged an annual increase of 3.5 percent, while from 1971 to 1978 the average annual increase was 8 percent and in 1979 the increase was 9 percent. In 1980, in the nine European Economic Community nations, the average rise in the prices of consumer goods was 13.9 percent and in the United States the rise was 12.6 percent.

The Real Nature and Causes of "Stagflation"

Everybody knows that the basic contradiction in capitalism is the contradiction between the continuous development of the socialization of production and the form of ownership under capitalism. The concrete manifestation of this contradiction is seen in many aspects. Of them, an important one is the contradiction between the continuous expansion of production and the relative decrease in consumer demand backed by the ability to pay on the part of the masses; in other words, the contradiction between a production surplus and a narrowing market. In the past, when state monopoly capitalism had not yet reached its dominant and ruling position, this contradiction was forcefully and temporarily removed as the result of a relative state of equilibrium being reached between production and effective demand. This was brought about by means of cyclical economic crises of surplus production, which greatly damaged the productive forces and the products of labor. After World War II, for a prolonged period of time the developed capitalist countries adopted the anticrisis policies of Keynesianism, particularly the inflation policy in finance and currency, and stepped up state intervention in the economy. As a result, on the one hand, this meant that each crisis was consequently unable to fully develop and this made it difficult to reach a temporary solution of the contradiction between an excessive surplus in production coupled with a corresponding narrowing of the market. In turn, this caused a continuous accumulation and aggravation of the contradiction. On the other hand, the development of currency inflation was further promoted. From this it can be seen that "stagflation" represents a new and special manifestation of capitalism's basic contradiction in the field of economics. It is also a concentrated manifestation of the decaying nature of capitalism.

From the real nature of "stagflation," we can clearly see the following: The basic cause for its emergence is the development changes in the basic contradiction of capitalism. The secondary cause for its continuous development is the adoption of the policy of Keynesianism in an effort to pacify the basic contradiction. This is not to say that the policy is not an important one. In reality, it has played an important role in promoting "stagflation." However, in the final analysis, the policy of Keynesianism was forced into being by the basic contradiction of capitalism. So long as the basic contradiction of capitalism continues to exist and to move forward, the problem of "stagflation" cannot be solved, no matter whether the economic policy adopted is one based on the theories of the currency school or on the theories of the supply-side school.

If it is claimed that the basic contradiction of capitalism is the original cause of "stagflation," it may then be asked why, since the basic contradiction of capitalism has been in existence for a long time, didn't "stagflation" appear until the end of the 1960's and the early 1970's? This is because before the end of the 1960's, a host of postwar circumstances, particularly the fact that the third scientific and technological revolution was in progress and the renewal of fixed assets was coming to a head, helped to foster the comparatively rapid growth of the capitalist economy. The basic contradiction of capitalism, including the contradiction between expanding production and the relative narrowing of the market, was kept in check by the anticrisis measures taken. Moreover, owing to the operation of various factors both inside a country and abroad, "stagflation" was prevented from making a widespread development. By the end of the 1960's and after the early 1970's, particularly following the economic crisis in 1974-1975, the basic contradiction eventually got out of control and "stagflation" appeared in full force. Below we will discuss the two aspects of this problem.

One aspect of the problem was that after the war the policy of the capitalist countries of depending on state monopoly capitalism to keep in check the basic contradiction and to stimulate the growth of the economy actually had the opposite effect. Because of the relative narrowness of the market and the surplus production power of the countries, the various policies and measures adopted by the countries to protect their expanded investments began to produce diminishing effects. During the period from 1974 to 1979, in the United States, West Germany, France and Italy, the utilization of production capacity was below 90 percent, sometimes as low as 70 percent. Under the conditions of a surplus production capacity, whatever measures were adopted by the governments to encourage investment could not keep investments in fixed assets from falling into a state of stagnation. As a result, labor productivity declined and economic growth slumped. At the same time, the financial and credit measures adopted by the state to expand the market not only had diminishing effects but also brought about serious deficit economies. For example, in 1978, the per capita debt burden of the American people was 24.9 percent of the individual income. In other words, a fourth of their purchasing power had been expended in advance. By October 1981, the national debt of the United States had already passed the $1 trillion mark. In addition, the mortgages on the American people's houses amounted to $1.1 trillion and consumer loans taken out to be repaid in installments (not including mortgages on houses) amounted to $309 billion, while loans owed to commercial banks by consumers and industrial circles amounted to $174 billion. The above three items totaled $1.585 trillion. This, plus the amount of the national debt, added up to a grand total in excess of $2.583 trillion. Such a massive amount of public and private indebtedness not only intensified currency inflation but also seriously curtailed the purchasing power of the American people and reduced their demands backed by the ability to pay. While the enormous amount of military expenditures could for a time create a market, with the passage of time their stimulatory effect will be gradually weakened and will begin to produce adverse effects and become negative factors impeding economic growth and reducing civil production. Moreover, the people's burden will be increased, while the market for products for civil use will be reduced.

The other aspect of the problem is that since the last stage of the 1960's, the developed capitalist countries have been steadily carrying out the Keynesian policy of deficit financing and credit expansion. As a result, the supply of currency and bank credits has rapidly increased and currency inflation has been intensified. All this constitutes the main cause for the rise in commodity prices.

Some capitalist economists are inclined to ascribe the cause of "stagflation" to the rise in salaries. They advocate the so-called "wage propulsion theory." For example, some people wrote: "The arresting of the downward trend of wages and commodity prices and the enforced rise of wages and commodity prices brought about by trade unions and other powerful circles with the instigation and help of governments are the basic causes of 'stagflation.'" ((Habailei): "Modern Economic Problems," p 316) They closed their eyes to the fact that in the course of serious currency inflation, the rise of commodity prices occurs first and is then followed by a nominal rise in wages and that actually in recent years real wages have been on the downturn. And they ascribe the basic cause of "stagflation" to the rise in wages! Is this not a naked absurdity of speaking on behalf of the monopoly capitalist class and an attack on the working class?

Effect of "Stagflation" on the Economic Cycle

As mentioned above, "stagflation" does not denote the phenomenon of a certain stage of the economic cycle; it permeates the various stages of the cycle and brings about an enormous change in its whole pattern. In the crisis stage, production declines, unemployment increases and these two things combine with currency inflation. In turn, currency inflation brings about a rise in commodity prices, weakens the purchasing power of the masses, impedes economic recovery and makes it difficult for the economy to extricate itself from the crisis. This condition is called by Western economists "inflation-recession," that is to say, economic recession accompanied by currency inflation. At the depression and recovery stages of the cycle, the feeble recuperative power is accompanied by currency inflation and the slackening of fixed capital investments. The recovery of the economy is slow and unsure and there still remains a large number of unemployed people and a high unemployment rate. This the Western economists call "growth-recession," that is, the persistence of recession factors in the course of economic growth. This might be described as growth in a sickly state and growth which is entangled with currency inflation. In the upsurge stage of the cycle, feeble economic growth is combined with currency inflation of a more violent character which renders the upsurge stage short and untenable. The Western economists call this "depressed inflation," that is, the persistence of recession factors in the upsurge stage, or, a feeble upsurge under the high pressure of currency inflation. The reasons for these changes in the various stages of the economic cycle are as follows: 1) Currency inflation permeates the various stages of the cycle ranging from the crisis stage to the upsurge stage. This serves as an important factor which prolongs the crisis and hinders the recovery and upsurge stages. 2) Permeation of stagflation in the course of the cyclical movements owing to such factors as the feeble state of fixed capital investments, a relatively narrow market, and a large number of unemployed people.

Pincered by Stagnation and Inflation, the Western Economy Will Find It Hard To Escape From Its Difficult Situation

At present, the governments of the developed capitalist countries are doing their utmost to find a way out of the difficult situation of "stagflation."

After taking over the reins of the government in May 1979, Mrs Thatcher of Britain was the first to adopt the economic strategem of monetarism. Emphasis was put on restricting the issue of currency and on reducing government expenditures in order to keep currency inflation under control. Since its assumption of power, the Reagan administration of the United States has carried out an economy policy based on the theories of the supply-side school and the currency school but with the theories of the former taking the lead. These are as follows: reduced taxation for corporations and rich people in order to encourage investments and to increase production; control of the volume of currency issued and increases in interest rates to check currency inflation; reduction of government expenditures, principally social welfare expenditures; huge increases in the lone item of national defense expenditures; and cutting down of government's intervention in the economy and abolishment of certain rules and regulations so as to give private enterprises more freedom of action. The Mitterrand government of France adopted three new measures in the realm of economics: First, the former government considered checking currency inflation as the focal point of work but the focal point now is to tackle the unemployment problem. Second, the former government's policy of economic retrenchment has now been replaced by one of economic expansion. Third, the government is greatly promoting the nationalization of enterprises and strengthening government's intervention in economic life. In addition, certain Western European countries and Japan still insist on direct government intervention in economic affairs, such as the continued use of financial and currency tactics to regulate social demands and the economic activities of enterprises, the stepping up of planning work on various fronts, and so on.

Is it possible for the developed capitalist countries to use these policies and measures to cure the chronic disease of "stagflation"? We do not discount such a possibility. The government of a certain country, as the result of adopting a certain policy, might be able to ease or even reduce currency inflation for a given period and might succeed in shifting the situation of economic stagnation to another period. However, it is extremely difficult to solve the two problems of stagnation and inflation at the same time. This is because, under the present conditions of the imperialist economy, stagnation and inflation check and restrain each other. In order to cure economic stagnation, it is necessary to adopt an inflation policy, including expanding government expenditures, issuing more currency, lowering the interest rate, expanding both private and public credits and loans, artificially enlarging the market, and so on. All this means that currency inflation will be intensified. On the other hand, in order to cure currency inflation, it is necessary to adopt a retrenchment policy, including reducing government expenditure, reducing the volume of currency issued, raising the interest rate, restricting credits and loans, and so on. In this way, the money market will be tightened, investments will slacken and the market will shrink. All this, in turn, will intensify the economic stagnation and might even bring about an economic crisis. Precisely because of this, the governments of certain capitalist countries have alternated between opposing currency inflation and opposing economic stagnation. They appear to be undecided whether to fight firmly against economic stagnation or to get rid of currency inflation. They waver from one side to the other and are in a dilemma. Indeed, in recent years, the economies of the developed capitalist countries have been entangled in a difficult situation with "stagnation" and "inflation" being interwoven together, erupting at the same time, and rising and falling after one another.

The basis of "stagflation" is economic stagnation. At present, certain developed capitalist countries such as the United States, Britain and others are taking currency inflation as their "archenemy." Finding themselves in a helpless situation, some people have advocated the use of economic recession to combat currency inflation, the so-called "fighting poison with poison." For example, the famous Austrian economist (Hayeke) believed that the only way to eliminate currency inflation was to make the economy go through a serious recession, or endure a not too extended period of economic depression. Suggestions of this kind show that, caught in the pincer movement of economic stagnation and currency inflation, the capitalist class really cannot find a way out. Assuming that recession really can eliminate currency inflation, then, conversely, this means that currency inflation can be used to overcome recession. Is this not like using your own spear to fight against your shield? Besides, the economic crises that occurred at the end of the 1960's and the beginning of the 1970's were different in character from those before World War II and those after the war. This is because this time, even in the crisis stage, commodity prices continued to rise and currency inflation was still rampant. This may be ascribed to the working of the so-called anticyclical movement of commodity prices. This being the case, how can we believe that resorting to economic recession can eliminate currency inflation?

Lenin said: Monopoly necessarily brings about the trend to stagnation and decay. "Stagflation" is the intensified version of the trend to stagnation and decay brought about by the superclass "monopoly" of state monopoly capitalism. Since state monopoly capitalism cannot cure the trend to stagnation and decay, which it promotes itself, naturally it cannot extricate itself from the difficult state of "stagflation."

ON 'DREDGING' AND 'BLOCKING'

Beijing RED FLAG in Chinese No 4, 16 Feb 82 inside back cover

[Article by Wang Shumin [3769 6615 3046]]

[Text] It should be affirmed that the principle of dredging must be carried out in ideological and political work. We must not, however, think that "dredging" and "blocking" should complement each other. We should take "dredging" as the main factor and make "blocking" subsidiary. In this way we can achieve the desired results.

The allusion to dredging comes from the story "Da Yu Harnesses the River." Learning a lesson from his father, who only "blocked" and had not "dredged," Da Yu led the people in dredging the river and making the river water flow into the sea. In the end the river was harnessed. Da Yu was loved and esteemed by the people. This story tells us that it is wrong just to "block" and not to "dredge" and also that it is not the best policy just to "dredge" and not to "block." We cannot really block if we only "block" and do not "dredge," and we cannot dredge well if we only "dredge" and do not "block." "Dredging" and "blocking" do not absolutely exclude each other. Dredging must include the necessary "blocking." This is the correct way to draw inspiration from the experience of Da Yu in harnessing the river.

The above method of harnessing a river can be used for reference in our current political life. At present, our country is at an historical juncture. People are lively in their thinking, and all kinds of erroneous ideas might manifest themselves. When some erroneous words and deeds are harmful to the interests of the party and people, we should adopt the principle of dredging, persist in persuasion, teach with skill and patience, and reason with words and action. We must not adopt a high-handed policy. When some people say or do something wrong, we must not capitalize on their mistakes or shortcomings, put labels on them, beat them or put their records on file. But by dredging, we do not mean that we should let erroneous things spread unchecked or that we should not adopt the practical method of "blocking." To those who have said or done something wrong, we must not only patiently carry out criticism and education, but also adopt necessary measures to prevent their mistakes from recurring and developing. We should deal with those who have violated party discipline, the law, or the correct rules and regulations in accordance with their different cases. This includes the idea of "blocking," which enables us to "dredge" better. The meaning of the saying "it will not flow if it is not blocked and it will not go if it is not stopped" is included in this truth.

Some comrades say that with regard to the enemy we can "block," but with regard to the people we must "dredge." What they say sounds rather reasonable, but if we think it over carefully, it is not so accurate. Of course, with regard to the erroneous words and deeds among the people, we must dredge, but this does not in the least mean that we should not "block." For instance, toward those who are opposed to the four basic principles, besides carrying out criticism and education and the necessary ideological struggle, we must adopt relevant measures. This is a kind of "blocking." Generally speaking, telling people what they should do is "dredging"; and telling people what not to do is "blocking." These two methods are often used among the people.

Is it right to say that we must only "block" the enemy and not "dredge"? No. When we put counterrevolutionaries and all kinds of criminals under arrest, we only allow them to be well-behaved and law-abiding. This is of course "blocking." But these persons have to be reformed so that they can become new persons. This excludes some who are guilty of the most heinous crimes, who must be given the death penalty. In this respect, we must do a great deal of educational work, make them understand our policies and point out the way. This is in the sphere of "dredging." Obviously, it is not accurate to understand one of the methods of "dredging" or "blocking" to be for handling the contradictions among the people and the other for handling the contradictions between the enemy and ourselves.

In the past, some comrades had a one-sided understanding of "dredging" and "blocking." Therefore, one-sidedness also appeared in the carrying out of policies. For instance, some units lost a great deal of public property. The principle of "dredging" was introduced, but to no avail. In some rural areas, some individuals gathered together and gambled secretly. The commune and brigade leaders had educated them many times, but in vain. As a result, there was "you 'dredge' yours, I'll gamble mine" and there was no prohibition. This tells us that we must correctly understand the principle of "dredging." We must not go from one extreme to another. We must bear this lesson in mind, conscientiously study Marxism-Leninism-Mao Zedong Thought, learn how to use materialist dialectics in observing and handling problems, correctly understand and implement the party's principles and policies, and do our work in a down-to-earth manner.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

UNIFY THINKING, CONSCIENTIOUSLY RECTIFY PARTY WORK STYLE

Beijing RED FLAG in Chinese No 5, 1 Mar 82 pp 2-13, 16

[Speech by Wang Renzhong on 11 February 1982 at a meeting of responsible cadres of departments directly under the Hubei provincial authorities]

[Text] Talking about the importance of the question concerning party work style, Comrade Chen Yun once said: "The question concerning the work style of a ruling party is a question concerning the life and death of this party." That is to say, the question of party work style concerns whether our party will degenerate and whether our country will change its political color. Comrade Mao Zedong made the mistake of launching the "Great Cultural Revolution" because he wrongly appraised the situation and thought that our party would soon degenerate and our country change its political color. His appraisal was incompatible with the actual conditions. His wrong appraisal of the situation led to the adoption of wrong policies and resulted in the decade-long internal strife. This was an impressive lesson. However, speaking in terms of possibility, there is the danger that the party may degenerate and the country change its political color. As long as imperialism and social imperialism exist and before we have achieved communism, we cannot say that the danger of the party degenerating and the country changing its political color does not exist. If we say that our party and country are not in such a danger, we are in danger of slackening our vigilance. The correct attitude is to be aware of this danger and adopt a correct method to overcome this danger. Only by doing so can we ensure that our party will not degenerate and our country will not change its political color. We have confidence in our ability to do so.

The First Question Is What Attitude We Should Take Toward Our Party Work Style

Our party work style has been appraised in two incorrect ways. One incorrect appraisal is made by a few people who hold that our party has degenerated, is hopeless and must be toppled and it is necessary to change the regime. They say that a two-party system should be adopted as in the United States and the two parties take the reins of government by turns, with one holding office and the other being out of office. This view is held by the remnant forces of the "gang of four," including Jiang Qing and Zhang Chunqiao who are in prison. Echoing them in society are the heads of some illegal organizations and publications. Their words and deeds are counterrevolutionary. We must expose and crack down on their words and deeds. There are other muddleheaded people, especially some youngsters, who believe these words and lose their confidence in the party. We should not label them as counterrevolutionaries but should warn them and educate them through criticism. We should tell them to neither be taken in by the enemy nor to echo the enemy's counterrevolutionary words. There were still quite a number of such muddleheaded people in the first half of last year. The conditions now have been greatly improved. But, we cannot say that there are no such people at present. We are still required to work on them.

The other incorrect appraisal is made by another small group of people who hold that there is nothing wrong with our party work style. In their opinion, people are trying to scare others when they say that our party work style is unhealthy; people are exaggerating when they say that the matter concerns the life and death of the party. Some comrades even hold that the practices of establishing underhand connections for the sake of personal gain, securing advantages through pull or influence, putting up houses for private use, transferring rural residences to cities and seeking privileges in daily life are trifles. They do not know that these trifles have caused the dissatisfaction of the masses with our party, harmed the image of our party and impaired the prestige of our party. Moreover, these trifles are not few but exist rather extensively. For example, the practice of putting up houses for private use is widely prevalent. Some cadres put up houses for private use by adopting various undesirable means, such as encroaching on vegetable plots, embezzling public funds or using manpower of the collective or the urban building construction teams. In some cases, very obnoxious practices have been involved. Some cadres have seized houses, and not just one but two or three in some instances. Some houses were intended to be built for workers but eventually became the leading cadres' quarters. The masses were certainly critical about this. The question of "changing agricultural population into nonagricultural population" also exists in many localities. Some people took not only their wives and children but also their relatives and friends to the cities to consume commodity grain and unlawfully arranged jobs for them. Why was it that urban population continued to grow? Many rural residents came to the cities through underhand means. The masses also were very critical about this. This shows that such phenomena are not minor problems in daily life but have posed a serious political problem. Quantitative change will lead to qualitative change when it develops to a certain extent. This is a basic principle of the Marxist dialectics.

What especially attracts our close attention is that in our party and army, in the state organs and in our enterprises and institutions, there are bad elements engaged in smuggling, bribery, profiteering, graft and embezzlement. Up to the present, we have not discovered any province free from these conditions. Of course, conditions vary in different localities and may be serious in one locality and not so serious in another. Smuggling is rampant to an appalling extent in some localities. These economic crimes were often committed by the higher levels working in collaboration with the lower levels, by people at home working in collaboration with those abroad, by people in the interior working in collaboration with those in Hong Kong and Taiwan and by capitalists at home working in collaboration with foreign capitalists. This is not only an economic problem but also a very serious political problem and reflects the class struggle at present. Some of those committing these crimes were recruited by special agents; they gave them information and joined their secret service. Our comrades must understand that as long as imperialism and social imperialism exist and before Taiwan has returned to the embrace of the motherland, they will always carry out espionage against us. Of course, we should not think that all foreigners, compatriots from Hong Kong and Taiwan and Overseas Chinese who visit our country are up to no good. But it is naive to say that none of these visitors is a special agent. Therefore, we must teach our comrades not to be taken in by them but to heighten their vigilance against them. Take for example the foreign capitalists who do business with us. Like any capitalists, they are intent on nothing but profit. Is there any capitalist in the world (except a few progressive ones) who does not want to make profit? That is the nature of a capitalist. Our open-door policy will not change. Neither shall we change our policy of making contacts and cultivating friendship with the peoples and governments of all foreign countries. However, our comrades must never forget that: First, in doing business with foreigners, we should do our best to avoid being taken in and at least to avoid suffering great losses. Second, we must pay particular attention to resisting the corrosive influence of the bourgeois ideology and way of life and always be vigilant against the bourgeoisie's attack with "sugar-coated bullets." We must see that we are now facing a struggle between corrosion and anticorrosion. With the increase in international communication, this struggle is becoming more and more complicated. For example, a capitalist may give you television sets and tape recorders. Does he give you these things for nothing? Is he so generous? A certain comrade borrowed money from a capitalist when he was abroad. Actually he was asking for money rather than borrowing money from others and when you sign contracts with them, you will have to agree to any terms set by them. By doing so, you have made a small profit, but the state suffers a great loss. Does such a man have an iota of patriotism, not to mention party spirit? Some other people have collaborated with foreign merchants in speculation and profiteering by recklessly smuggling gold, silver, cultural relics and rare herbal medicine. They deliberately broke the law. Their crimes cannot be pardoned.

The biggest criminals ever discovered in Guangdong are the director of the Guangzhou Telecommunication Bureau and his wife. Is he the person of the highest rank involved in similar cases? No one can guarantee that there are no other persons of still higher rank involved. The CCP Central Committee has now decided to make a thoroughgoing investigation. The higher the rank of a cadre handling the cases of graft and embezzlement, profiteering, smuggling and other economic crimes is, the more strictly he should handle these cases. Why? The first reason is that he has been long educated by the party and tempered in the revolution and therefore should have strong party spirit; he is experienced in handling such cases and is not young and naive so that he should handle the cases strictly. The second reason is that strict handling of cases involving a few leading cadres who seriously violated the law and discipline may create public opinion inside the party and in society that bureaucrats of the CCP should not shield each other and leading cadres should be severely punished for violating the law. This means love for our veteran cadres and defends their honor. The final results of the investigation will show that only a very small number of our veteran cadres have seriously violated the law and discipline. This will tell the masses that only a very small number of our veteran cadres have degenerated. This will preserve the prestige of our veteran cadres and our party. Otherwise, a small piece of rotten meat will spoil the whole pot of food. Facts have proved that the broad masses of our veteran cadres are good and maintain the fine traditions of the party and that only a very small number of them have degenerated. Some comrades have been tainted with bad habits and have made mistakes under new conditions. They are different from those who have degenerated. We believe that they will definitely change for the better after receiving education.

We must correctly appraise the question concerning party work style. On the one hand, we should see that our party work style has not fundamentally changed for the better; on the other, we should see that our party work style has undergone a considerably great change for the better in the past few years.

What are the chief indications which show that our party work style has changed for the better? First of all, we have a good party Central Committee. Our current Central Committee has really revived and carried forward our party's fine traditions and the work style of integrating theory with reality, maintaining close ties with the masses and making criticism and self-criticism. It realistically acts according to the principle of democratic centralism and no longer follows the practice of letting one person alone or a few people have the say. With the exception of some questions in daily work which the Central Secretariat is authorized by the Central Politburo to decide on and handle, the decisions made by the Central Secretariat on questions concerning major principles and policies must be approved by the Politburo or the Standing Committee of the Politburo prior to circulation as central instructions. The meetings of the Central Secretariat are usually presided over by Comrade Hu Yaobang. Comrade Zhao Ziyang also takes part in the discussion of important questions concerning government work and economic work. Naturally we respect the opinions of both Comrades Hu Yaobang and Zhao Ziyang. However, a decision is never made by an individual but is made only after group discussion. During these discussions, each comrade may give his own opinion and even those comrades who attend meetings of the Central Secretariat as observers may express their opinions. Should there be different opinions, the Secretariat adopts a cautious attitude and usually postpones the making of decisions. Whether during the meetings or personal talks, the comrades of the Secretariat including our secretary general, always seriously make criticisms and self-criticisms. The situation is the same in the Central Politburo. Once in a discussion of a very important question, a few comrades put forth different opinions which were later proved wrong in actual practice. However, none of these comrades was ordered to make self-criticism or held responsible for the mistake. In fact, all these comrades who gave different opinions are good comrades and they are concerned with the interests of our country without any selfish ideas and personal considerations. There will be no problem at all when they realize that their ideas are wrong and resolutely implement the party's decisions. Our current Central Committee really is developing democracy and is indeed exercising collective leadership according to the principles of democratic centralism.

Now the central authorities are taking the lead in streamlining organization, training cadres in rotation, raising efficiency and overcoming bureaucratism. This is a revolution in the state system which is of profound significance. Yet, instead of merely requiring organizations at lower levels to carry out this revolution, the central authorities are the first to do so by setting an example for the lower levels and undergoing experiences to be passed on to the lower levels.

Regarding the actions of senior cadres in their daily life, not one leading comrade in the central authorities has been found to have violated the relevant stipulations of the central authorities since they were made. In the past, each member at or above the level of the Politburo of the party Central Committee, vice premier and vice chairman of the NPC Standing Committee had two cars. It was then decided that each of them should have only one car, and this stipulation is now being observed. In the past, leading comrades in the central authorities had the privilege of having a film shown at their own place. This privilege has been given up in accordance with the criticisms of the masses. Now when we want to see a film we have to buy a ticket and see the film together with other comrades. All gifts received by leading comrades in the central authorities during their visits to other countries must be handed over to the state, except for souvenir badges. Now Zhongnanhai is open to the public on Saturdays and Sundays, and cadres and masses can buy tickets to visit it. The Great Hall of the People is also opened to the public, cadres and masses can buy tickets to visit it, and mass organizations and various associations can hold their meetings there. All this could not have happened in the past. Before the "Great Cultural Revolution," conferences were usually held every summer at Lushan or Beidaihe, so that central leaders could enjoy themselves at these summer resorts while attending conferences. This practice has also been changed. Not one leading comrade in the central authorities who is in good health takes off for a vacation, except those who are old or sick and are allowed by the central authorities to leave their posts for convalescence. Even on Sunday, they often do not rest but continue to work. This is the real life of the party Central Committee. However, some people are still attacking the party Central Committee, saying that they enjoy privileges. They have even said that the Central Committee has degenerated and deteriorated. What else can this be if it is not rumormongering?

What was mentioned above shows that our party Central Committee is good. It is not as bad as some people have said. We are reasonable to say that the work style of the present party Central Committee is even better than that before the "Great Cultural Revolution." The fine traditions during the Yanan period and the period of the liberation war as well as the fine traditions during the period immediately after the founding of the state have been carried on in the present party Central Committee. Of course, what is the most important is that a correct and Marxist ideological, political and organizational line which suits China's conditions has been mapped out since the 3d, 4th, 5th and 6th plenary sessions of the 11th CCP Central Committee. The "resolution" adopted by the sixth plenary session, in particular, summed up historical experiences of our party since the founding of the state and is playing an important role in bringing order out of chaos, in unifying the ideology of the whole party, in strengthening the unity of the whole party and in promoting our work. It is of great historical significance. Our practice over the past several years shows that the line, policies and principles formulated by the CCP Central Committee are correct. As to some mistakes and shortcomings in our concrete work, they are unavoidable at present and will also be unavoidable in the future; they were unavoidable when Comrade Mao Zedong was alive, and would also be unavoidable even if Marx were chairman of our party.

Soon after the sixth plenary session, a forum on work on the ideological front was held. It advocated carrying out criticism and self-criticism, strengthening party discipline and overcoming laxity and weakness. It not only criticized the trend of bourgeois liberalization but also required that CCP committees at all levels fight against various unhealthy tendencies on various fronts. Recently after making some investigations at the lower levels, I felt that this forum has really played a great role. Before I made the investigations I did not expect that the forum on the ideological front work had played such a great role and felt that many ideological problems were still not solved. But now I have realized that the role this forum has played is greater than I had expected. As everyone can see, over the past half year or so, we have made encouraging progress in our press, broadcast, television, film and other work. Recently I had a talk with some comrades from the literary and art circles. I found that they all have new plans and have made up their minds to go deep into the thick of life and create better literary works.

In Guangxi, Hunan and Hubei, when I called some advanced people together and had a talk with them, I found that within our party, there are still large numbers of good comrades who have high class consciousness, are honest and upright and dare to struggle against unhealthy tendencies and evil practices. In Hubei some veteran model workers of the 1950's whom I talked with are still keeping to their lofty fine qualities in ideology and in work style. Some of the advanced people are young people. For example, in Guangxi, there is a female comrade called Zeng Xiaolian. She is a league branch secretary and has a high consciousness and a good style of work. She has done very well in helping some backward or erring youths. Her mother is a neighborhood committee director, who has been serving the masses of people wholeheartedly for 30 years or so. There is no stealing in their residential district. You can just leave your bicycle in front of a gate, for thieves dare not steal things in this district. Both the mother and the daughter are advanced individuals. As soon as I learned this, I made a telephone call to Beijing, inviting two writers to come to Guangxi to write about the advanced people and their good deeds. The large number of good cadres and advanced people always act in accordance with the party Central Committee's requirements, and their hearts and the hearts of the people always beat as one. It is not as some people have said that, just as all crows are black, everyone is involved in the unhealthy practices. Definitely not! Although such advanced people are few, their exemplary role is very important. They represent the healthy trends of our party and our nation!

In Hubei, were not some female comrades labeled as the so-called "five black flowers" during the "Great Cultural Revolution"? I only wrote a short article in the past to praise "a red flower," that is, Comrade Xia Juhua. However, some people in the "rebellion faction" created the "five black flowers." They included not only Xia Juhua, but also Liu Feng, Chen Kuang, Jiang Guiying and Wang Yuzhen. This time I had a talk with some of them and some other outstanding young actors and actresses who have scored achievements in their artistic work. They are all loyal to the party and are ready to make more contributions to the party and the people before they become old. This is highly commendable. However, they feel there is insufficient scope to exercise their abilities and nobody will listen to them. Although Liu Feng is a girl of strong character, she cried bitterly this time when she spoke. I said, at the time when the party Central Committee is combating the unhealthy tendencies, you have answered the party's call enthusiastically and boldly struggled against the unhealthy tendencies. Thus you have played the role of a mainstay at the mid-levels. Thus, our party is full of promise. I also talked with some comrades from the press circles. After one of the editors of GUANGMING RIBAO finished her impassioned speech, I said, you must insist on fighting; what on earth are you afraid of? She said she was not afraid of anything but what she said would be of no use. What conclusion can we draw from this? It shows that we have many good comrades who wish to do more work for the party, but they have not been discovered or are being oppressed. These good comrades and advanced people, as Lu Xun said, are the backbones of the Chinese nation on whom we place our hopes. What action, then, should our party take to deal with those who oppress the newly emerging forces and who mock at or attack the advanced? I think our comrades will certainly know what to do.

The Second Question Is How To Rectify Party Work Style

First, it is necessary to greatly strengthen communist ideological education, to widely publicize good people and good deeds and to greatly support the advanced people and newly emerging things; it is necessary to clear the way for their advance and to get rid of all difficulties and obstacles in their work. We would like to tell all those who do not support newly emerging things or who have placed obstacles in their way of advance: We shall not punish you, but would you please leave your posts or be transferred to some other posts? If you are old, you should retire or leave your posts for convalescence.

I spent 2 and 1/2 days listening to the report given by Xiangfan municipality. This city has done quite a good job. In the past, Xiangfan was a very backward city. In the early years after liberation it had a little handicraft industry but was without other industry. Its total industrial output value amounted to only 50 million yuan. This increased to 100 million in the early years of the "Great Cultural Revolution." After the "gang of four" was smashed, its output value rose to only 600 million yuan in 1978, then this amount increased by 200 million yuan each year in 1979, 1980 and 1981. At present it has reached 1.2 billion yuan. Taking the city's population as a basis for calculation, the average industrial output value per capita is 5,000 yuan. They have indeed done a good job. Their experiences should be summed up and passed on to others. The first enterprise in Xiangfan to become well-known throughout the country was the Xiangfan textile mill. It was already one of the five national advanced units in 1963. Comrade Liang Yanbin was an advanced figure of this factory. I once wrote an article of several hundred words, entitled "A Red Banner," in praise of her. Nevertheless, she was persecuted and afterward locked up. Premier Zhou received her once and Elder Sister Deng was moved to tears while reading about her deeds. At present, the Xiangfan textile mill has become a big factory and has been divided into two. Its annual output value has now reached 170 million yuan. This factory started with only several dozen foot-operated weaving machines. I suggest that this factory set up a factory history exhibition room and hang in it photos of all its advanced people together with written descriptions of their deeds. The moment young workers are recruited into this factory, they should be educated in the factory's history. We should often organize veteran workers to tell young workers about the factory's history so that they may maintain the glorious tradition of self-reliance and hard struggle in pioneering a great cause. Their present factory director is a 38-year-old comrade. He has a family of four and they are living together in one room. New dormitories have been built in this factory on several occasions. Yet he, as well as seven other leaders including the factory's party committee secretary, are still living in their original places. I told him that this alone will cause him to enjoy prestige among the workers irrespective of his capability. Although we live in poorer houses, we enjoy prestige among the masses. This is the greatest happiness of party members. If we rush to occupy new houses and live better, the masses will curse us behind our backs with their fingers pointing at us. Which, in the end, is better? What is gain and what is loss? Is this not very clear already? The Xiangfan textile mill should write its factory history. Other advanced units should do the same. In our army, even a company writes its own history and all heroic people and deeds are recorded in it. The company history is used to educate new recruits. Why can we not learn this from the PLA? This glorious tradition of advanced units is very valuable. Is it not very good ideological and political work to educate the younger generation with this kind of tradition? Do not oversimplify our ideological and political work. How can our work be successful if we indulge in empty talk and abstract principles?

Comrade Ma Xueli also talked to me about his factory. In the fourth quarter last year, no bonuses were handed out for 3 months because the factory's production plan was not satisfactorily fulfilled. Ideological and political work was then carried out among workers. As a result, production rose instead of dropping. This has proved that production will increase if ideological and political work is properly carried out. We cannot rely on bonuses alone to arouse enthusiasm and put "money" before all other things. Comrade Fan Zhongzhi, who is a veteran worker and a long-standing model, told me that we are buying enthusiasm with money. He said that this will not do and will not last long. Enthusiasm cannot be bought with money. We had better strengthen ideological and political work and carry out communist ideological education.

I also listened to Wuhan municipality's report on carrying out the "five stresses and four points of beauty" activities and was greatly inspired. At present, "five good families," "five good blocks," "five good streets" and so on are not yet common. But as long as there are some advanced units, we have got a foundation and the direction for our advancement. If we persist in this way, we will be able to completely overcome the unhealthy trends in society. This is called foundation work and mastering skills. The report also contains good experiences in remolding young criminals and in strengthening education for young people. Wuhan municipality has organized advanced figures into report groups. These people have given many reports on their own advanced ideology and deeds. These reports are very popular. I have made a suggestion to the Propaganda Department asking it to pass on and popularize this experience. There are advanced people in factories and streets, good professors and lecturers in schools and good party, CYL and administrative cadres in schools and factories. Is it not good to invite some of them to make reports in schools, departments, factories and streets in a planned way? At present, the political courses in many schools are not welcomed by the students there. This is a fact. However, there are also some teachers who give vivid and lively political lessons which are welcomed by students. Why can we not invite these teachers to give reports to teachers teaching politics? There is more than one such teacher. They can be found in primary schools, secondary schools and universities. Can we just depend on the few people of the Propaganda Department? On the one hand, we are few in number. On the other hand, we lack personal experiences. The things we learn come indirectly to us through listening to reports. Therefore, what we talk about cannot be so vivid, lively, deep or inspiring.

I have also heard the report of Comrade Guan Tao, secretary of the Wuhan watch factory party committee. This factory is a good typical example of carrying out scientific management among our enterprises. Their achievements merit emulation by our factory party committee secretaries and factory directors as well as by the leading cadres of our organs. Although this factory is still rather backward in equipment and industrial technology and is not as good as some of the enterprises in capitalist countries, no developed capitalist country can run a watch factory like we do! The cadres and workers of this factory love the factory like their own home and have such a good communist style. Therefore, the factory is very well run. This factory was designed for a production capacity of 300,000 watches a year. Last year, production reached 530,000 watches and taxable profit of the year amounted to 19 million yuan, or more than the total investment of this factory. A very significant event occurred in the factory. The son of a leading cadre of the army worked in the factory. He applied for leave to visit relatives with his mother. The factory party committee found out that he was not going to visit relatives but was going to take a trip to Lushan, and turned down his request. Perhaps because of his powerful connection, the young man said that he would take his leave with or without permission, and consequently went away for 2 weeks. When he returned, he not only did not make a self-criticism, but also said that they could dock his pay and that he was prepared to sacrifice 3 months' pay. How do you deal with this sort of person? The factory party committee held a meeting to discuss this problem and also mobilized the workers to hold a meeting. In the end, they decided to dismiss him. Why did he have to be dismissed? If this person was not dealt with, then the children of other cadres could also go to Lushan without taking leave. If they allowed the children of cadres to disobey factory rules and regulations, how could they set demands on and educate the other workers? Therefore, taking the situation as a whole into consideration, they decided to dismiss him. Is this, in the final analysis, an act of attacking or an act of cherishing? I say this is an act of cherishing. When he goes to work again in the future, he will behave himself and observe discipline. They have more children of cadres in their factory. In assigning work, they treat the children of cadres the same as the children of other workers and give them no special privileges. One year there was only a single party member among the new workers entering the factory, and the factory assigned him to the kitchen to work as a member of the kitchen staff. From the start, he took the lead. Later, they also assigned two children of cadres to work as kitchen staff. Everybody thinks very highly of working in a watch factory because they can wear a white coat. However, there are all kinds of work in the factory and no one is willing to work in the kitchen. Although the work in the kitchen is dirtier, more arduous and tiring, they still convinced the cadres' children to set the pace by going to work in the kitchen. Is a party committee upholding the principle of the factory in this way not worthy of our emulation? With such good comrades how can we not make a success of the work style of the party? How can we not make a success of our enterprises?

In all our work we must properly grasp this key link of ideological education. The policy of the party Central Committee is to grasp with both hands. In one hand we must grasp material civilization, and in the other hand we must grasp spiritual civilization. Economic construction is the center of all our work. All our work, including ideological and political work, must be centered on economic construction. However, under the premise of division of work between the party and government and under the premise of the party committee having a good grasp of the major problems of the policies and principles of economic construction and the major problems of planned economy, the emphasis of the routine work of the party committee should be placed on the building of spiritual civilization and on grasping party work, mass work and ideological and political work.

Second, our veteran cadres must be models in correcting party work style and must pay attention to the training and choosing of successors. This is the glorious responsibility of veteran cadres. I have had a few heart-to-heart talks on this problem with some of the veteran cadres present. Our veteran cadres have all been through a long period of tempering. All of them have been involved in the revolution for more than 10 to 20 years. Some of them have worked in the underground organizations of the party and some have worked in revolutionary base areas. When we joined the revolution, whoever thought that "we were bound to see the triumph of the revolution"? At that time, we all believed in the inevitable triumph of the revolution, but we never gave a thought to whether or not we would see it for ourselves. For in the White areas, nobody knew when the Kuomintang would arrest you and chop off your head or when you would be killed in battle. Did any of the comrades ever think what kind of an official he would become after the triumph of the revolution, what kind of a house he would live in, what kind of a car he would ride in or how much pay he would receive each month? At that time, they only thought about how much salt and edible oil cost. If times were good, they received a little subsidy. If times were bad, there was no subsidy. During the war of resistance against Japan, I was, together with Comrade Song Renqiong, in Jinan. Because there was a famine, we received a special ration of 5 jin of beans a month. Every day, we would cook a little soybean for food. Sometimes, we would grow few bean sprouts, and that was considered a special treat. At that time, did anyone complain of hardship? Did anyone say not to engage in revolution because of the hardship? Even when they endured hardship and they were wounded, they still made revolution. The revolution would only end when they were killed. But until their death, they would make revolution. In his political report delivered at the seventh party congress, Comrade Mao Zedong said: "Countless revolutionary martyrs have laid down their lives in the interests of the people, and our hearts are filled with pain as we the living think of them. Is there any personal interest, then, that we cannot sacrifice or any error that we cannot abandon"? This talk of Comrade Mao Zedong's was extremely inspiring at that time. Is it not still very inspiring when we read it now? Let us think of the comrades in arms who fought together with us in the past and how many of them are still alive today! In the early part of 1937 when I was working in the Jinan work committee, we had four committee members. Today, I am the only one living; the other three comrades sacrificed themselves. We who survived the revolution are able to witness the triumph of the revolution. Is this not the greatest blessing? What more could we ask for? Veteran comrades who really have large families and many mouths to feed or who are in poor health and straitened circumstances will be looked after by the state. Now the party Central Committee has again emphasized that proper arrangements must be made for the veteran cadres who leave their posts or retire and that their political treatment and livelihood treatment must be well looked after. We should see that the party and people have treated us fairly and made our life comfortable. Some of our veteran comrades still bear the scars of wounds, some in one place and some in several places. Some are still carrying bullets which lodged in their bodies. These are of course records of their glorious past. However, this kind of record is only a demonstration that we have the courage to devote our lives to the communist cause, and we cannot use it as capital for seeking fame and wealth or enjoyment. Today, the posts we hold are quite high and we are also quite well off. If we still go in for unhealthy tendencies, how can we be worthy of the martyrs who have died? How can we be worthy of the former glorious tradition of hard struggle and fearing no sacrifice? How can we be worthy of the party which trained us and the people who have confidence in us? I have told the veteran comrades who made mistakes: If you want other people to respect you, you must first respect yourselves, respect your glorious past, respect your former good work style and don't throw them away. If you throw them away and engage in unhealthy tendencies, how can people respect you! You must not ruin your own prestige!

As for our children, should we ask them to seek special privileges or should we ask them to identify themselves with the children of the workers and peasants? Our children, regardless of whether or not they have reached the age of maturity, will all be looked after by the state and society, and we should not worry about them. The principle of our party is: we definitely cannot spoil them, we definitely cannot allow them to have any feeling of superiority and we definitely cannot allow them to have any special privileges in life. Only by educating them at a tender age to have communist morality and value and imbuing in them the lofty ideals of struggling all their lives for the revolution and for the people can they identify themselves with the workers and peasants and can they develop into useful people. If we pamper them from childhood and are always asking them to eat well, dress well, seek privileged work and enjoy preferential treatment so that they regard themselves as special people, they will become divorced from the masses of workers and peasants and there will be no future for them. Therefore, how we cherish our children is a vital problem. We definitely have a handful of cadres' children whose behavior is not good and they are a bad influence. Last year, I specifically talked about this problem because there was an unhealthy trend at that time which held that all veteran cadres were bad and sought special privileges and all their children were also bad and sought special privileges. I have criticized this viewpoint because it was not based on facts. According to a study carried out by the Central Discipline Inspection Commission, the proportion of children with bad characteristics whose parents are cadres is, on the whole, the same as that of children whose parents are not cadres. The children of some of our cadres are extremely good, and their characteristics are very good regardless of whether it is in their study, their work or their life. However, there is definitely also a handful of them who are not so good and who have even become criminals. We can only blame ourselves for not teaching them properly. A handful of veteran cadres have lost their revolutionary will and their minds are contaminated by incorrect things. Some of our "ladies" are fond of spoiling their children, gaining petty advantages and using the back door. I am not saying all female comrades, but some female comrades are doing these things. Do you call this honorable? This is only bringing shame on yourself. Other people are not doing this to you; you are doing this to yourself and disgracing yourself! We are veteran cadres and leading cadres. If we go in for these kinds of unhealthy tendencies, are we still qualified to talk about other people?

Our veteran cadres must set strict demands on themselves in accordance with party spirit. They should resolutely eliminate any unhealthy tendencies. They should evacuate houses which they have seized. They should hand over to the state the things which they have obtained by foul means. They should actively make self-criticism for their mistakes such as giving and accepting bribes, return what they have unlawfully taken, and pay necessary compensation. They will not be punished if they take the initiative in admitting and correcting their mistakes, making self-criticism, returning what they have unlawfully taken, and making compensation for losses. Those who have seriously violated the state law and party discipline and must be punished for their misdeeds are to be dealt with leniently if they confess their crimes and correct their mistakes. This is the first point I want to talk about with our veteran cadres. I ask them to prove themselves models in rectifying party work style.

Another particularly important task for our veteran cadres is that they must seriously select distinguished middle-aged and young cadres to be our successors and that they do a good job of passing on experience, giving help and setting an example in the course of training middle-aged and young cadres. This is a question of primary importance. We should do this task while our veteran cadres are still around because they know what kind of successors should be selected. It will be too late and cause delay in our work if we do not hurry with this task now. When the 6th Plenary Session of the 11th CCP Central Committee concluded, Comrade Xiaoping and Comrade Chen Yun asked the first secretaries and the ministers to stay to talk about the question of selecting middle-aged and young cadres. Our leading group must be revolutionized, better educated, more professionally proficient and younger; otherwise it will be impossible to build a powerful, modernized socialist country. The Hubei provincial metallurgical bureau has 1 director and 10 deputy directors. It is now necessary to send one of them to stay at a selected grassroots unit to help improve its work and gain firsthand experience for guiding overall work. But none of them can be sent. During the initial postliberation period, the Hubei provincial government had only one chairman and two vice chairmen and each of its departments (bureaus) had only 1 director and a few deputy directors. They could work properly! Why are there so many directors and deputy directors now? Because it is necessary to make adequate arrangements for and take good care of them. Which is more important, an individual or overall work? Our old comrades must actively yield their positions to the middle-aged and young cadres who firmly carry out the party Central Committee's line, are of good moral character, have scientific and cultural knowledge of a high level and are full of vigor and vitality. As far as this question is concerned, the biggest obstacle is not the withdrawal of veteran cadres. The veteran cadres are sensible. When adequate arrangements have been made for them, they will serve as advisers, leave their posts for convalescence or retire once they are called upon to do so. However, it is often very difficult to promote the middle-aged and young cadres. The first reason is that the veteran cadres are not unified in thinking. One says this young cadre is good and another says that young cadre is better. Can anyone be perfect? The veteran cadres have shortcomings. How can they ask the middle-aged and young cadres to be perfect? The second reason is that the middle-aged and young cadres compare with one another and one is unwilling to submit to another. Why are you promoted and why am I not promoted? By how much are you better qualified than I am? The middle-aged and young cadres are also particular about seniority. I reasoned things out with them once in Guangxi. The party committee secretary of a county there was a female comrade. She was 35. I said that I would vote for this female if a party congress was to be held in the region to select its committee members. I told them why: There are other comrades in their 40's or 50's who have served longer than she has and are more capable than she is. Yet, it is better to select her than to select these comrades, because we want to train young cadres. She is young and is a university graduate with a fairly good educational background. Moreover, she has been working as a party county committee secretary for 6 years, has done her job with good results and has been tested in practice. Why should she not be selected? If we do not consider a problem in this way, we shall not have the courage to surmount obstacles and solve this major problem. This is the second point I want to talk about with our veteran cadres.

Third, the problem of criticism, self-criticism and strict enforcement of discipline. What does the present situation look like? In my opinion, since the forum on problems on the ideological front, we have made considerable progress in developing criticism and self-criticism and in overcoming laxity and weakness. However, we have as yet failed to conduct criticism, self-criticism and inner-party democratic life in a perfect, frequent, strict or conscientious manner and the rotten liberalist work style that Comrade Mao Zedong once criticized still prevails in many places. Some comrades in our party, including a few veteran cadres, are trying not to hurt anybody's feelings. They do not criticize those who must be criticized or punish those who must be punished and sometimes they even shield and beg leniency for offenders. They do not adopt the party's standard and criticize those who have committed mistakes. On the contrary they intercede for them. Some comrades in the Hengyang Municipal CCP Committee told me that it is very difficult to punish a cadre now and that people will plead for mercy for him when you are only investigating the cadre's case before making any decision. This kind of phenomenon does exist though it is not prevalent. Why do we, revolutionaries who must not fear even death, fear to criticize those we must criticize? Some comrades fear that by doing so they will hurt the feelings of some people. They said that "the more flowers one grows, the more thorns one gets." Moreover, they called this a lesson drawn from the "Great Cultural Revolution." Indeed, during the "Great Cultural Revolution" there were some people who avenged themselves on the people who criticized and punished them in the past, but this is not where the basic lesson of the "Great Cultural Revolution" lies. The most basic lesson is that political struggle was completely wrong. Therefore, we should vigorously pay attention to overcoming laxity and weakness, conducting criticism and self-criticism and perfecting the democratic life of the whole party. We should also vigorously combat liberalism. I hope that our comrades will read Comrade Mao Zedong's "Combat Liberalism," use the article to check their own activities and find what they should pay attention to correcting.

Here, I should call attention to the following problem. In our party, there are relationships between old comrades in arms, old classmates, old colleagues and between old chiefs and old subordinates. These relationships go back a long way. Now some new relationships have been added to the old relationships, for some children of veteran cadres have married some children of other veteran cadres. The relationships of the younger generation have been added to those of the old generation. There is nothing to blame in these relationships. The question is how we should regard these relationships. Should we treat the parents-in-law of our children in a feudal manner or treat them in accordance with the principles of the CCP? Comrade Chen Yun said: Tell the truth, do not save face. Regarding the above-mentioned state of affairs, I should like to add, in accordance with what he meant, the following words: We should be particular about principles instead of relationships. By being particular about principles, we mean that we should always do things in accordance with principles, even if our relatives and friends are involved. Your children must accept whatever kind of jobs they are assigned. If they are admitted into institutes of higher education, they should be college students. If they are offered jobs after recruitment examination, they should take the jobs no matter whether they are in state-owned or collective enterprises. Even if they are assigned the job of selling flat bread, they should accept the job. The day before yesterday, I watched a TV play called "The Girl Who Sells Flat Bread." Why can the children of our cadres not be flat bread sellers or dustmen? Certainly they can. Therefore, our comrades should not proceed from the feudal, vulgar or backward aspects of these relationships or exploit these relationships to shield one another or to plead for mercy for one another. Thus they will fail to criticize those they ought to have criticized and fail to punish those they ought to have punished. On the contrary, our comrades must handle these relationships in accordance with the stand of a party member, with our party spirit and with our party's principles. At present there are quite a few people who use these relationships to conduct unhealthy practices, call their conduct the "study of relationships" and call these relationships "under-the-counter relationships." We must be very carefully on our guard and resolutely put an end to and correct these errors.

As for the methods of criticism, the central leading comrades have repeatedly mentioned them, that is, we should seek truth from facts and avoid confusing two kinds of contradictions that differ in nature and confusing right with wrong, and we should be strict and conscientious in conducting criticism. We should remember well the historical lessons and avoid mechanical and excessive struggle. We should not conduct criticism in an unfair and exaggerated manner. We should not jointly attack people or compel them to make self-criticism. We should allow those being criticized to argue their cases and we should not refuse to listen to them when they argue their cases. We should never repeat those "leftist" practices. Moreover, we should not indiscriminately involve the upper and the lower levels connected with the people who have committed mistakes. The past practices of involving all those who have worked under a leading person who has committed mistakes should never be repeated. Our criticism and self-criticism is aimed at strengthening the party's solidarity, heightening the party's combat effectiveness and maintaining and carrying on our party's fine traditions. Besides this, there is no other aim.

Our party committees at all levels should be resolute and by using the weapons of criticism and self-criticism and daring to fight all kinds of unhealthy tendencies, conscientiously rectify party work style. In order to put an end to unhealthy trends, they must strictly enforce discipline. There is the party discipline for party members, the law for everyone, and the relevant regulations in factories, schools and organizations. All these must be observed by the people concerned without exception. First we must educate people. Second, we must formulate regulations and discipline. Third, we must strictly enforce these regulations and discipline. Once they are formulated, they must be strictly enforced. That is why we must be very prudent in formulating them. In formulating them, we should organize the masses to discuss them so as to make them as rational as possible. The more important thing is to intensify ideological education in order to raise the ideological awareness of the people and help them to become honest laborers and correct their mistakes when they commit any. We should leave a way out for those who have committed mistakes or even serious mistakes. This means that we must be very prudent in meting out organizational punishment to them and must leave some room for further maneuvers. Moreover, if those who have committed mistakes and received punishment have really admitted and corrected their mistakes and if this is supported by factual evidence, we should appoint them to important posts according to their abilities. We should not seize on their mistakes or make those who have committed mistakes feel that they have no prospects at all.

Fourth, on independence and initiative, seeking truth from facts and the mass line. They are the three major points of the living soul of Mao Zedong Thought. Independence and initiative, and self-reliance is a policy that not only the state but also all the provinces, all the areas, all the enterprises and all the service units must follow. This does not mean that all the provinces, all the areas, all enterprises and all the service units should develop in an all-round manner and produce everything they need. It means that they should act in accordance with Comrade Mao Zedong's teaching to build the country and develop all undertakings in a thrifty manner. They should keep this spirit of arduously conducting the cause for a long time and should never discard this spirit. Even when our country is very well developed, we should preserve and carry on this spirit.

Another point is seeking truth from facts. This is our party's ideological line. Comrade Xiaoping has expressed the line perfectly. He said that the line means emancipating our minds, using our brains, integrating theory with practice, seeking truth from facts, studying new conditions and solving new problems. As far back as during the Yanan rectification movement, the CCP Central Committee stressed seeking truth from facts and the mass line. On the eve of the victory of the war of resistance against Japan, I studied at the Yanan party school for 1 year. At that time I learned these two points at the school. However, the later practices have proved that it was precisely because we went against the principle of seeking truth from facts and acted unrealistically that we committed so many mistakes, especially the great number of blunders during the "Great Leap Forward." In order to really act in the manner of seeking truth from facts, we should first have the desire to seek truth from facts instead of the desire to please the public with claptrap. Another thing we should do is to conduct investigation and study in practice and go deep among the masses and never fear difficulties and hard work in conducting investigation and study. One important aspect of our bureaucratism now is the great number of meetings and documents. This is a problem that we often discussed before the "Great Cultural Revolution," but we have not solved it as yet even in our central organizations. That is why Comrade Hu Yaobang is always repeatedly stressing that our leading comrades at all levels should go out of their offices to basic-level units in order to contact the masses and the basic-level cadres and in order to learn from them. To actually act in this manner, we should have strong will power. If we do not go out of our offices, and if we keep attending meetings and writing documents all the time, we are precisely bureaucratists. I do not believe that we really have so many meetings to attend and so many documents to write. How can there be any harm if we attend fewer meetings and write less documents!

A third point is that our methods should be correct. We should understand materialist dialectics and should not act in a metaphysical manner or under subjective prejudice. When some of our cadres go to the lower levels to inquire into how things stand there and when some of our reporters are gathering news, they already have some fixed ideas in their minds, that is, some subjective prejudices, and their only aim is to find evidence to prove their ideas. This is a subjective method. Marx, Lenin and Comrade Mao Zedong all told us that the conclusion should never be reached before making investigation and study and that the conclusion should only be reached after making investigation and study. Engels explained this point more penetratingly. He said that if one wants to understand the truth about things and if one wants one's understanding of the truth to be completely free from distortion by any subjective factors, one has to understand the essence of objective things as they really are and to understand the law governing objective things. Therefore, in order to act in the manner of seeking truth from facts, we should raise our capability of understanding. If we do not study theory, we will not be able to understand the fundamental tenets of Marxism-Leninism-Mao Zedong Thought; thus we will not have any weapons. It is of great importance what theory and methods we use to guide our investigation and study and to guide our analysis of problems. We often find the following state of affairs: with regard to the same fact, people often differ in their views. Some of them hold the correct views and some do not. What is the reason for this? The reason is that some people are not guided by Marxism-Leninism-Mao Zedong Thought. In training and fostering middle-aged and young cadres, we should especially pay attention to this problem. We must encourage and help those who have a great deal of practical experience but are poorly educated and have a poor understanding of theory, and even those who are relatively well-educated but have a poor understanding of theory, to raise their theoretical level. In order to achieve this we should adopt various measures, such as giving study courses and training courses and holding reading meetings. Only when we are armed with Marxism-Leninism-Mao Zedong Thought can we really understand the essence of things behind the phenomena and can we really understand the law governing the development of objective things. Empiricism is a bad thing. The "gang of four" used combating empiricism as an excuse to negate us old cadres. We should expose their evil tricks. But we should not deny that empiricism is a bad thing. Some of our old cadres joined the revolution a long time ago and have indeed gained plenty of experience. This is also the case for a few middle-aged cadres who have been county CCP committee secretaries for many years and have also gained plenty of experience. But their shortcomings are unwillingness to read Marxist books and unwillingness to study theory. As a result, they are restricted by their narrow experience and their ideological standard cannot be raised. The middle-aged and young cadres we have promoted will not have broad prospects and will not be competent for the posts of being responsible for all the work independently if they do not study theory.

The mass line has already become a platitude. However, it remains a problem how to carry out the mass line in our work. Everybody understands that whatever work we do we are serving the people. Nevertheless, not all our comrades really understand or really adhere to the principle that whatever work we do we must rely on the masses of people. Some comrades always regard themselves as being cleverer than the masses and are not willing to modestly listen to the opinions of the masses. Why is there coercion and commandism? Coercion and commandism comes from a lack of confidence in the masses. Because of this lack of confidence in the masses, some comrades always try to force their opinions on other people and compel the masses to carry out their orders. In conducting revolutions, leaders are, of course, very important, but in the final analysis, we must rely on the masses of people. It will not do if we rely only on a few leaders or on the party. How could we have achieved the victories of the revolution if our party had not relied on the support of the people throughout the country? Can we, a few cadres and a few party members, build the two civilizations and build a powerful socialist China if at present we do not rely on the broad masses of people and if we do not give play to their initiative and creativeness? No, we cannot. The most important reason why during the past few years our agricultural production has developed relatively quickly lies in our adoption of correct general and specific policies which have brought into play the initiative of the broad masses of peasants. Otherwise, if we continue the old ways such as coercion, commandism, blind commands, egalitarianism, ordering the peasants to work by striking bells, ordering them to work overtime until midnight and conducting other formalist activities, we cannot achieve any results in developing production, even though we tire our peasants out and make them suffer hardships. Some comrades often follow the trend; therefore they cannot adhere to the mass line. As soon as they hear the sound of wind, they think that it will rain. As soon as they heard that the production responsibility system should be established, it seemed to them that there were no other forms of the production responsibility system except for fixing farm output quotas for each household and assigning the households full responsibility for task completion. It seemed to them that the Central Committee's document No 75 was out of date. In some production teams the masses wanted to establish the responsibility systems of fixing farm output quotas for each household and assigning the households full responsibility for task completion, but the cadres' thinking was not straightened out and the cadres obstinately refused to establish the system. In some production teams where conditions were relatively good and output was relatively high, the masses had objections to the establishment of the system of fixing farm output quotas for each household and the system of assigning the households full responsibility for task completion, but the cadres, having heard the trend in other teams, forced the people there to establish these systems. These practices violated the mass line and the Central Committee's policy. If we want to follow the CCP Central Committee, we should act in accordance with its formal directives. Did the No 1 document issued by the Central Committee this year not reiterate that the No 75 document's spirit remains in force? The spirit of the No 1 document can be summarized in the following words: acting in the light of local conditions; giving different guidance to different kinds of teams; centralizing what should be centralized, and assigning what should be assigned. This is the only realistic way of doing things. According to the different conditions in the production teams and according to the opinions of the masses, various different forms of production responsibility systems can be established in a single production team. We should rely on the masses to solve the problems of what the production team should produce, what it should not produce, how to develop the diversified economy and how to develop the responsibility system well. However correct our party's line and policies are, they cannot work unless the masses voluntarily act to carry them out. When Comrade Mao Zedong talked about the mass line at the seventh CCP national congress, he said the following words: The highest criterion to check a communist's words and actions is whether they conform to the greatest interests of the broad masses of people and whether they are supported by the broad masses of people. These words can be our maxim.

Finally, I would like to talk about the question of unity. The party's unity and solidarity are our party's life. The first thing regarding the party's unity is to unite around the party's Central Committee. The whole party must adhere to the four basic principles put forth by the Central Committee. We must adhere to these four basic principles throughout the entire period of socialism. We must resolutely implement the party's line, principles and policies. Otherwise, the entire party being subordinate to the Central Committee will become empty talk.

In order to strengthen unity, we must resolutely implement the system of democratic centralism and no one should violate it. We suffered heavy losses in the past for violating the system. There were various causes of our mistakes in history but an important one was that the party's system of democratic centralism and the party's democratic life were damaged. If the party's democratic centralism had been correctly implemented, the "Great Leap Forward" in 1958, the "campaign against right opportunism" at the Lushan meeting and the 10 years of the "Great Cultural Revolution" could all have been avoided. In February 1967, many Politburo members, vice ministers and comrades of the Military Affairs Commission Standing Committee came forward to oppose the "Great Cultural Revolution." I think that if the Politburo had convened a meeting according to the normal principle of democratic centralism to discuss whether or not the "Great Cultural Revolution" should be conducted and how it should be conducted, the mistake could have been corrected in good time. Could we not have drawn a relatively correct conclusion if we had truly implemented our party's system of democratic centralism, allowed everyone to air his views and drawn on collective wisdom? Therefore, in order to draw a lesson from historical experiences, our party committees at all levels, starting from the Central Committee and without exception, must act in accordance with the party constitution, implement the system of democratic centralism and practice collective leadership. We must submit ourselves to what the party committee has adopted even though we may have reservations if we hold different views. No individual or minority, including first secretaries, should change the collective's decision and damage democratic centralism. We should never permit such things as the cult of personality and everything being decided by one person alone to appear in our party again. This is one of the basic experiences and lessons which was summed up in the resolution adopted at the sixth plenary session. We should never repeat such a mistake.

Besides, we should also pay attention to what Comrade Mao Zedong said in the second point of "Work Methods of Party Committees." We hope our comrades will read it again. It will be of great benefit to do so. How should we improve leadership of party committees? In dealing with problems of principle, we must not make accommodation, compromise or give way but must have them thoroughly thrashed out. In dealing with problems which do not concern principle, we should not enter into endless arguments. Leading comrades of party committees at all levels are required to support each other, help each other, love each other and have mutual understanding. We should place problems on the table for discussion and should not talk behind people's backs. Talking behind people's backs violates the party's discipline and is harmful to the party's unity. To date, there are still some undesirable phenomena in our party. What the party standing committee discusses in the morning will be spread all over by the afternoon. Even before a decision is made, news about which cadres the party committee has criticized, which cadre it has discussed and which cadre it will promote sometimes leaks out. How can we strengthen our party's unity and increase our party's combat effectiveness if we do not overcome such liberalism and anarchism? This problem must be solved. If unity is achieved in our party and in particular among members of party committees and their standing committees, if these people take concerted action, keep in step, speak in one voice and if organizations at one level spur on and bring along those at another level, we are sure that the party's work style, the general mood of society, social order, economic construction and the spiritual civilization will all be improved or enhanced. But if misunderstanding remains among members of party committees and in particular among members of party committee standing committees and if they do not speak in one voice and do not take concerted action, it will never be possible for them to lead millions of people in fighting. Our comrades should never underestimate this question. This is a major question. Unity among members of a party committee on the basis of Marxism-Leninism is also the experience of the watch factory about which Comrade Guan Tao told me. Comrades of the watch factory are not particularly wiser either but they have done very well in this respect. Why then are our party committees, our prefectural party committees, our county party committees, party committees of other factories and our bureau party committees and party groups not able to do so? At present, the problem of disunity is still quite serious in leading groups of some departments and units. This is very harmful to our work and we must solve this problem. I hope that our provincial party committees and municipal party committees will all strive to strengthen leading groups. At present, the leading core of our party Central Committee is very strong and powerful and is closely united. The party Central Committee has already set an example for the whole party. Why can the whole party not learn from the Central Committee? Why should we not learn from the party Central Committee?

What I have said may all be included in the question of the party's work style and can also be considered as a question of building our party. The reason we scored victory in revolution in the past was that we had a good party, a Marxist-Leninist party. At present, if we want to carry out socialist modernization, we also need a Marxist-Leninist party and a good party before we can attain our great goal. To improve our party's work style is to do a good job in building our party so that we can have a party which is armed with Marxism-Leninism, which has the spirit of criticism and self-criticism and which has close ties with the masses. In this way, we will certainly be able to fulfill the new tasks in the new period. Is there hope to do a good job in building our party? I have already said that there is much hope. We have a good party Central Committee and we have a great number of good cadres and party members in party committees at all levels, including party committees at basic levels. Besides, there are also a great number of activities outside the party which constitute a newborn and an advanced force. An advanced force will not be defeated by any decadent force. History has been developing in this way. We are Marxists and we understand this truth of historical materialism. We must strive to bring about a decisive change of the party's work style this year. We must first of all depend on leading cadres on all fronts and depend on their exemplary and leading role. We are wrong if we are not aware of the seriousness of unhealthy trends of our party's work style. We are also wrong if we have no faith in rectifying the party's work style and overcoming the unhealthy trends. What we must do is to adopt correct methods. As was put forth by Comrade Deng Xiaoping and adopted by the Central Committee, we must overcome the lax and weak situation of our party in ideological and political work, in criticism and self-criticism and in enforcing discipline. The whole party must strive to become stronger, more powerful and more united. We must use Marxism-Leninism-Mao Zedong Thought as a weapon to fight against various kinds of erroneous ideas, erroneous trends and evil practices and develop our party's fine tradition. Our party and our cause have a bright future.

ATTACH GREAT IMPORTANCE TO RAISING LABOR PRODUCTIVITY

Beijing RED FLAG in Chinese No 5, 1 Mar 82 pp 14-16

[Article by Editorial Department]

[Text] Our country's total industrial and agricultural output value grew by 4 percent last year as compared with that in the preceding year, exceeding the planned growth by 3 percent. Total grain output was close to the all-time high in the record year of 1979. New achievements were made in the growing of industrial crops and in animal husbandry, forestry and fishery. However, the conditions of industrial production were not as good as those of agricultural production. This was chiefly because production in some heavy industrial enterprises yielded rather poor results. In particular, in the state-owned industrial enterprises, labor productivity dropped despite the payment of much greater bonuses. We should pay close attention to this state of affairs. There were many reasons why some enterprises did not carry out production well. An important reason was that they did not work with all-out efforts. We must work with all-out efforts and must not be disheartened. Our party's leading organs at various levels should courageously resist all unhealthy tendencies, stop all illegal activities, and criticize bureaucratism and undisciplined behavior.

With regard to the method of leadership, the leaders in charge of production and industry should go to the grassroots level to discuss problems and visit factories. It is impossible to push work forward by just sitting in the office and wracking one's brains to find a way to do the work. We have discovered two wrong methods of work: The first is that the leaders do not go to the grassroots level to make investigations but just sit in their offices to make calculations. The second is that the leaders do not make contacts with the technicians and workers at the grassroots levels but only with people at the higher levels and only ask the state to make additional investments. Comrade Chen Yun said during the 1950's that it is imperative to spend more than 90 percent of our time on making investigations. When we do not know enough about conditions, we should bestir ourselves and visit factories and departments one by one to learn about conditions. Once we acquire more knowledge, we can work out good methods.

To realize socialist modernization and to handle properly the relationships between the parts and the whole, and between unified leadership and decentralized management, are matters of great importance. In building our country, we should coordinate all activities like pieces in a chess game. In carrying out economic activities, we should act according to plan. In developing the national economy, we must put the main emphasis on planned economy while bringing into play the supplementary role of regulation by market mechanism. In giving greater decisionmaking power to industrial enterprises and carrying out various forms of the responsibility system in agricultural production, we do not mean to discard unified leadership and planning. In carrying out agricultural production, we should also put the main emphasis on planned economy while bringing into play the supplementary role of regulation by market mechanism. Regulation by market mechanism can only play a supplementary role within the scope of the state plan. All localities and departments should be developed according to state plan, and the important ones should be developed before the less important ones. Only thus can we integrate immediate interests with long-term interests, partial interests with general interests, and build our country well.

By putting the state plan and the general interests in first position, we do not mean exercising rigid control. We have been exercising rigid control in many branches of work. Ours is such a vast country with so much work to do and such complicated economic problems to deal with that no one can know everything. Under the present administrative system, it is impossible to exercise rigid control without clearly understanding the overall situation. We should not adopt the method of exercising rigid control; we should adopt the method of unified leadership and decentralized management, which is a method compatible with dialectics. What does leadership mean? It means that unity should be achieved in determination, understanding, making of principles and policies, and formulation of a plan in major matters, while decentralization should be practiced in business management and handling of other matters. Our party has always acted in this way. We are not supernatural. How can we do everything in a unified manner? The party has stated many times that unity is stressed only in leadership and that business management should be conducted in a decentralized manner and administrative matters handled by different levels. We should not fear the word "decentralization." It means the taking of responsibility by different levels or individuals. We only oppose decentralism, not decentralization. For example, in a campaign or battle, there must be a unified operational plan and a centralized command, but our forces should be dispersed, that is, decentralized operations are needed. Only in this way can we concentrate our forces to annihilate the enemy. For another example, when there are 100 people among us making an excursion to Xiangshan Hill, we should go in groups, one group taking one car and another group taking another car. This is dialectics in daily life. This is quite simple and there is nothing mystical about it. We know how to fight a battle and make an excursion. Why can we not act in the same way when we deal with economic problems? Why do we not understand this simple piece of reasoning? The method of leadership consists of two principles. The first principle calls for unified leadership and decentralized management. The second principle requires that one make investigations before one issues orders. An enlightened leader is one who devotes the greater part of his energy to making investigations, devising strategies, and considering problems concerning the line, principles and policies.

Our leading cadres at all levels should prove themselves to be enlightened leaders. They should investigate conditions, put forth suggestions and work out methods. They should assign concrete tasks to the lower level instead of taking everything into their own hands. For example, when housing is assigned in some administrative organs, why should the leaders do the assigning instead of letting the masses take charge? Why are the leaders, and not the experts and the masses, asked to examine literary and art performances? Work concerning the masses should be assigned to the masses. Why should our enterprises establish the system governing the workers' congresses and take the mass line? The reason is that when work concerning the masses is assigned to the masses, it will be possible to develop democracy in management and arouse the enthusiasm of the masses for managing their own affairs. Moreover, the masses are collectively wiser than any one of us, and only by pooling their wisdom can we do our work well. This is the method of leadership taught by Comrade Mao Zedong. We must be enlightened leaders and must not get bogged down in routine matters.

The key to accelerating industrial development lies in raising the labor productivity of enterprises. We should not confine our attention to demanding more investment from the state. It will not do if we place our hopes chiefly on the increase in state investment. At present, the state has limited revenues but heavy financial burdens so that there is not much money in the state coffers. If we do not place our hopes chiefly on the increase in state investment and if we do not demand investment from the state, are there any other methods? Yes, there are--such as increasing bank loans, raising funds by various means, actively making use of foreign capital, and so forth. There are many other things which the collective enterprises should be encouraged and guided to do.

Some comrades say that the labor productivity of our industrial enterprises is low because they are backward technologically, their equipment and installations are outmoded, and their working conditions are poor. We must admit that some of their equipment and installations are really outmoded. But we should look at this point analytically. We must see that some factories have highly advanced equipment and installations but poor management. In many more factories the cadres are lax in maintaining good morale and are seriously imbued with bureaucratism, and the workers ignore labor discipline, make no distinction between good and bad, and go in for egalitarianism. This is the basic cause of low labor productivity. At present, emphasis should be laid on strengthening ideological education, improving business management, strictly observing labor discipline and studying new techniques. With regard to the backward equipment and installations, our policy is to conduct technical renovation by the method of "walking on two legs," that is, in the first place, it is necessary to use a certain amount of capital funds to carry out some medium-scale technical renovations and systematically carry out major technical renovations. In the second place, it is necessary to arouse the masses to carry forward the aspirations of the Chinese working class and carry out minor technical renovations without asking the state to make investments. We should take this as a major principle and a resounding slogan for tapping potential and carrying out technical renovation. Some outmoded equipment and installations should be renovated step by step by mobilizing the technicians and workers of an enterprise to work hard and rely on their own efforts, so as to launch a mass campaign of renovating outmoded equipment and installations. Once the masses are aroused to put forth suggestions, there will be unfathomable potential for carrying out minor technical renovations without asking the state to make investments! This kind of mass campaign for promoting production should be launched to develop the national economy.

All economic departments should pay particular attention to the question of labor productivity. According to incomplete statistics, in the first 11 months of 1981, labor productivity in state-owned industrial enterprises dropped by 3.2 percent, profits dropped by 8.4 percent, the amount of floating capital increased by 1.8 percent, and production costs rose by 1.1 percent as compared with the figures for the same period of 1980. We should understand that a difference of 1 percent in labor productivity means a difference of 4 to 5 billion yuan in total industrial output value. This fact shows that although we have been talking about straightening out our industrial enterprises for 3 years, labor productivity has not changed for the better. This is a very serious problem which exists extensively in the country. It shows that we have not effectively straightened out our industrial enterprises. Of course, there are many reasons why labor productivity remains low. An important reason is that this problem has not been grasped seriously and pointed out clearly. In many enterprises at present, this problem has been dealt with not by increasing ideological consciousness, strictly enforcing labor discipline and improving business management, and asking the leading cadres and party members to take exemplary action to influence the masses, but by indiscriminately paying bonuses, going in for unhealthy practices and fleecing the state in the name of looking after the interests of the masses. This method will not work. Raising labor productivity is a major problem concerning the future of our country's socialist cause. The party Central Committee has seriously put this problem to the whole party and the working class of the whole country. Above all, we should tell the masses clearly and precisely about the drastic decline in labor productivity in industrial enterprises. In many localities at present, the authorities neither tell the masses about this situation nor report on it to the higher level. They even try to cover up this situation for different "reasons." Obviously they are wrong. How can this problem be solved without bringing it to the attention of the whole party and the working class? What are the key links in solving this problem? First, the leading cadres should display their revolutionary spirit, go deep into reality and improve business management by all possible means. Second, the role of engineers and technicians should be brought into play by giving them more respect and greater power and arousing their enthusiasm. Third, the broad masses of workers should be aroused to display their sense of responsibility as "masters of the house." We believe that the overwhelming majority of workers in our country, and old workers, model workers as well as advanced workers in particular, have the socialist consciousness. Provided our party committees at all levels point out this problem clearly and grasp it seriously and arouse the broad masses of workers and technicians to action, it will definitely be possible to change the condition of low labor productivity in the industrial enterprises of our country. We must be determined, with the effort of the whole party and by relying on the broad masses of workers and staff members, to strive for a marked increase in labor productivity in the near future.

IT IS A GREAT STRATEGIC TASK TO STRENGTHEN THE EDUCATION OF STAFF AND WORKERS IN REALIZING THE FOUR MODERNIZATIONS

Beijing RED FLAG in Chinese No 5, 1 Mar 82 pp 17-20, 48

[Special commentary by Yuan Baohua [5913 1405 5478]]

[Text] In February of last year, the CCP Central Committee and the State Council made the "decision concerning strengthening the education of staff and workers." This is a great strategic decision in China's four modernizations. It has great practical significance and far-reaching historical significance in realizing the policy of readjusting the national economy and the policy of maintaining stability and unity and building a high degree of socialist material and spiritual civilization.

I

The education of staff and workers is a reliable guarantee for continuing the development of the national economy. Marxist political economics maintains that the development of social productive forces relies on man's mastery and application of cultural and scientific knowledge. One outstanding characteristic in the development of modern economy is the large increase in the proportion of the labor force which has received a high degree of various types of training. The inevitable trend of the development of production is more outstanding in highly industrialized capitalist countries. Take the United States for example. From 1900 to 1976, the number of specialized technicians and management personnel rose from 17.6 percent to 49.9 percent of the total number of its staff and workers. Great changes took place in the quality and structure of staff and workers. The quality of the labor force was greatly improved, and this promoted a rapid increase in the economy. Viewed from the Marxist theory of reproduction, the education of staff and workers occupies a very important position and role in economic construction. In carrying out modernization and persistently developing the national economy, we must persistently expand reproduction and constantly raise the level of productive forces. Insofar as enlarged reproduction is concerned, it includes the reproduction of material goods as well as the reproduction of the labor force. In this respect, the education of staff and workers is an important aspect in socialist enlarged reproduction. In the past, we paid attention to the reproduction of material goods but did not pay enough attention to the physical strength of workers and to the training and improving of their intelligence, whereas the labor force is the most active factor in productive forces. Machinery and equipment are made by man and operated by man. We should closely combine the all-round training and improving of worker intelligence with the production of material goods, and place the development of production and the education of the staff and workers in equally important positions. Marx pointed out: "To change the character of common people so as to make them obtain skills and techniques in certain labor departments and become a developed and specialized labor force requires a certain education or training." ("Collected Works of Marx and Engels," Vol 23, p 195) In the past when we talked about expanding reproduction, what first came to mind was to increase the labor force, investments and equipment. Quite often we only thought of expanding reproduction by means of extension. We did not pay attention to enhancing the quality and efficiency of the workers. Nor did we pay attention to tapping the potential of enterprises, to their innovations and restructuring. According to statistics, 80 percent of the investment for tapping potential and for innovations and restructuring is used for the extension of enlarged reproduction, and only 20 percent is used for the renewal and technical innovations of fixed assets. China's original industrial foundation was weak, and it was necessary to first expand reproduction by means of extension. But in our current modernization program, we must fully utilize the present industrial foundation, lay stress on the technical innovations and the renewal of equipment of existing enterprises, on improving the management and technological process, and on raising the skills and techniques of the workers. We must continue to get deeply involved in production and enable enlarged reproduction to play the dominant role. Only in this way can we have higher quality with less investment and greater economic returns with lower consumption, and can the people's livelihood improve gradually.

Lenin once pointed out: "Communism means labor productivity which is higher than that of capitalism and which is created by the workers who use advanced technology, who are voluntary and who are united." ("Selected Works of Lenin," Vol 4, p 16) The raising of labor productivity is decided by various factors, of which the main one is "the average level of skills mastered by the workers, the level of scientific development and its technological use, the social combination of the production process, the scale and effect of the means of production and the natural conditions." ("Collected Works of Marx and Engels," Vol 23, p 53) Here Marx put "the average level of skills mastered by the workers" in first place. One important reason why China's present labor productivity is low is that the educational and technological level of the laborers is low. Therefore, if we want to raise labor productivity, we must strengthen the education of the staff and workers, raise their educational and technological level, and change latent productive forces into actual productive forces. Generally speaking, to master modern technology in production, the workers must have a middle-level specialized education. Viewed from technological requirements, the higher the educational level of the workers is, the higher the rate of production quotas will be and the more the constructive suggestions and creations and invention will be. Some industrially advanced countries like the United States, Japan and the Soviet Union regard the development of education as an important factor in economic growth. They energetically develop the educational cause along with developing the economy. They strengthen the training of staff and workers. In our country, some enterprises have also done a good job in educating staff and workers, and this has promoted the development of production. The Taiyuan Iron and Steel Company began to train all its personnel in 1978. In the past few years, because the educational, scientific and technological levels of staff and workers has been enhanced, the production of enterprises has rapidly taken on a new look and new records have been established in the eight economic and technological indexes. In 1979, it was cited as an advanced unit in the metallurgical industry. From experience they realized: "We cannot produce superior quality steel without first having acquired qualified personnel through training." Marx pointed out long ago that the technological level of the population is the prerequisite for the entire production and therefore is the main accumulation of wealth. This truth has been proved more and more in production practice. But some comrades have not fully understood the importance of the education of staff and workers; quite often they separate the education of staff and workers from the development of production and the economy, or they even make the two antagonistic. They fail to see the gravity of the situation in which the educational and technological level of our country's staff and workers is not in conformity with the requirements for modernization; therefore, they think that production can be developed without paying attention to the education of staff and workers. If this erroneous view is not corrected, it will inevitably exert a bad influence on production and construction and on the enhancement of the understanding of staff and workers.

II

Our party and government have always attached great importance to the education of staff and workers. They also have a fine tradition in educating staff and workers well. As early as the revolutionary war years, we carried out various forms of education and training for the cadres and for staff and workers by starting from the wartime conditions and the needs in struggle. Since the founding of new China, following the rehabilitation and development of the national economy, the party and government have issued instructions many times and paid great attention to the part-time education of staff and workers. Good results have been achieved. According to incomplete statistics, in the 17 years before the "Great Cultural Revolution," illiteracy was wiped out on a large scale. More than 2.9 million staff members and workers reached the level of 6 years of primary schooling, 960,000 finished part-time secondary schools and 200,000 graduated from part-time institutions of higher learning. In 1965, the number of persons who had studied in various staff and workers' part-time schools of various grades reached more than 17 million. This raised the educational and technological level of our country's staff and workers. Some of them became key leaders and fine specialized personnel on various fronts. They made important contributions to our socialist construction. But owing to the influence of the "leftist" ideology, particularly owing to the disruption caused by the 10 years of turmoil, the education of staff and workers suffered serious destruction. There has been a certain rehabilitation and development in recent years, but it has not attained the past level. It is still an arduous task to train all personnel and to establish a regular system of educating staff and workers. The organizations and institutions for the education of staff and workers have not been adequately perfected. The training targets, teaching plans (programs) and examination methods of various staff and worker schools are not adequately explicit and unified. Some specific policies and stipulations remain to be implemented and the conditions for running schools remain to be improved. These problems must be gradually solved.

We should understand that the obstacle to strengthening the education of staff and workers is that some leading comrades do not fully understand the important position and role of this education in the four modernizations. Therefore, they do not grasp the work firmly and are slack in their work and lack a sense of urgency. In modern construction, the results of science and technology are rapidly applied in production. New technology, new products and new equipment develop more and more rapidly. Production technology is constantly being innovated and new trades are constantly emerging. The progress of science and technology has given the education of staff and workers a new role and new content. The number of technical personnel in some industrially developed countries generally is more than 30 percent of the total number of staff members and workers. But the number of engineering technical personnel is only 3 percent of the total number of staff members and workers. We must wipe out the longstanding erroneous view that despises education, science and culture and that discriminates against intellectuals. We must energetically raise the position and role of the education of staff and workers in our modernization, adopt effective measures to strengthen the education of staff and workers, improve the quality of our country's staff and workers, and train a staff-worker contingent which has scientific and cultural knowledge and which has specialized techniques and management experience to suit the needs of the four modernizations.

Strengthening the education of staff and workers is an important part of realizing economic readjustment. Readjustment is an important measure that must be adopted for rationalizing the economic structure, and training is an important part of realizing this measure. We must give regular education in a planned way to large numbers of cadres, staff members and workers in order to raise their political, cultural, technological and management levels. In the readjustment period, we must readjust the proportional relationships between the education of staff and workers and the national economy, as well as the proportional relationships within the education itself. In the past, the plans for the educational cause and the plans for the national economy were seriously out of proportion. The funds for education only accounted for a very small percentage in the national economy, and the funds for the education of the staff and workers were even less. Based on the requirements of the party Central Committee, we must readjust the proportional relationships between the plans for economic construction and the plans for social development (the plans for developing education, science and technology, culture and public health) and appropriately increase the funds for education within the frame of the state's financial resources. We must understand that investment in education is a productive investment. This is an intelligent investment from which good economic returns can be obtained.

It is wrong to regard the investment in the education of staff and workers as merely a consumption investment.

The internal structure and proportional relationships of the staff and workers educational cause must also be readjusted. For instance, the higher education of staff and workers was once carried out blindly. Some units adopted the method of "saddling the horse after mounting." Many factories ran their part-time schools on the basis of one factory running one school and one school having one class. Through preliminary readjustment, the quality of teaching was improved, but some problems must be further studied and solved. The contents of the education of staff and workers are complicated, and they involve an extensive range of knowledge. In our practical work, we must pay attention to the readjustment and handling of the following relationships: starting from the practical conditions that the foundation of the education of staff and workers is weak, we must handle well the relationships between opening up roads for schooling, the forms of running schools, and the gradual establishment of a comparatively regular system for the education of staff and workers; we must handle well the relationships between the training of all personnel and the running of key classes, as those who receive education are large in numbers and the task is complicated; we must handle well the relationships between popularization and enhancement and between basic and specialized education, as the people undergoing education have different levels of culture and technical knowledge and are engaged in different vocations; and the staff and workers who attend part-time schools have to handle correctly the relationships between study and production (work). In short, through readjustment we must put the education of staff and workers into the plans for the national economy and the plans for the educational cause, and gradually regularize the education.

Strengthening the education of staff and workers is needed to change the structure of China's cadre contingent. In our modernization work, we should have a revolutionized and young cadre contingent which has specialized skills and knowledge. But of the 20 million cadres who are not engaged in production, only a few have a high level of educational and technical knowledge, and those who are in the prime of life and understand modern management are even fewer in number. If this situation is not changed, it will be very hard for them to lead the work of modernization. To solve this problem, we must, when supplementing the number of cadres, energetically strengthen the specialized training of the cadres we currently have, besides selecting cadres who have high political, educational and vocational levels. In particular, we must have long-range plans and carry out training of fine middle-aged and young cadres so that they can become specialized personnel who have both ability and political integrity.

The education of staff and workers must be carried out under the principle of "walking on two legs." On the one hand, full-time institutes of higher learning should train and provide personnel, and on the other hand, we should open up all possible roads for schooling and carry out all forms of training of employed cadres. Practice has proved that the education of staff and workers is one of the important methods for training construction personnel faster, better and with more economic results. At present, of the nearly

400,000 industrial and communications enterprises, about 50 percent have run various types of staff and worker schools or training courses. The number of participants is about 10 million. In 1980, the number of students studying in the staff and worker institutions of higher learning was about 500,000, half of the number of students studying in the full-time institutions of higher learning. Most of the graduates of the staff and worker institutions of higher learning are in charge of technical and management work in factories, mines and enterprises, and some of them have become key leading cadres. Take, for example, the Shenyang No 1 Machine Tool Plant. Sixty percent of the cadres at the factory level, 70 percent of the middle-level cadres, the general designer, the general art designer, the general accountant and some engineers and technicians were trained and brought up by the education of staff and workers.

Facts have proved that strengthening the education of staff and workers ia a strategic task in realizing the four modernizations as well as a task of top priority. Leading comrades at all levels must understand the importance and urgency of the education of staff and workers. The period for training personnel is long. There is an old Chinese saying: "It takes only 10 years to grow trees, but 100 years to rear people." This shows that the training of personnel and the building of socialist spiritual civilization is a long-term hard struggle. We must take a broad and long-term view, make overall plans, strengthen leadership, and really implement the task of developing intelligence and training personnel in every unit. If we grasp the education of staff and workers early, we will be in an active position, but if we grasp it late, we will be in a passive position. If we do not grasp it at all, it will be very hard for us to master advanced technology and equipment in order to build and manage well modern enterprises. It will be even harder to raise labor productivity by a large margin, and we will delay the great cause of four modernizations and commit historical mistakes.

III

The education of staff and workers is an important component part in building socialist spiritual civilization. In realizing its great historical mission of communism, the working class undertakes the double task of building a high level of material and spiritual civilization. Just as Comrade Mao Zedong said, we not only want to build a politically democratic and economically prosperous China, "but also want to change an ignorant and backward China because of old cultural domination into a civilized and advanced China which is under new cultural domination." ("Selected Works of Mao Zedong," Vol 2, p 624)

China has 100 million staff and workers. Their level of education, understanding of cultural and scientific knowledge, ideological values and morality are an important way of measuring the level of socialist spiritual civilization. How the education of staff and workers is carried out has a direct bearing on the great cause of building socialist spiritual civilization and on the great cause of whether socialist modernization will be successful. China's staff and worker contingent is essentially good. Especially in the recent years since the smashing of the "gang of four," this contingent has exerted itself spiritually, restored and developed the spirit of going all out, and progressed. The great majority of staff and workers are working in a down-to-earth manner for the realization of the four modernizations. But we must understand that because the 10 years of turmoil confused the people's ideology and confused ideological and political work, the education of staff and workers has been relaxed, the ideology of some staff members and workers is not healthy enough, and they have poor knowledge, low socialist consciousness and lack a sense of responsibility. They do not understand the glorious traditions of China's working class, do not understand the historical mission of the world proletariat. Through various forms we must strengthen propaganda and education on Marxist-Leninist basic theory, education on the history and glorious revolutionary traditions of the working class, and education on the historical mission of China's working class, and raise their socialist ideological consciousness to enable the staff and worker contingent to keep and develop the character and nature that the working class should have and to resist the corrosive influence of nonproletarian ideology; we must also instruct and educate the staff and workers to study hard scientific and cultural knowledge and to master technology so that they can become both Red and expert. Lenin pointed out: "Without knowledge, the workers will not be able to carry out self-defense; with knowledge, they will be powerful!" ("Collected Works of Lenin," Vol 2, p 68) China's working class, which is working hard for the realization of the four modernizations, must not only master the skills needed for carrying out the four modernizations, but also become the main force in building socialist spiritual civilization. They should foster the great ideals of communism, develop socialist new morals and new habits, and make contributions to building socialist spiritual civilization!

Summing up what has been mentioned above, strengthening the education of staff and workers is a great strategic task in realizing the four modernizations. At present, we must implement the principle of giving training to all personnel in the education of staff and workers, make full use of the economic readjustment, and make all-round plans and overall arrangements. In the coming few years, the vocational training of leading cadres and the making up of technological lessons for young staff members and workers who came to factories since the "Great Cultural Revolution" should be stressed in the education of staff and workers. We must energetically think of how to make a policy that is beneficial to the three initiatives of mobilizing the leading authorities to run schools, teachers to teach, and staff and workers to study hard. We must combine the study with the personal interests of staff and workers. We should gradually establish a regular system of giving training and examinations to the staff and workers and put their study records into the educational and technological files to be used as an important reference for upgrading, promoting and selecting advanced personnel. In this way we can create the conditions for reforming our labor system and cadre system. We must gradually improve the conditions for running schools, energetically build a teacher contingent and training bases for the education of the staff and workers, and gradually standardize the plans for training teachers. The staff and worker part-time schools at all levels must strengthen teaching management, build and perfect their rules and regulations, and constantly raise the quality of teaching.

Heavy responsibilities must be shouldered in the education of staff and workers. The education of staff and workers has good prospects. According to the requirements of the decisions made by the party Central Committee and the State Council on strengthening the education of staff and workers, we must unswervingly carry the education through ideologically, in a planned way, organizationally and with measures, and really strengthen the education of staff and workers. We must bring into full play the initiatives of the trades union, the CYL, the women's federation, and the scientific and technological association, work hard together, do a good job in the education of staff and workers, and make new contributions to the training of large numbers of qualified personnel needed for the four modernizations!

IT IS IMPERATIVE TO UPHOLD THE BASIC PRINCIPLES OF MARX' THEORY OF REPRODUCTION--PART ONE

Beijing RED FLAG in Chinese No 5, 1 Mar 82 pp 21-25

[Article by Deng Liqun [6772 0500 5028]]

> [Text] Editor's note: This article by Comrade Deng Liqun integrates historical experience with the current actual situation, expounds the basic principles of Marx' theory of reproduction, upholds the importance of these principles, and is helpful to the vast numbers of cadres in their study of and research on economic theory. The article consists of three parts. The first part expounds the idea that dividing social production into two major categories is an important premise of Marx' theory of reproduction. The second part expounds the idea that coordination between the two major categories is a basic condition for the normal progress of social reproduction. The third part expounds the idea that it is a general law governing expanded reproduction that priority must be given to producing the means of production. In this issue we publish the first part, and the other two parts will be published in the coming two issues.

Since the 3d Plenary Session of the 11th CCP Central Committee, in order to correctly sum up the experiences of our country's socialist construction and to enable our national economic readjustment to be smoothly carried out, a continuously increasing number of comrades have been consciously studying, or have been restudying, Marx' theory of reproduction. In 1980, to facilitate this study, the Research Office of the CCP Central Committee Secretariat organized several economic theorists to compile a book, entitled "Studying Marx' Theory of Reproduction," which contains excerpts from the principal contents of volume two of "Das Kapital." This book of excerpts is very difficult to understand. This was anticipated even when the book was being compiled. Therefore, the economic theorists were requested to write three easily understood articles which concisely sum up the book. Even with these articles, it is still difficult to study the theory. However, based on the requirements of practical economic work, it is not enough for the leading comrades at various levels who do economic work to study the book of excerpts alone. It is most desirable for them to study the whole of "Das Kapital," volume two, and also to strive to understand it thoroughly. The reason why this is necessary is very simple. An important reason for the numerous mistakes we committed in our economic work in the past was our lack of understanding of Marx' theory of reproduction. Some comrades say that advocating the study of Marx' theory of reproduction is an idea divorced from reality and that it is unnecessary to study this theory. We must not accept this view.

The overwhelming majority of those comrades who, over the past year and more, have conscientiously studied the theory of reproduction, feel that the study of this theory has greatly enhanced their ability to understand and solve problems, and that it is quite necessary to continue to organize this kind of study. However, a handful of comrades are skeptical about, or even object to, certain basic principles of Marx' theory of reproduction. In July of last year, at the graduation ceremony of the 10th enterprise management study class run by the State Economic Commission, I expressed disagreement with the view of this handful of comrades. I talked very briefly about this because of inadequate preparation and time limitation. I will now discuss the question in greater detail.

I. Dividing Social Production Into Two Major Categories Is an Important Premise of Marx' Theory of Reproduction

Superficially, social production is the sum total of the production activities of numerous enterprises. These enterprises are divided into various trades and sectors. Can we base our revelation of the laws governing social reproduction activities on a categorization according to trades and sectors? No, we cannot. According to the difference in the use values of various products, Marx divided the totality of social products into the means of production and the means of subsistence, and then divided social production into two major categories, namely, production of the means of production and production of the means of subsistence. It is to make possible the renewal of production that we must have both the means of production and the means of subsistence, and moreover, an appropriate ratio should be maintained between them. Only thus can the workers and capitalists of the two categories in capitalist society acquire the consumer goods needed for reproduction; only thus can the capitalists obtain the means of production needed for reproduction; and only thus can the reproduction of social capital be carried out. Therefore, the laws governing social reproduction activities are also the natural relationships between the two major sectors which produce these two categories of products.

Lenin highly appraised this categorization by Marx. He said: "The basic premises on which Marx' theory is based are the following two principles. First, in a capitalist country, the total product, like an individual product, is composed of the following three parts: 1) invariable capital; 2) variable capital; and 3) extra value.... The second principle is that capitalist production must be divided into two major categories. The first category is production of goods which are used for consumption in production and used as an input in production. These goods are not used for personal consumption, but are used for the consumption of capital. The second category is production of consumer goods, that is, goods used for personal consumption." ("Collected Works of Lenin," Vol 3, p 31; note that "extra value" is synonymous with surplus value) Please note that the division of production into the two major categories is not only one of the "basic premises" of the theory of reproduction, but is also in itself a principle of this theory. According to logic, a "premise" is a known judgment for inference. If this judgment is wrong, subsequent judgments and even the whole process of inference will certainly be invalid.

Before the emergence of Marxism, none of the economists, including the most outstanding ones, made a scientific categorization of the total social product, and hence of the overall social production. Therefore, they could not scientifically explain the process of social reproduction.

Francois Quesnay, the representative of the French school of physiocrats, had made an attempt in this respect and had put forth some original views. Marx said that the fruit of his attempt "is an extremely ingenious idea. Undoubtedly, it is the most ingenious idea which has hitherto been put forth in political economics." ("Collected Works of Marx and Engels," Vol 26, part I, p 366) In his "Tableau Economique," Quesnay described the exchange between the three classes: the farmowners whose land was one lease, the landowners, and the "unproductive classes" (capitalists and workers). However, as pointed out by some people, this exchange only amounted to an exchange between two sectors: agriculture and industry. Because of this method of categorization, his analysis of the reproduction of social capital encountered grave difficulties from the start. The economists after Quesnay, such as Adam Smith, even slipped back compared with Quesnay. Adam Smith not only failed to rectify the defect in Quesnay's analysis, but even excluded invariable capital from the value of commodities (the commodities constituting the annual social product). He held that the value of a commodity is made up of wages, profit and rent, or, in other words, can be split up into v + m. This made the path to understanding the process of social reproduction even less accessible.

By breaking through Quesnay's limitations and correcting Smith's mistake, Marx could build a scientific theory of reproduction which is applicable not only to the capitalist economy but also to other socioeconomic forms. The basic premises of Marx' theory of reproduction form an important part of his theory of reproduction. Any attempt to separate these premises from the theory of reproduction will inevitably lead to deviation from Marx' theory of reproduction. This is true of both the analysis of the reproduction of social capital and the analysis of socialist reproduction.

In exercising leadership over the Russian people in carrying out economic construction, Lenin analyzed the industrial structure by categorizing production into agriculture, light industry and heavy industry. He said in a speech: "To save Russia, it is not sufficient to rely on bumper harvests in agriculture alone, or to rely solely on a good situation in light industry which provides the peasants with consumer goods. We must also have our heavy industry." ("Collected Works of Lenin," Vol 33, p 385)

First of all, we should say that Lenin's method of categorization differs from Quesnay's method, because the distinction between light industry and heavy industry is based on differences in the use value of products, rather than on different sectors of production. Light industrial products are basically means of subsistence, and heavy industrial products are basically means of production. Therefore, the relationship between light industry and heavy industry is basically tantamount to the relationship between two categories: the production of the means of subsistence and the production of the means of production. As to agriculture, if production is not highly developed, the overwhelming majority of agricultural products can either be directly used for consumption or can be used for consumption after simple processing work. Thus, agriculture can basically be regarded as belonging to the second category. Therefore, we must not sweepingly say that it is incorrect to divide production into agriculture, light industry and heavy industry as a way of categorization.

Second, Lenin also said at that time that what was called heavy industrial production, such as mining and metallurgical production, should be called the production of the means of production in the terminology of political economics. (see "Collected Works of Lenin," Vol 33, p 369) Obviously, in Lenin's view, the categorization of production into agriculture, light industry and heavy industry was, after all, different from the categorization into the two major categories, and therefore heavy industrial production could not be substituted for the production of the means of production. If we say that in the past the relationship between agriculture, light industry and heavy industry basically reflected the relationship between the two major categories, then, in recent years, the gap between these two has been continuously widening. Considering the heavy industrial sector, at present not only can many products produced by enterprises belonging to the heavy industrial sector be directly used for personal consumption, but many heavy industrial enterprises are also producing various daily necessities. Many products from the light industrial sector are also means of production, such as fabrics, felt, leather products, ceramics, porcelainware, and enamelware, which are for industrial use. In particular, since the appearance of new industries such as the plastic materials and synthetic fibers industries, light industry and the textile industry have also served the metallurgical, mining, chemical, machine-building and electrical industries, and so on, by providing many new materials with special properties which are used to help complete the production processes. That is to say, heavy industry and light industry are merging with each other, and it is becoming increasingly difficult to distinctly separate them. As for agriculture, in today's developed capitalist countries, there are extremely few agricultural products which are directly used for consumption without undergoing industrial processing. In our country, the proportion of agricultural products used as industrial raw materials is becoming increasingly high. To sum up, the drawing of a distinction between agriculture, light industry and heavy industry has been increasingly substantially divorced from the use (that is, use value) of the products. This has actually been increasingly owing to the need to separately control various enterprises on the basis of different sectors. In these circumstances, if we continue to rigidly adhere to the drawing of this distinction, our economic work, in particular our planning and statistical work, will no longer be scientific.

In the past we believed that the two major categories of social production were not abstract and they specifically existed in each production sector. Thus the relationship between the two major categories has to be embodied in the relationship between agriculture, light industry and heavy industry. Actually, the relationship between the drawing of a distinction between the two major categories and the drawing of a distinction between agriculture, light industry and heavy industry is not a matter of one being abstract and the other being concrete; these are just different ways of categorizing the same thing, social production. The categories involved in these two ways of drawing a distinction have, as a rule, been derived through abstraction and summing up. When we draw a distinction between the production of the means of production and the production of the means of subsistence, we single out two different characteristics from the social products, and hence from social production, namely, being used for production and being used for consumption. Then we consider the production of all social products in terms of these characteristics. As to the drawing of a distinction between agriculture, light industry and heavy industry, as we have said, agricultural products include both the means of subsistence and the means of production. The same reasoning also applies to light industry and heavy industry. If the two major categories concretely exist and can be reflected in a concrete way, then their existence is reflected in all the products of the two major categories and the production of these products.

Does this then imply that the national economy cannot be divided into different sectors and cannot be studied on the basis of various sectors? No, it does not. It is quite necessary to divide the national economy into sectors and to study it on this basis. In fact, this kind of study is being carried out. For example, under the Academy of Social Sciences, there are an industrial economic research institute, an agricultural economic research institute, an economic research institute for finance, trade and material resources, and so on, which respectively study industry, agriculture, finance and trade, and so on. Some colleges also provide specialist courses to train specialist cadres for various economic sectors. However, these belong to the realm of sector economics. These studies constitute a task of sector economics, not of political economics. Therefore, categorization on the basis of sectors of production should not be taken as the premise for the theory of reproduction, which is an important part of political economics.

Neither does this imply that when we plan the industrial organizational structure and the composition of enterprises, it is not necessary to divide production into sectors under each category. Actually, in "Das Kapital," Marx said: "Each of these two categories embraces various sectors of production. All these sectors together form a single and large sector of production, one of which being the sector which produces the means of production, and the other being that which produces the means of subsistence." ("Collected Works of Marx and Engels," Vol 24, p 439) However, these sectors of production, divided according to the two major categories, differ in some ways from the sectors categorized as agriculture, light industry and heavy industry. According to the method of dividing production into two major categories, some of our enterprises might have to be readjusted, shifting from one sector to the other, and the sectors might also have to undergo changes. Some enterprises which produce both means of production and means of subsistence might change to being specialized in one category in the course of the development of cooperation between specialized enterprises. Some enterprises need not and cannot specialize in one category. They might be included in appropriate sectors according to the main use of their products. This change is actually a readjustment of the industrial organizational structure and the structure of enterprises, and is a very complicated matter. When we effect this readjustment, we must not only have specific plans for implementation, but must also be prepared to solve numerous practical problems. Therefore, we cannot effect this readjustment in isolation so that it is divorced from our national economic readjustment or the reform of our economic system.

Quite a few comrades disagree with the idea of adopting the so-called "classification of production into primary, secondary and tertiary industries" to substitute for or "supplement" the division of production into two major categories. This is not only because the theoretical basis of "classification into primary, secondary and tertiary industries" is a vulgar theory of value, but also because this classification itself is extremely confused. For example, the so-called "tertiary industry" generally includes public utilities such as transportation, communications, the power industry, coal gas production, water supply, warehousing and so on; such trades as commerce, financial business, insurance, entertainment, catering, tourism and so on; as well as scientific research, education, the press, radio and television, and even administrative, military and judicial organs, and so on. Some of these, such as transportation, belong to sectors of material production. However, the majority belong to sectors of nonmaterial production. As for administration, military activities, entertainment and so on, these cannot even be called economic sectors. Thus, this classification simply cannot reveal the laws governing social reproduction.

Since the founding of Marx' theory of reproduction, the world economy has undergone drastic changes, such as the appearance of the socialist economy and the formation and development of state monopoly capitalism. The relative importance of commerce, finance and business, transportation and communications, municipal public amenities, catering, service trades, tourism and so on in the national economy has greatly increased; and this should also be regarded as a change, which is, moreover, a very marked one. Let us look at the "service sector" (including transportation and communications, posts and telecommunications, commerce, banking and insurance, repair and maintenance of domestic buildings, family service trades, "social management businesses" undertaken by enterprises outside productive sectors, and so on) of several principal capitalist countries. The proportion of those employed in the "service sector," as a percentage of the total number of people employed, was: for the United States, 55 percent in 1952, 58 percent in 1960 and 62 percent in 1970; for the United Kingdom, 46 percent in 1952, 47 percent in 1960 and 50 percent in 1970; for West Germany, 33 percent in 1950, 37 percent in 1960 and 42 percent in 1970; for France, 35 percent in 1950, 39 percent in 1960 and 49 percent in 1970; and for Japan, 29 percent in 1950, 40 percent in 1960 and 47 percent in 1970.

Marx said: "If the quantity of products remains constant, the smaller a country's productive population as a proportion of its nonproductive population, the richer will be the country. This is because the relatively small size of its productive population is merely an indication of a relatively high labor productivity." ("Collected Works of Marx and Engels," Vol 26, part I, p 229) The level of development of our country's productive forces is low. The proportion of people engaged in commerce, services and so on should not and cannot be as high as in developed capitalist countries. However, with the development of production, the number of workers in these sectors should correspondingly increase and they should gradually constitute an increasingly higher percentage of the entire working population. However, this was not the case with our country in past years. Statistics have revealed the following changes in the percentages of workers in our country who belong to several specified sectors (under the ownership of the whole people).

The sectors are: (A) communications and transportation, posts and telecommunications; (B) commerce, catering and service trades; (C) municipal public utilities; and (D) scientific research, cultural services, education, medical and health services.

The percentages are:

	(A)	(B)	(C)	(D)
1949	8.0	15.7	0.4	14.7
1952	7.2	18.5	0.3	15.1
1957	6.8	19.9	0.9	13.4
1958	5.6	10.0	0.6	8.3
1965	6.6	14.7	1.2	14.3
1976	6.3	13.0	1.2	11.7
1978	6.0	13.0	1.3	12.6

The low percentages of workers in these sectors indicate that the development of these sectors has been quite incompatible with the development of the entire national economy. The consequences have inevitably been very undesirable. It is absolutely necessary to stress the development of these sectors. Actually, we have considered it an important task of national economic readjustment to end the relative backwardness of these sectors. After several years of efforts in this direction, marked results have been achieved. Of course, progress is still quite inadequate and we should continue to make efforts.

Is the relative backwardness of these sectors owing to not using the "method of dividing production into primary, secondary and tertiary industries" to substitute for or "supplement" the division of production into two major categories? Absolutely not. Everyone knows that although light industry is "included" in the two major categories, it has been a weak link in our national economy. Even transportation and communications, which is classified as a "tertiary industry," and which is also "included" in the two major categories as part of heavy industry, is also relatively backward. Thus, the problem is owing to some other reason. The objective reason for the relative backwardness of these sectors is that in old China the economy was quite underdeveloped and the broad masses of people lived a life of hardship, being inadequately fed and clothed. After the overthrow of the reactionary rule of imperialism, feudalism and bureaucrat-capitalism, and after the founding of the PRC, while we carried out the socialist transformation whereby the system of private ownership was replaced by public ownership, we devoted strenuous efforts to the restoration and development of industrial and agricultural production. This was absolutely correct. The reason is very simple. Considering the relationship between production and exchange, we know that only when many things are produced can exchange be expanded; only when people are adequately fed and clothed can we consider the satisfaction of other needs; and only when material production is well developed can there be favorable conditions for the development of science, education, medical and health services, art and so on. To sum up, as Marx said, the development of material production is the basis of overall social life and of the totality of real history. (Refer to "Collected Works of Marx and Engels," Vol 23, p 204) Our weak point is that we have not gradually and correspondingly developed these sectors with the gradual development of industrial and agricultural production. We have not adequately paid attention to the role of these sectors in promoting industrial and agricultural production. Our view is seriously one-sided.

Some people hold the view that, at the time when Marx wrote "Das Kapital," certain sectors which are called "tertiary industries" were not yet well developed and were not very important, and therefore Marx did not include them in the two major categories in his categorization of production. This view probably represents a misunderstanding of the structure of "Das Kapital." Volume two of "Das Kapital" studies the process of circulation of industrial capital, and the consideration of various specific forms of capital is absolutely unnecessary. To study various specific forms of capital is a task of volume three. The classification of production into two major categories only deals with industrial capital and not the entire national economy, or even the whole society with its cultural and political realms. Did Marx simply ignore commercial capital, financial capital and so on? In fact, in volume three of "Das Kapital," nearly 400 pages were devoted to the study of such capital. We should say that Marx paid great attention to it. The question is that when we divide production into two major categories in studying the reproduction of social capital, we must definitely not consider such capital, because it is not industrial capital. Marx paid great attention to the differences between various types of capital, saying: "The most ridiculous view is to regard merchant capital--whether it appears in the form of capital for the trading of commodities or capital for use in monetary business--as a special variety of industrial capital, just as mining, agriculture, animal husbandry, manufacturing industries, transportation and so on are, by virtue of social division of labor, branches of industrial capital, and hence specific realms for investment of industrial capital." ("Collected

Works of Marx and Engels," Vol 25, p 361) When we divide social production into two major categories in our study of social reproduction, if we also consider nonproductive or even noneconomic sectors, we will only make a mess of the problems to be studied and will be unable to find the laws governing social reproduction.

Of course, this does not imply that the development of commerce, the financial sector, service trades and so on need not be coordinated with the development of industrial and agricultural production, or imply that there is no need to maintain necessary proportional relationships between these sectors and industrial and agricultural production. Such relationships are necessary and it is very important to study them. However, they belong to the category of relationships between social production and other economic sectors, and do not belong to the category of relationships between different categories of social production.

HOW TO HELP CADRES STUDY THE THEORY OF REPRODUCTION

Beijing RED FLAG in Chinese No 5, 1 Mar 82 pp 26-28

[Article by Wang Jue [3769 3778] and Zang Zhifeng [5258 1807 7364]]

[Text] Since spring last year, the Party School of the CCP Central Committee has organized the sixth and seventh rotation training courses for senior and mid-level cadres to study the Marxist theory of production (with an outline from "Das Kapital," Vol 2, as the teaching material). Thanks to their efforts, these cadres have made fairly good achievements in their study. Based on teaching practice during this period, the following are our views on how to help cadres study the theory well.

1. Analyze the Cadres' Favorable Conditions To Help Them To Have Confidence in Their Study

In the past, these comrades studied very little of the Marxist theory of reproduction. Therefore, at the beginning of their study, they saw many difficulties and regarded the deep study of this theoretical book as unachievable and they were slightly terrified by the sight of the book. Therefore, first of all, it is necessary to help them to see in an overall way their favorable and unfavorable conditions in their study. That is to say, they must understand that there are difficulties in their study, but at the same time they must also understand that they have their own favorable conditions. Thus we can strengthen their confidence. According to our view, these comrades have the following three favorable factors in their study. First, they have rich practical experiences. Most of these cadres not only have experiences in revolutionary work and the management of political power but also in the socialist construction over the past 3 decades. It is true that many of them lack systematic thought with regard to these experiences and their understanding of the law of the movement of socialist economy is still vague, but their rich practical experiences are very useful in the study of economic theory. It is because the Marxist theory of reproduction is neither divorced from reality nor abstract, and because it is a theoretical generalization and summing up of the internal relations of objective economic movement, that it is applicable not only to capitalist socialized mass production but, with the exception of its capitalist nature, is also applicable to socialist socialized mass production. Therefore, it is not strange for them to study this. In particular, when their study is related to our experiences and lessons in economic construction, they are able to have a deeper understanding of Marxist theory. Second, they have a strong desire to study and they are highly aware in study. Most of the cadres took part in the study courses with various specific problems that they met in their work and in their minds, and they hoped to find answers to these problems through theoretical study. They also hoped to find a theoretical basis for the party's policies and principles. These comrades regarded "Das Kapital" as the fruit of Marx' 40 years of hard work and the invaluable theoretical wealth left by the revolutionary teacher for the working class. They said that as veteran party members and cadres, "it is good for us to read even the basic classical works of the revolutionary teacher." Consequently, they have a definite goal in the study of the theory of reproduction, they urgently felt a need for such theory and they are highly conscious in their study. Third, they have a certain cultural level and theoretical foundation. These comrades have taken part in revolutionary works for decades. Some of them had very little education before joining the revolution, but after joining the revolutionary ranks most of them have been able to reach the cultural level of senior secondary education through self-study or various short-term training courses. They have come to understand basic Marxist-Leninist principles, have a fairly high level of understanding of policies and a strong ability to analyze problems.

The above-mentioned favorable conditions are the cadres' internal foundation for studying well the Marxist theory of reproduction. To clearly point out these favorable conditions is helpful in mobilizing these cadres' initiative in the study. At the same time, we also fully estimated their difficulties in reading this book and consequently we gave them coaching to help them display their advantages and overcome difficulties and shortcomings.

2. Grasp Basic Principles Through Reading Original Works

In "Das Kapital," Vol 2, Marx systematically and scientifically analyzed the law of capitalist reproduction and this is one of his brilliant contributions. But this volume was compiled by Engels according to Marx' manuscript after the latter had passed away. Some theses are quite dispersed. The outline is aimed at concentrating these theses, but still it has the features of a manuscript and, in addition, it is a translated version. Consequently, these cadres are not used to reading such a book. Therefore, another important problem that has to be resolved is how to help them grasp the main points in the course of reading, grasp basic principles and spend less time on minor questions. For this purpose, we compiled a coaching program with the outline of "Das Kapital," Vol 2. This program does not explain the original work paragraph by paragraph, nor is it divorced from an explanation of the principles of the work. On the contrary, it is based on the original work. First of all, it summarizes the contents of each article into several basic principles and then it basically follows the sequence of ideas of the original work to explicitly explain each basic principle. The explanations include major contents, practical significance and answers to questions. The main task of this coaching program is to draw out the basic viewpoints of the original work, explain the difficulties that are found in the process of reading it, expound the realistic significance of principles and help the cadres to overcome obstacles in reading so that they will be able to grasp the core of the work from the point of combining theory with practice. Many comrades did not understand the book after their first reading, but when they read the book after reading the coaching program outline, they became more aware of the main points of the book. We also gave them coaching in class so that they would understand basic principles when they are listening or reading.

3. Correctly Understand the Method of Explaining Abstract Things in a Concrete Manner and Understand the Meanings of Symbols, Formulas and Concepts So As To Understand the Book

In the course of reading, the comrades find that, with the exception of a few sentences that are difficult to understand, they usually have the following two difficulties.

First, they are not accustomed to the Marxist method of explaining things by going from abstract to concrete forms. In our life, we usually come to know things by going from the concrete to the abstract. But when Marx was explaining the results of his theoretical study, he did so from the abstract to the concrete. Thus this method of explanation is contrary to our way of understanding things. Many comrades were not accustomed to this when they began their study and it seemed to them that Marx was explaining things in a roundabout way. Therefore, in the course of coaching, we explained to them that Marx used different methods in studying problems and explaining them. He did not just explain things repeatedly; he explained things from different aspects and used the method going from the abstract to the concrete. For example, the explanation of capital circulation in the first section is rather abstract and difficult to understand; the explanation of capital turnover in the second section is more concrete. The explanation of simple reproduction in the third section is relatively abstract but the analysis of expanded reproduction is more concrete. Of course, in order to understand and grasp the Marxist abstract method it is necessary to read it repeatedly and conscientiously think about it. We will be able to understand the Marxist method of analyzing things from the abstract to the concrete only when we are willing to really study hard. That is to say, we must first of all grasp the nature of things one link after another and go deeper and deeper so that we will be able to gradually approach reality and become invulnerable. The comrades said: "On the first reading we understand nothing; on the second reading we are a little bit enlightened; on the third reading we come to understand the value of the study." The training courses are very helpful for these comrades in improving their capacity for logical thinking and their theoretical ability, and in overcoming their one-sidedness of considering things as they stand. Consequently, they have become more interested in theoretical study.

Second, at first they did not understand the symbols, formulas and figures used in the Marxist theory of reproduction. This was because these comrades have a weak foundation in foreign languages and mathematics. Accordingly, in compiling coaching material or in carrying out teaching, we taught them the pronunciation of symbols written in foreign languages and their meanings.

In order to deal with symbols, we also guided them in combining Marx' literary analysis with the meaning of formulas. When some cadres came to understand the economic relations reflected by formulas, they no longer felt that these formulas were abstract and hard to understand. On the contrary, they found that Marx was able to summarize the complicated relations to scientifically and accurately reflect the law of the process of reproduction. Many comrades said that the understanding of principles is helpful for them in understanding the economic implications of formulas and figures, and with the understanding of formulas they are able to grasp the basic principles even more tightly. They said: "The formulas of reproduction are marvelous. When we are carrying out our work according to these formulas, our economy will be able to develop smoothly, but when they are violated the development of our economy cannot but meet with obstacles. Economic law is merciless." Many comrades made calculations using the 5-year expanded reproduction diagrams worked out by Marx. After making the calculations, they had a better understanding of the relations by which the two big categories condition each other in the process of expanding reproduction. They said that they will always remember "proportionate balance."

In order to help these cadres to understand the meaning of some concepts and spheres, we also held seminars in basic knowledge as an additional means of teaching some of the basic theories. Most comrades had never read volume two of "Das Kapital" and therefore in the course of reading, they could not understand some basic concepts and spheres that are already analyzed in volume one and, as a result, they had some difficulties in their study. Because training courses are given only for a short period, it has been impossible to teach systematically. Therefore, we introduced to them the spheres of commodities, currencies, capital and surplus value through the form of basic knowledge seminars. In this way, we are able to help these cadres, who had never studied basic knowledge, to master it while those who had studied were given the chance to study it again. The comrades said that such a method is imperative because it links the earlier with the later.

4. Combine Theory With Practice, Sum Up Experiences and Guide Work

Combining study with practice is a basic principle in the study of Marxist theory. First of all, we will be able to understand basic principles only when we are able to combine theoretical study with practice. In "Das Kapital," Vol 2, Marx expounded the general principles of social reproduction very freshly, profoundly and abstractly. If we divorce our study from reality, we will find it difficult to understand such principles. Once we link the study with our experiences we will understand them at once. The cadres said that when they read the book just for the sake of reading, they felt that they were isolated behind covered windows and could not see things clearly, but when they linked theoretical study with practice, it was as if they were opening the windows and they could see things clearly. They happily said that following their study of the book in regard to the theory of reproduction, they can clearly see the picture of the whole of socialized mass production. Thanks to the study, they have been able to understand such questions as the circulation and turnover in the economic activities of each enterprise, the movements of reproduction of the whole society that is formed by the interwoven turnover of enterprises and also the conditions that are needed for carrying out social reproduction smoothly. It is as if they are standing at the top of a mountain to view the panorama.

In addition, the purpose of studying theory is to use it while the process of combining the study with practice and summing up experiences is also the process of mastering and making use of theory. Therefore, when we were introducing some basic Marxist principles, we spared no efforts to combine this course with major experiences and lessons in our socialist construction so as to explain the realistic significance of these principles and guide the cadres in combining theory with practice. These comrades held that studying the Marxist theory of reproduction is of particular significance. In the past, many comrades knew the "how" of the experiences and lessons in our economic construction but did not know the "why." But this time, following their study, they have come to understand that the previous mistakes in the economic construction were caused by the violation of the general law of social reproduction expounded by Marx. As a result, they have a deeper understanding of the correctness of the party's line and principles that have been defined since the 3d Plenary Session of the 11th CCP Central Committee. They also found that the 10 principles for economic construction put forth by Comrade Zhao Ziyang in his report on government work accord with our national conditions and each has its own theoretical foundation. If we are able to follow this road, we will be able to carry out our socialist construction healthily and smoothly. This method of study, which is linked with reality, has made the cadres fully confident about the future. Many comrades said that the decision taken by the CCP Central Committee for mid-level cadres to study the Marxist theory of reproduction is of strategic significance in our party's ideological and theoretical construction in the new era.

QUESTION: WHAT IS MULTICHANNEL COMMODITY CIRCULATION AND WHY MUST WE PRACTICE IT, AND WHY IS STATE MONOPOLY OF GRAIN PURCHASE AND MARKETING A LONG-TERM POLICY?

Beijing RED FLAG in Chinese No 5, 1 Mar 82 pp 29-31

[Article in "Questions and Answers" column]

[Text] Question: What is multichannel commodity circulation and why must we practice it?

Answer by Wan Dianwu [5502 0368 2976]: Commodity circulation channels mean the routes, processes and links through which commodities pass from the producer to the consumer. In the 1950's when economic sectors with various types of ownership coexisted in our country, we practiced multichannel commodity circulation. But owing to interference from the "left," the state trade organs had a virtual monopoly in this field, namely, commodities circulating through virtually only one channel. This adversely affected the development of production and caused inconveniences to people in their daily lives. Since the 3d Plenary Session of the 11th CCP Central Committee, we have emancipated thought, adopted more liberal policies, learned lessons from our experience with the problems confronting our country in regard to commodity circulation channels, and gradually revived and developed commodity circulation through many channels.

At present, the many commodity circulation channels in our country can be classified in different ways. According to the developmental level of commodity exchange, they can be put into two classes, namely, direct circulation channels, which means that production and commercial distribution are carried out by the same entity (such as fair trade, commercial distribution by producers themselves and so on) and indirect circulation channels, which means the division of labor between production and commercial distribution by using trade organizations as the media for commodity circulation. According to how commodity circulation is administered, they can be divided into planned channels and channels not subject to central planning, the former referring to the channels through which commodities essential to the national economy and the people's livelihood circulate and the latter referring to the channels through which commodities not subject to central planning circulate. For example, three categories of industrial products which might be distributed by trade organs on a selective basis or by industrial enterprises themselves; three categories of agricultural sideline products, which might be transacted at negotiated prices, and so on. According to the nature of the commercial enterprises which handle commodity circulation, these channels can be divided into four groups, namely, state trade, collective trade, individual trade and joint venture trade. The multichannels which we often talk about are, in general, of the last kind.

Why must we practice multichannel commodity circulation? The main reasons are:

First, there is a great disequilibrium between the regions and departments of our country, the scale and degree of development of commodity production and commodity exchange being quite different. In order to adapt ourselves to this uneven development of productive forces, we must practice multichannel commodity circulation. In our country, where 80 percent of the population engages in agriculture, mainly by manual labor, the commodity rates of various agricultural products, native and special local products, and household sideline products vary greatly. Therefore, we need many channels for goods to circulate between urban and rural areas and for goods to be exchanged between peasants to satisfy each other's wants. If we were to rely on state trade organs and supply and marketing cooperatives alone for commercial distribution without providing peasants with thousands of trade fairs so that "sellers can find places to sell and buyers can find places to buy," we would seriously frustrate peasants from boosting diversified economic activities with enthusiasm. The same situation faces our industry, which has a large number of enterprises scattered over a vast area and has a large variety of products. The small enterprises, which make up a large proportion of our industry, especially require responsive and diverse channels for marketing their products and securing supplies of raw materials and other inputs. In the past, too many agricultural and industrial products were subject to state trade monopoly, which lacked flexibility. This adversely affected the development of production and the improvement of the people's life. Since the 3d Plenary Session of the 11th CCP Central Committee, the relative proportions of agriculture, heavy industry and light industry in our national economy have been becoming more and more rational, and the output of agricultural products and light industrial products has been growing gradually. At the same time the market has become more prosperous and stable, and the commodities subject to state trade monopoly or quotas have been diminishing. As regards the commercial distribution of agricultural products, there are the state trade monopoly, state purchase quotas and purchases at negotiated prices. As regards the commercial distribution of industrial products, the state has ceased to act as the sole agent. It has changed to unified purchases, unified marketing and unified allocation, planned purchases, purchases by orders and selective purchases. As a matter of fact, multichannel commodity circulation has substantially contributed to making the market brisk and to accelerating commodity exchange.

Second, in our industry, agriculture and trade, state ownership, collective ownership and private ownership coexist. The exchange relationships between economic sectors with different ownership systems and those between units under the same ownership system are multifold and complex. Under these circumstances, limiting commodity circulation channels to a trade monopoly by state-owned trade organs is far from satisfactory. Besides, having their own particular economic interests, industrial and commercial enterprises wish to enjoy a reasonable degree of autonomy in marketing products and purchasing raw materials and in other material inputs. If these activities are overcentralized, the enterprises will be frustrated in displaying enthusiasm and initiative. In order to redress this error, an experimental reform has been carried out in quite a number of state industrial and commercial enterprises in recent years. This has involved granting them greater autonomy. Industrial enterprises now have the power to sell their own products once they have fulfilled the state purchase plans. The commercial enterprises now have the powers to purchase goods on their own. Thus appropriate diverse channels are required for commodity circulation.

Third, there are thousands and thousands of different kinds of commodities, each of which has distinct features with regard to production and consumption. The production and commercial distribution of commodities vary according to whether they are industrial products or agricultural products (especially fresh and live products), big commodities or small commodities, commodities under centralized production and state allocation or under decentralized production and distribution, necessities of life such as grain and other major foodstuffs or consumer durables such as watches and television sets, and so on. Judging by the present capacity of our state trade organs with regard to their organization, management and administration levels, storage and transport facilities, only if we practice multichannel commodity circulation can we ensure that commodities can, in accordance with their peculiar properties and their production and distribution processes, pass from the producer to the consumer by the shortest routes, through a reasonably small number of links, within a shorter period of time and at the cheapest cost.

The experience of the past 3-odd years has proved that practicing multichannel commodity circulation has played a positive role and achieved remarkable results in enhancing the relationship between production and commercial distribution, boosting production, making the market brisk and abundant in goods, making life convenient for the masses, improving enterprise management and so on. Of course, since our administrative work has not been able to keep pace with the developments in commodity circulation because we have started using multichannel distribution and for some other reasons, there has been some confusion and problems in the market. However, from the overall view, "briskness" is the main feature while "confusion" is a phenomenon of secondary significance. Besides, practicing multichannel commodity circulation does not necessarily result in "confusion." The market can become "brisk without being in confusion," and more thriving and stable if the governments at all levels make a great effort to strengthen administration. At the same time they must make full use of taxation, interest rates, pricing and other economic levers as regulators and checks, and ensure that the state commercial enterprises play the leading role in commodity circulation.

Question: Why is state monopoly of grain purchase and marketing a long-term policy?

Answer by Liang Yan [2733 1693]: The policy of state monopoly of grain purchase and marketing comprises the planned purchase by the state of rural surplus grain and the planned supply by the state to the urban and rural population, who need grain. Practice has proved that this policy has played an important role in providing all the people in our country with conditions for a stable life, in stabilizing market prices and in ensuring socialist construction. Must we maintain the state monopoly of grain purchase and marketing now that the grain supply situation is better than before? The answer is yes. The reasons are:

First, although the situation in grain supply is better than before, grain supply is far from ample. The population of our country is 1 billion, and thus providing grain is a matter of top priority. Since new China was founded, grain output has substantially increased. Especially since the 3d Plenary Session of the 11th CCP Central Committee, owing to the adoption of more liberal rural economic policies as well as the implementation of various forms of the production responsibility system, the peasants' enthusiasm for work has been greatly aroused. As a result, not only have diversified economic activities developed remarkably, there has also been quite a big increase in grain output, and in the majority of our rural areas, an increase in grain consumption. However, the grain output per capita of our country still is at a very low level. In 1979, when the grain output, including grain for food, fodder, seeds and industrial use, reached an historical high of 664.2 billion jin, the output only amounted to 688 jin per capita, over 100 jin below the lowest level in the world, not to mention the developed countries. To a fairly large extent, our agriculture is subject to climatic changes and therefore the yields are not very stable. In good harvest years, the situation is not too bad, but in lean harvest years, a reduction in grain output will make the grain supply somewhat tight for all who need it.

The level of our country's agricultural output is not high and the commodity rate of grain is very low. At present, the grain purchased by the state by procurement and at negotiated prices only represents about 20 percent of the total annual grain output, and if we deduct the grain that the state sells back to the rural population, the commodity rate of grain is only about 15 percent. Yet this rate can hardly be raised quickly in the coming years. Because the rural population is growing, the peasants want more grain for food and other uses so as to raise their living standard moderately, and more grain has to be used as fodder so as to cope with the needs of developing livestock husbandry. On the other hand, with the proliferation of the urban population and with the development of industrial production, in particular, that of the foodstuff processing industry and other light industries, there will be a growing demand for grain by towns and industries. Moreover, with the diversification of rural economic activities, that grain supplied by the state to teams engaging in cultivating industrial crops, exploiting forests, raising livestock, and working in the salt and fishery industries has greatly increased and more grain has to be sold to reward the sale of agricultural sideline products to the state. In this connection, taking live pigs as an example, the state now has to earmark 10 billion jin per annum for this purpose, an increase of 60 percent over that of 1978. These are the reasons why the demand for commodity grain in our country has been growing year after year. Therefore, the contradiction between the supply of and demand for commodity grain is still fairly sharp in our country, and a certain amount of grain still has to be imported every year.

Since grain output per capita is not high, determining how much of the annual grain output is to be left with the peasants and how much is to be purchased by the state is a very important policy issue. Handling the matter properly will contribute to consolidating and strengthening the alliance of peasants and workers and to building socialism. Otherwise, it will probably be detrimental to the interests of peasants, or will affect grain supply to urban, industrial, mining and industrial crop growing areas. Practice has proved that only if we firmly maintain the state monopoly of grain purchase and marketing, resorting to state planned purchase and state planned supply (or state supply quotas), will we be able to distribute grain according to a correct ratio between the amount of grain subject to state purchase and the amount to be retained by peasants, and thus ensure that everyone in our country has enough grain to eat.

Second, being a socialist country, we must stick to the principle of developing the national economy according to plan while using market regulators as auxiliary instruments. Although the production responsibility system has been implemented in rural areas in various forms, the rural economy remains a collective economy based on public ownership of land and other basic means of production. Therefore, it must be subject to the guidelines and restraints of state planning with regard to both production and distribution. Among the necessities of life, grain is an item of utmost and vital importance to both the rural and the urban population. Therefore, it must be distributed mainly according to plan. Particularly because the contradiction between the supply of and demand for grain is fairly sharp, the policy of state monopoly of grain purchase and marketing must be pursued with determination. If the production and consumption of grain were entirely regulated by market forces, peasants would, under the influence of the law of value, grow more crops which would bring in more money. As a result, agriculture would fall into a state of blind development and anarchy, ceasing to be a secure source of grain supply for the state and affecting the normal supply of grain to the urban population as well as to that part of the rural population which does not have sufficient grain. Besides, grain prices would fluctuate constantly in accordance with the supply and demand relationships, falling to a level unbearable to peasants in years of good harvest and soaring in years of lean harvest. This would run counter to the interests of both the grain consumers in urban and rural areas and the peasants who grow grain. Fluctuating grain prices would destabilize the prices of other foodstuffs. The workers in our country are receiving quite low wages. Quite a large percentage of their wages is spent in buying grain and other foodstuffs. Under these circumstances, if grain prices were unstable, the urban population could hardly lead a stable life and the life of the peasants who do not have enough grain would also be adversely affected. Finally, if grain prices were not stable, the market prices of other commodities would be unlikely to be stable and it would be hard to realize a socialist planned economy. Therefore, whether the policy of state monopoly of grain purchase and marketing should be pursued is an important issue which concerns socialist economic construction, and the stability and unity of our country. Instead of being an expedient, state monopoly of grain purchase and marketing is a long-term policy which must be pursued with determination.

INDUSTRIAL ENTERPRISES SHOULD BE RECTIFIED IN A COMPREHENSIVE MANNER

Beijing RED FLAG in Chinese No 5, 1 Mar 82 pp 32-36

[Article by contributing commentator]

[Text]

I

The CCP Central Committee and the State Council have decided to carry out rectification of all state-run industrial enterprises in a planned, systematic and all-round manner by stages and groups in the next 2 to 3 years. This decision is extremely timely, and it has great significance for better implementing the party's policy of readjusting, restructuring, reorganizing and upgrading the national economy, fully bringing the potential of existing state-run enterprises into play, improving economic results, promoting a fundamental turn for the better in the condition of our national economy and accelerating the development of socialist modernization.

Since the smashing of the "gang of four," industrial enterprises have already carried out many rectifications. Why are we bringing up the question of rectification again at present? This is because although the impressive results obtained from the rectifications of the past have played a promotional role in production, progress in the work of rectifying the enterprises is unbalanced. Only a handful of enterprises have been properly rectified. Most of the enterprises are still in an intermediate state and some have not conscientiously carried out rectification. In these enterprises, management is chaotic and serious problems exist. Even among the enterprises in which rectification has been carried out better, not all the tasks have been done solidly, and relative to the demands of modern socialist enterprise management the gap is still very wide. We must see that such phenomena as weakness and laxity in leading bodies, weak ideological and political work, flabbiness, overstaffing, slack labor discipline, poor product quality, serious waste and poor economic results exist in varying degrees at present in many of the enterprises. Because of the impurity of their leading bodies, a handful of enterprises have been corroded by capitalist ideas. They have shown unhealthy tendencies, violated financial discipline and engaged in such illegal activities as fraud, tax evasion, retention of profits which ought to be turned over to the state, embezzlement and corruption and graft. Unless these problems are solved, it is impossible to strive for a fundamental turn for the better in the condition of the national economy, and it is even more impossible to really build our enterprises into modern socialist enterprises. Therefore, state-run industrial enterprises must continue to carry out rectification on the basis of the rectifications already carried out.

This rectification is different in character from the rectifications of the past. The rectifications of the past were mainly centered on bringing order out of chaos in various aspects of ideology, theory, policy and organization and correcting the things turned upside down by the "gang of four" in various tasks of the enterprises, removing the bad people who had worked their way into the leading bodies and restoring normal production order and management systems in the enterprises. Therefore, this kind of rectification is different. This kind of rectification is carried out under the condition of the unremitting deepening of the readjustment of the national economy, the continued progress in the restructuring of the economic management system and the steady development already obtained in the national economy. This rectification requires us to mutually integrate the series of tasks centering on readjustment, which was proposed at the 3d Plenary Session of the 11th CCP Central Committee. These tasks include expanding the decisionmaking power of the enterprises, implementing the economic responsibility system, promoting the reorganization and amalgamation of enterprises, establishing and perfecting the factory director responsibility system and the workers' congress system under the leadership of the whole party, improving and strengthening party leadership, strengthening ideological and political work and carrying out rotational technical and vocational training. It also requires us to tackle these tasks in a comprehensive manner based on the specific condition of various enterprises and on the order of importance and urgency. At the same time, it requires us to carry out an all-round rectification of the leading bodies, staff and workers' contingent, management system, labor discipline, financial discipline, party work style and ideological and political work. By means of the rectification, the leading bodies of various enterprises will be strengthened, production and technical management will be established on a solid foundation, various rules and regulations will be harmoniously coordinated, and problems in the implementation of the responsibility system will be properly solved. This will enable the management and administration work of the enterprises to reach a new level and there will be a notable improvement in economic results. This is therefore a comprehensive tackling of the problems of the enterprises.

II

In this all-round rectification, we must carry out building of the enterprises. What is the objective of the building? This objective has been put forward by the CCP Central Committee and the State Council: We must gradually build the enterprises into modern socialist enterprises with a high degree of material civilization and spiritual civilization and with distinctive Chinese features. To achieve this, all enterprises must make a success of the "three-builds" and fulfill the "six-good demands." The "three-builds" means to gradually build not only a democratic but also a centralized leadership system, to gradually build a Red and expert staff and workers' contingent and to gradually build a set of scientific and civilized management systems by means of the all-round rectification. By means of the "three builds," the "six-good demands" will enable the enterprises to correctly handle the economic relations between the state, the enterprise and the individual workers, outstandingly fulfill the targets of the state, attain good in taking into consideration the interests of the state, the enterprise and the individual workers, good in product quality, good in economic results, good in labor discipline, good in civilized production and good in political work, and become "six-good enterprises."

Gradually Build Not Only a Democratic But Also a Centralized Leadership System. This is determined by the nature of socialist enterprises. Socialist state-run industrial enterprises are enterprises owned by the whole people. All means of production belong to the whole people and the workers are the masters of the enterprises. The establishment of a leadership system in enterprises under the leadership of the party, giving full play to democracy and exercising centralized and unified command on a democratic basis, can fully reflect the superiority of the socialist enterprises. By means of rectifying the enterprises, we must build an efficient party committee good at unifying all the workers of the enterprises and at implementing the policies and principles of the party as well as the laws and regulations of the state. We must set up a unified system of command over production techniques and business management headed by the factory director. We must perfect the workers' congress system so that all the workers can genuinely exercise the right of running their own affairs. We must gradually bring about the revolutionization of factory-level cadres, lower their age and make them professionally proficient and knowledgeable. The posts of party committee secretaries should be held by party members with strong party spirit and good work style. They must be resolute and good at implementing the line, policies and principles of the party. They must possess a certain knowledge of production and management. They must be able to form close ties with the masses and to handle work in an all-round manner. The posts of factory directors (managers) must be held by comrades who can adhere to the four basic principles of the party, understand production techniques and relevant economic laws and who are good at management and administration. They must be honest and upright, good at forming ties with the masses, in good health and equal to the strenuous demand of leadership work.

Gradually Build a Red and Expert Staff and Workers' Contingent. The staff and workers of an enterprise are the masters of the enterprise. They are the mainstay for building socialist economy. This requires a staff and workers' contingent with high consciousness, fine technical know-how, strict discipline and good work style. Our working class has a fine revolutionary tradition under the leadership of the party. It has always been an outstanding contingent, imbued with creativity, which strongly loves the motherland and socialism and which is industrious and courageous. However, because of the sabotage of the "Great Cultural Revolution" over the years, this fine tradition has been greatly damaged and its cultural and technical level has generally fallen. We must carry out training and raise standards in a planned manner by means of the readjustment and construction. In the present readjustment, we must pay special attention to solving the following problems:

First, readjust labor organizations. The enterprise must organize production based on fixed personnel and quotas and resolutely overcome the phenomenon of overstaffing and sloppy work. The readjustment of labor organization must be carried out together with the setting up of personal responsibility systems. On the basis of raising the ideological consciousness of the workers, we must define the responsibility of every production post and work post, stipulate the quality and quantity standard for the personnel assigned in accordance with the demand for production skill and vocational work and gradually succeed in assigning qualified people according to a strict standard. We must try to make the best use of people so that everybody will do his best. The enterprise must readjust labor organization and management organs based on fixed staff and quotas. As for some of the surplus personnel, apart from arranging rotational training we can use some of them in strengthening social service organs and some can join labor service organs to open up and develop new avenues of production.

Second, carry out the training of all personnel in a planned manner. Carry out rotational training for the staff and workers by stages and in groups in a planned manner and keep on raising their ideological and political level as well as technical and vocational level. This must be a long-term and consistent system. In the future, all workers who newly enter a factory or who change their type of work must receive training and pass a test before they can take up their work. Major enterprises must set up training centers for their workers. Small and medium-sized enterprises which have difficulty in setting up training centers of their own may do so jointly or let the higher-level department concerned set them up on a unified basis.

Third, conscientiously readjust and strengthen labor discipline. Modern mass production cannot exist without strict discipline. We must energetically strengthen ideological education over the masses of workers and establish the habit of consciously observing labor discipline. We must set up a strict reward and punishment system. Workers whose labor attitude is good and who obey rules and regulations and do exceedingly well in their work must be commended and rewarded. As for those who have seriously violated labor discipline, the enterprise has the right to take economic or administrative action against them according to the measures provided. Those who refuse to mend their ways despite repeated warnings will be strictly dealt with and will even be asked to leave or be discharged. Practice has proved that the "workers' code of conduct" drawn up by the enterprise is an effective measure for educating the workers and strengthening labor discipline. The enterprise must also draw up an appropriate reward and punishment system in accordance with the demand of the "code" to ensure the implementation of the "code."

Fourth, conscientiously strengthen ideological and political education over the masses of workers. Apart from carrying out education on upholding the four basic principles and situations of a routine nature, the enterprise must also carry out patriotic education. By means of systematic political study, we must enable the broad masses of workers to understand clearly the distinction between socialism and capitalism and recognize the superiority of the socialist system. We must enable them to understand clearly the distinction between socialist enterprise management and capitalist enterprise management, recognize how to correctly handle the relations between the state, the enterprise and the individual worker, and become a qualified and exemplary socialist worker. We must pay particular attention to strengthening education over the young workers and raise the political quality of the staff and workers' contingent.

Gradually Build a Set of Scientific and Civilized Management Systems. At present, we must build the following four systems: 1) We must build an all-round planned management system aimed at fulfilling the state plan and satisfying the needs of society as much as possible. Planning work must be implemented in various departments and posts of the enterprise covering the entire process from planning to production and from selling to followup service. All personnel must strictly carry out production and work according to plan. 2) We must build an all-round quality control system aimed at developing new products and improving product quality. Whether or not the products will be suited to the market and whether or not products are of sufficiently high quality to satisfy the demand of the consumers are the principal hallmarks of the quality of enterprise management. All departments and personnel of the enterprise must really establish the concept of quality comes first and must always pay attention to quality throughout the process of production management. 3) We must build an all-round economic auditing system aimed at improving economic results and increasing the economic income of the state and the enterprise. 4) We must build a set of all-round personnel and labor management systems aimed at fully mobilizing the enthusiasm of the masses of workers. We must combine the training, assessment, promotion and selection of personnel to encourage the enterprising spirit of every worker and keep on improving the quality of the staff and workers' contingent. In order to achieve the above-mentioned objectives, we must also further perfect the fundamental work of enterprise management, perfect the primitive recording and calculating work and strengthen quota management work. We must set up and strengthen the responsibility systems at various levels and in various tasks. We must draw up various work procedures in the enterprise so that production techniques and various work procedures can be based on objective laws and can be carried out harmoniously and consistently. We must perfect the financial management system, strictly implement financial discipline, carry out work in accordance with the state financial system and put an end to waste. We must perfect the civilized production system.

Making a success of the "three-builds" and fulfilling the "six-good demands" will require a certain amount of time and the carrying out of a series of painstaking tasks. "A thousand-li journey is begun by taking the first step." What should we mainly grasp at the present stage in the all-round rectification of the enterprises? In his "Report on the Work of the Government" delivered at the Fourth Session of the Fifth National People's Congress, Comrade Zhao Ziyang stressed: 1) Strengthen and perfect the system of economic responsibility, improve the operations and management of enterprises and do a good job in overall planning, quality control and economic accounting. 2) Reorganize work units, arrange production according to a fixed number of workers and fixed quotas, systematically train all workers and staff and firmly overcome overstaffing and laxity in work. 3) Strengthen work discipline and strictly enforce regulations concerning rewards and disciplinary sanctions. 4) Strengthen financial discipline, improve financial rules and regulations and tighten financial control. To carry out the above tasks, special efforts must be made to reorganize the leading bodies by putting an end to laxity, flabbiness, overstaffing, and retaining people who are too old. At the same time, young and middle-aged cadres and technical personnel must be promoted to leading posts.

Proceeding from promoting and perfecting the economic management system is an important link in the present rectification of enterprises. Promoting the economic responsibility system is an extension as well as a development of the restructuring of such responsibility systems as expanding the decision-making power of enterprises made 2 years ago. The focus of expanding the decisionmaking power of enterprises is on solving the problems in economic relations between the state and the enterprise and arousing the enthusiasm of the enterprise. The purpose of carrying out of economic responsibility is to change the situation of egalitarianism with everybody "eating from the same big pot," so that the people will consciously concern themselves with the fruits of labor and thus solve the problem of properly arousing the enthusiasm of the workers in the enterprise. The industrial economic responsibility system is for integrating the economic interests of the enterprise and workers with the economic results realized from assuming economic responsibility, and fully arousing their enthusiasm so that they will exert themselves to make a success of production and business management and achieve the best economic results with a proprietary attitude. Some of the comrades have regarded the responsibility system as a matter of distribution of interests. This is incorrect. The economic responsibility system is an integration of responsibility and rights. The enterprise must first be responsible to the state. It must, in accordance with the demand of the state plan and the needs of the market, produce goods which are reasonably priced, attractive and readily marketable to satisfy the needs of society. For the sake of ensuring that the enterprise will fulfill its obligations, the state has given the enterprise certain power so that it can independently and effectively organize production, lower consumption, cut costs and improve economic results. The economic income created by the enterprise must first be used to make contributions to the state. Under the premise of increasing the income of the state, the enterprise may retain a bit more and distribute a bit more to the workers. Some of the enterprises have one-sidedly concentrated on profit without taking into consideration the demands of the plan and without paying attention to the interests of the state and the needs of society. They have blindly gone in for the production of highly profitable goods which are already in excessive supply, lowered product quality and even resorted to improper means to make higher profits. This method is extremely wrong and must be firmly corrected.

In rectifying the enterprises by proceeding from improving and perfecting the economic responsibility system, we must conscientiously solve the following three problems: 1) Integrate the implementation of the economic responsibility system with planned management. We must instruct the cadres and workers to establish the concept of planning, planned production and production based on the needs of society, and oppose clashing with the state plan as a result of unilateral pursuit of profit. 2) Integrate the implementation of the economic responsibility system with business management and make responsibilities and interests known to every worker. In this way, we will have a new motive force for encouraging everyone to improve business management, carry out technical transformation, raise quality, increase product variety and cut costs, and will not seek higher profit by improper means. 3) The income of the individual worker must be reasonable. At present the production level of our country is still very low and there is a serious shortage of investment funds. If the income of the individual worker is too high, not only can the supply of consumer goods not be guaranteed, but the state will also have no money to carry out construction. If production cannot go forward, the improvement of livelihood also cannot be guaranteed. Comrade Chen Yun said: We must eat and we must build. We must pay attention to these two things. If these three problems can be properly solved, they will contribute to the correct handling of the relations between the state, the enterprise and the individual worker, further tap the potentialities of existing enterprises, raise economic results and greatly benefit the country and the people.

III

This all-round rectification of enterprises involves various aspects of enterprise management, all the staff and workers of the enterprise, their spiritual features and management concepts as well as the task of restructuring the economic management system and readjusting the economy. Therefore, its scope and depth far exceeds the rectifications of the past. In order to carry out this readjustment smoothly, we must strengthen leadership, properly carry out all-round planning, link up the points and the areas and give guidance in different categories.

The work of the all-round rectification of enterprises is extremely important and arduous. The whole party must take this seriously and mobilize the masses. Party committees, people's governments and responsible departments at various levels must conscientiously instruct, supervise and help the enterprises to carry out rectification. First, they must carry out proper planning so that the approximately 2,000 hardcore cadres of enterprises throughout the country can conscientiously fulfill the task of rectification by stages and in groups within 2 to 3 years. Secondly, they must promptly sum up and exchange experiences in the work of rectification so that it will develop in a healthy manner. Furthermore, they must inspect and carefully check over those enterprises which have been rectified and help the backward units to make a success of rectification. It is necessary to properly coordinate the rectification carried out by the enterprises themselves with the instruction, inspection and approval of the higher-level departments.

To link the work at the points with that of the areas, it is necessary to first make a success of rectifying the points. The enterprises listed as key points for carrying out rectification are mostly backbone enterprises which have an important bearing on the national economy and the people's livelihood. Their output value and taxable profits turned over to the higher authorities occupy an important position in the country. Making a success of the rectification of these enterprises plays a very important role in stimulating our economy and increasing accumulation for the country. The purpose of grasping the points is on the one hand to make a success of the rectification of key enterprises, and on the other hand to create experiences for directing work in other areas.

In order to make a success of the rectification of enterprises, economic leadership departments at various levels must assign responsible cadres as well as provide the necessary professional cadres and party and mass organization cadres familiar with production, technology, business management, wage system and financial accounting, organize them into investigation teams for selected spots and send them to the backbone enterprises by stages. In turn these cadres must conduct investigations and studies, provide necessary guidance, help solve problems and promptly sum up experiences to direct rectification work in other areas under the unified leadership of their respective local party committees and people's governments. In other areas, it is mainly necessary to arouse all the workers of the enterprises, conscientiously study the guidelines of the relevant instructions of the Central Committee, fully bring their initiative and enthusiasm into play in the rectification work and consciously carry out rectification in accordance with the demand of the Central Committee.

Regardless of whether rectifying the points for the other areas, it is necessary to rely on all the staff and workers to carry out rectification under the leadership of the party organization of the enterprise. The party committee of an enterprise is the basic-level organization of the party in the enterprise and its core of political leadership. In the all-round rectification of enterprises, the party committee of the enterprise has an unshirkable duty as a pacesetter and must shoulder the responsibility of leadership. In some of the enterprises, the party committees themselves may have this or that kind of problem, but this should not be used as an excuse to prevent them from leading the rectification of the enterprise. They should carry out a self-revolution and consciously set an example. They should be determined to remold themselves, purify party spirit and correct party work style in the rectification, build the party committee into a strong and militant basic-level organization in line with the demand of the Central Committee and lead the broad masses of workers of their own enterprise to make a success of the work of rectifying the enterprise.

When carrying out rectification, all enterprises must proceed by mobilizing the masses and carry out political and ideological education of the broad masses of staff and workers in accordance with the guidelines of "report on the question of learning from Daqing in industry," a circular of the party group of the State Economic Commission transmitted by the CCP Central Committee. In this way they will clearly understand the fine quality, glorious tradition and great historical mission of the Chinese working class, consciously uphold the four basic principles, implement the policies and principles of the party, correctly handle the relations between the state, the enterprise and the individual worker, and actively take part in and properly carry out the work of consolidating the enterprise with a proprietary attitude.

At the same time, it is also necessary to direct the broad masses of staff and workers to develop campaigns for emulating, learning from and overtaking the advanced and helping the less advanced and for creating "six-good enterprises." Socialist emulation campaigns are an important method for arousing the broad masses of staff and workers to give full play to their wisdom and ability in building socialism, as well as an important means for encouraging them to learn from and help one another, overcome their shortcomings by learning from the strong points of others and raise their standards both in production and business management. Dialectical materialism informs us that the development of objective things is always unbalanced and contradictions between the backward and the advanced objectively exist. The development of campaigns for emulating, learning from, overtaking and helping will keep on exposing contradictions, discover potential, encourage mutual help and promotion and enable the backward to catch up with the advanced and the advanced to become more advanced. In the rectification of enterprises, the development of emulating, learning from, overtaking and helping activities aimed at creating "six-good enterprises" will focus the enthusiasm and wisdom of the masses on the basic demands of enterprise rectification and thereby expedite its penetrating development.

This all-round rectification of enterprises is a profound change. After all-round rectification, the enterprises must change the backward state of business management and establish an enterprise business management system with distinctive Chinese features in keeping with the demand of modernization. The principal hallmark for measuring the success of enterprise rectification depends on the quality of products, the volume of output, the level of economic results and the amount of contribution to the state. To fulfill this arduous task, there must be active participation from the broad masses of staff and workers on a conscious and voluntary basis. The basic policy of our party is: Wholeheartedly rely on the workers to run the enterprise properly. We must mobilize the broad masses of staff and workers to change their own backward features and to struggle toward the great goal of making a success of the "three-builds," attaining the "six-good demands" and building a socialist modern enterprise with a high degree of material civilization and spiritual civilization and with distinctive Chinese features.

CORRECTLY HANDLE THE QUESTION OF MARRIAGE AND FAMILY

Beijing RED FLAG in Chinese No 5, 1 Mar 82 pp 37-39

[Ideological commentary by Wang Chunyuan [3769 2504 0337] and Chen Zheguang [7115 0772 0342]]

[Text] The happiness of every household and the personal benefits of people from all walks of life hinge on marriage and family, which affect the prosperity of the nation and the state. All along, our party and state have attached great importance to marriage and family. Under the new historical conditions of strengthening China and of marching toward the four modernizations, there is great significance in correctly handling questions concerning marriage and family.

In the wake of the victory in socialist revolution and the development of socialist constructions, the family in the present state is basically different from that in the old society. But it is still the cell of our society. As the basic unit of people's life, the family still shoulders various social responsibilities. Therefore, whether the question of family and marriage is properly handled has a direct effect on the social development of our state. It is hard to imagine that a vigorous, happy and harmonious family cannot be found in an energetic and happy socialist society. In our state and society, the family is not something insignificant, as some people believe, and can be weakened and destroyed at will. On the contrary, it is a social entity that must be consolidated and developed. We strongly oppose the idea of placing the benefits of a small family above those of the state and the idea of upholding tenaciously the feudal family. For instance, when a person gets to the top, his whole family gets there with him, or in order to get some benefits for the family, the person will cultivate somebody and get in by the back door, or even make use of his position and power to gain personal benefits. This improper social atmosphere, which is related to the old traditional family concept, has seriously damaged the party's morale and the people's customs, as well as corroded the body of the socialist family. We advocate a complete rupture from such a concept of the family, which is incompatible with socialism. We advocate serving the people and we advocate socialism and communist thought. However, this is not done to weaken the family in a socialist state but to consolidate and develop a socialist family. Practice has fully proven that the establishment of the socialist ownership system in our state and the continuous eradication of the old traditional family concept have not weakened the family. On the contrary, the socialist family relationship has generally been built up and improved. It is foreseeable that the victory and progress of socialist modernization will bring to the socialist family profound changes--not dilution, but an overall enhancement and great improvement of its quality. The crisis of family disintegration in developed capitalist countries is not an inevitable outcome of the scientific and technological revolution, but the result of the disease of capitalism and the malignant devastating effects of selfish utilitarianism. The spiritual culture and material construction of our socialist state are basically different from those of the capitalist countries. They will bring the family in our socialist state to the perfect conditions predicted by Marxism.

The family exists in society. It is interwoven with and closely related to the state. Social troubles will trigger family discord, which in turn will disturb the tranquility of the society. Therefore, family harmony and unity is beneficial to social stability and unity. Family harmony and happiness is a requirement of the four modernizations. A happy family is where people rest happily, where they conserve their strength and store up their energy to fight new battles. It is where they can study quietly and acquire new technical ability for the cause of modernization, where they consolidate their confidence and determination to proceed forward with support and encouragement from their family members. It is very difficult for a person to wholeheartedly participate in modernization if he is in a chaotic and awkward family situation. The responsibility for nurturing a new socialist generation rests upon the family as well as on the society. The family is the cradle of education, and parents are the first teachers of their children. The intimate relationship between parents and children makes family education vital to the healthy development of children, adolescents and youths. Facts show that 8 or 9 out of 10 youngsters who go astray have had inadequate family education. Giving good education to one's children not only fulfills a family's responsibility to the state and the society but also plays an important part in solving the social problem of juvenile delinquency.

We must fully recognize the social significance of the marital relationship before we can correctly handle questions concerning family and marriage. Marriage is not only an important event in an adult's life, it is also an action with comprehensive and profound social content. When a couple gets married, they have obligations to each other as well as to their children. These obligations are more important compared to others in a modern society. Lenin once said, "Love involves the lives of two people and creates a third new life. As a result, love has a bearing on the society and produces a social responsibility." (Taken from K. Zetkin: "Impressions of Lenin," p 70)

The marital relationship affects the personal benefits of the husband and the wife. It also has a direct effect on the benefits of other family members and the society. When a couple gets married, they are held responsible for the legal and moral obligations to each other, to the parents of both sides and to their children. To think that marriage is only a personal affair, or to set love against responsibility, matrimony against obligations, or to pursue so-called "pure love," which is irresponsible, undemanding and immoral, is actually a reflection of the pernicious influence of the decadent "sexual emancipation" or "sexual freedom" of the bourgeoisie. This is incompatible with the concept of socialist love and marriage. Every citizen should resist and oppose the propagation and development of this ideology, which spoils the socialist marriage and family relationship and poisons the common practice of society.

Freedom of marriage is the sacred right of every citizen and it should be protected by law. The socialist system has, moreover, provided the conditions for this freedom. However, under the influence of the old way of thinking and customs, the freedom of marriage is interfered with, and arranged, forced as well as mercenary marriages and illegal practices are prevalent. We should protect in real earnest the legal rights of the married couple by fighting persistently against such illegal practices. But such freedom does not mean that one can be irresponsible to others or to the society. Neither can he play fast and loose, or go beyond legal and moral ties. Under the socialist system, freedom of marriage must be built on the foundation of a common ideal, and a couple must assume the same obligations to each other and to society. Intelligence and devotion to one's work play the most important part in choosing husbands and wives. Judging people solely by their appearance without giving heed to aspirations and virtues, or even establishing love on the basis of money and power, is by no means a free marriage. Young people with high aspirations and ambitions should treasure freedom of marriage and make proper use of it. They should not yield to the temptation of money, material things and power, and pander to the mercenary marriage in a disguised form. They must not be defeated by the unhealthy trend of capitalist liberalization. They should not adopt a cynical and imprudent attitude toward love and marriage.

We should not take marriage as the end of love but rather as a continuation or intensification of love and a starting point for further development. As partners in life and comrades in work, husbands and wives have deep affection for each other and a very intimate relationship which should be diligently cultivated and nurtured. In this respect, the principle of "mutual respect, mutual care, mutual trust, mutual encouragement, mutual help, mutual concession, mutual understanding and mutual consolation" between husband and wife advocated and practiced by the late Premier Zhou Enlai and his wife, Comrade Deng Yingchao, is exemplary and worth following. If both husband and wife follow this principle persistently, not being chauvinistic, overweening, or self-interested and overlooking the partner, their tree of love will flourish and they will live happily together forever.

Life, of course, is very complicated. Conflicts are sometimes unavoidable even between very harmonious husbands and wives. Whenever discord arises, both sides must remain cool. No one should be so impatient as to provoke the other party and aggravate the situation, much less lightly propose divorce, which would end the marriage, break up the family and deprive the children of their parents' care and education. This is an important question concerning the benefits of both sides as well as children and society. According to the provisions of Chinese marital law, no divorce will be granted by the court merely at the request of either party. Divorce will be granted or rejected only after the judicial court has clarified the facts, ascertained the rights and wrongs, and ruled that the relationship between the husband and the wife has been broken. The aim of exercising the freedom of divorce is to enable husbands and wives who no longer have affection for each other and who can no longer continue to live together, to end legally a marriage which exists only in name, to rid both parties of pain and reestablish another happy matrimonial family life. It is certainly not to grant legal sanctions to those who are fickle and abandon their spouse and children and spoil the happiness of other families. Therefore, anyone who has a family must take divorce seriously. One has to learn the proper ways to handle marital and family discords, to promote one's love of his or her spouse and develop a happy family.

Since the relationship between marriage and family is a very special one, which is most intimate, tender and delicate, people must correctly handle it by conscientiously observing the law as well as abiding by the moral code. Marital morals are a set of principles which are formed by personal precept and social norms, and a married couple must follow them. The characteristics of marital morals in a socialist state are freedom of marriage, monogamy, equality of the sexes, protection of the legitimate rights of women, children and the aged, and the implementation of family planning. They also ensure that family members respect, love and help one another and are of one heart and one mind. These are the supreme forms of marital morals in the social history of human beings to date. This set of marital morals is in harmony with the socialist marital law except that it is not mandatory but is more demanding than the marital law. Conscientiously handling the relationship between marriage and family with socialist moral standards of marriage is the quintessence of the construction of our socialist spiritual civilization. It is also an important factor for the construction of our material civilization.

At present, socialist marital morals are prevalent in China. However, the feudal marital system--unequal status of men and women, arranged marriage, being well-matched--still exists in China and is still seriously poisoning people's ideas and controlling the behavior of certain people. Furthermore, our state has been a semicolonial and semifeudal society for more than a century. Under the influence of the capitalist style of living imported through the open-door policy, capitalist marital morals of being money-oriented, philandering and harming others to benefit oneself have eroded people's minds and have become the dogma of some people. Such practices should be restrained by correct laws and should also be corrected by justified social opinion. We must make use of these two weapons of law and public opinion to create a healthy atmosphere of abiding by socialist marital morals. At present, anyone who exercises illegal practices in marriage must be punished so as to serve as a warning to others. At the same time, people of high socialist morals should be publicized and immoral practices must be severely criticized. Socialist marital morals should be persistently and distinctively promoted. Socialist marital morals cannot tolerate setting the wretchedness of capitalist marital morals against feudal marital morals, or vice versa. Every citizen in our socialist state must understand that the practice of harming others to benefit oneself, being fickle in affection, wrecking another family as a third party, ill-treating or abandoning children and the aged, and seeking happiness at the expense of the troubles of other people are all contradictory to socialist marital morals. Abandoning one's spouse owing to a change in position and conditions is by no means permitted in a socialist society. Are we going to tolerate the legal existence of a modern Chen Shimei who disowns his wife? A person who is immoral in marriage can never be strong in politics. A person who heartlessly abandons his family for his own interests will never really love his people or the cause of our party. All communists, the party's leading cadres in particular, should take the lead in abiding by socialist marital morals and in enforcing marital law. They should not arrange their children's marriage and should not be extravagant in marriage. They should not do anything that goes against socialist marital morals. They should promote the party's style in this respect and initiate the well-being of social practices. Under the direction of the party, the women's federation, the CYL, trade unions, cultural organizations and the educational department have paid attention to leading people to comply with socialist marital morals. Persistence in following such morals would open up new prospects for all families in the whole nation and the whole state living happily and harmoniously. The happy families throughout the country will form a strong base for socialist construction.

A DEMOCRATIC WORK SPIRIT SHOULD BE ENCOURAGED--NOTES ON READING VOLUME ONE OF 'SELECTED WORKS OF LIU SHAOQI'

Beijing RED FLAG in Chinese No 5, 1 Mar 82 pp 40-43

[Article by Yao Liwen [1202 0500 2429], Zheng Weizhang [6774 0251 4545] and Zhou Zhixing [0719 1807 5281]]

[Text] "We must expand party democracy," "We must encourage a democratic work spirit." ("Selected Works of Liu Shaoqi," Vol 1, p 66; henceforth only page numbers will be given) This was what Comrade Liu Shaoqi advocated in his report at the White area party representatives' meeting in May 1937. At that time, Japanese imperialism was pressing forward with its plan of destroying China, and the various races and various levels of people in our country were facing the calamity of national subjugation. Our party was at the historical juncture of mobilizing millions of people to engage in nationwide armed resistance to the invaders. Comrade Liu Shaoqi's advocacy of these measures at this crucial moment fully illustrated the importance and urgency of the problem.

At the time, the White area party organ was confronted with two possible changes. One was to shift the center of work to the establishment of an anti-Japanese national united front; the other was to free the party members and cadres from the influence of leftist doctrinairism and convert them to self-consciously implementing the party Central Committee's correct line under the leadership of Comrade Mao Zedong. The latter change was rather penetrating and difficult. Wang Ming's leftist doctrinairism had for a prolonged period of time dominated our party. Inside the party, democratic life had not been normal while the initiative and creativeness of the extensive masses of party members had been restrained. As a result, even a full year after the Zunyi conference certain cadres working in the White area still harbored the leftist erroneous ideas of closed-doorism and adventurism such as "down with everything, absolute noncooperation and struggle to the end against everything." It was realized that if our party failed to rapidly break away from the shackles of "these vicious traditions," or to quickly rectify the party's tendencies, it would be impossible to effect the former change and lead the people of the whole country to victory in the anti-Japanese national salvation struggle. For this reason, Comrade Shaoqi wrote a series of articles exposing and criticizing the leftist closed-door doctrine and adventurism as well as "extremely undemocratic practices." In these articles, he advocated the following idea: We must expand democracy within the party and encourage a democratic work spirit, and we must carry out, among the party members and cadres, education on democracy and the study and cultivation of democracy. Subsequently, he continued to expound this theme in other publications such as "On the Cultivation of Communist Party Members," "On Struggles Within the Party," "Overcome Difficulties, Prepare for Counterattack, and Create Conditions for the Postwar Establishment of a New China," "On the Party," and so on.

The historical experiences of success and failure have taught us that under the logical premise of a correct line and policy, the expansion of democracy inside the party, the encouragement of the democratic work spirit, the mobilization of the whole party's enthusiasm, and the building of correct relations between the party and the masses constitute important assurances for the realization of the party's general task and the promotion of the smooth development of revolutionary enterprises. Today, we are in the midst of a new era of all-round construction of socialist modernization. We are confronted with the problem of overcoming the vicious practices of subjectivism and bureaucratism in actual work, which results from the influence of the prolonged leftist errors, and also the problem of freeing ourselves from being divorced from the masses. We can derive much enlightenment from seriously studying Comrade Shaoqi's expositions and from historical lessons.

I

What constitutes a democratic work spirit? It is the execution of certain democratic procedures without being attached to formalism. More importantly, it implies that a democratic spirit be instilled in the life of the party and in all the work of the party. Comrade Shaoqi pointed out that leadership organs should respect each and every comrade's ideas and inherent rights. They should foster the spirit of criticism on the part of the cadres and make them brave enough to speak out. The leadership personnel should consider themselves ordinary comrades, treat others with an attitude of equality, modestly accept criticisms from below, and refrain from exercising special rights. Party organs should absorb and accept the experiences and good ideas of the whole body of comrades. They should, on the basis of democracy, establish the party's collective leadership. They should strengthen education and increase the party members' self-consciousness in obeying the organization, obeying the majority, and observing discipline. They must remove commandism and the doctrine of punishment. This is the democratic work spirit. Each and every one of our cadres must harbor such a spirit and employ it in reforming himself and educating the comrades. Conversely, people without the democratic work spirit are inclined to make arbitrary and peremptory decisions. They suppress democracy and even indulge in individual despotism. Naturally, they divorce themselves from the masses and from reality, and they are unable to formulate correct guidelines and policies. The leftist doctrinairist Wang Ming was precisely this type of person. He completely disregarded organizations and the masses and placed himself above everybody. He subjectively analyzed the state of the revolutionary struggle and mouthed empty, exaggerated and unrealistic slogans, guidelines and policies, forced the masses into adventurism, and made the party's work sink into the mire of blindness and recklessness. Under the influence of Wang Ming's errors, some comrades treated the party's resolutions with an air of bureaucratism and disdain and behaved in a despotic manner before their subordinates. They only wanted their subordinates' blind confidence and blind obedience. They refused to listen to their subordinates' ideas and would not help them to solve the real problems encountered in work. They only knew how to prepare reports, issue directives, and reprove and reprimand their subordinates. "After being subjected to the abuse and maltreatment by these people who indulge in empty talk, comrades who originally had been very lively and active have become people without a soul and without a future." (p 42) Such leftist closed-doorism and adventurism seriously endangered the work of the party and masses in the White areas. They provided the major obstacle to changing the pivotal center of the work of the party. In Comrade Shaoqi's opinion: "If we do not eradicate and change this type of 'empty talk-ism' our party's organization and work cannot be enlivened or developed." (p 41)

Whether one has a democratic work spirit depends in the last analysis on whether he has a world outlook. Comrade Shaoqi's advocacy of the democratic work spirit and his earnest practice of what he advocated were inseparable from his proletarian world outlook. He insisted on adopting the viewpoint of historical materialism and emphasized the need for cultivating a correct relationship between the individual and the masses. As Comrade Shaoqi saw it, history is created by the masses. Without the masses exerting their efforts, nothing can be successfully accomplished. The cause of communism is a cause of millions of people. An individual can perform only one part of the work. Regardless of how high the social status of an individual, he is but a "drop in the ocean." He must therefore firmly rely on the masses. Communist Party members should not, and cannot, be "heroes" representing the masses in fighting for the world. What they can do is to act as leaders in arousing the self-awareness of the masses, guiding and organizing them in their struggles. One might be a great personage, but he still has this set role. "If anyone endeavors to play a bigger role than this, then this can give rise to all sorts of errors." (p 352)

Some comrades frequently consider themselves wise and brilliant and "higher" than other people. They treat the masses with a bureaucratic attitude. They "stand above the people and not amidst them; they take themselves as the people's bosses and not as their workers. They act outside their authority, monopolize everything, and fail to observe their obligation to democratically cooperate with people outside the party; they take themselves as the rulers of the people and not the public servants of the people; and they do not listen to the people's orders or abide by their wishes." (pp 225-226) This kind of comrade makes no effort to arm himself with historical materialism and does not entertain any thought of believing in the masses, respecting them, or learning from them. How then can they possess a democratic work spirit? Comrades in leadership posts should refrain from following their example.

Comrade Shaoqi further pointed out: "A true democratic spirit is inseparable from the communist virtue of unselfishness." (p 67) Only in possessing the consciousness and unselfish spirit of a communist can we set to rights our relations with comrades and treat them with a democratic attitude. Within the revolutionary ranks, there exist only differences in duties and in the division of work. There does not exist any relative superiority or inferiority. We must treat our comrades with an attitude of equality and sincerity. We must place ourselves in the same position as our comrades and share their thoughts. We should feel concerned for each other and help each other. Those in higher ranks should encourage their subordinates to express views contrary to their own opinions or plans. With their subordinates, they should, wherever possible, resort less to the method of giving instructions or orders and more to the methods of making suggestions and instigating discussions. (pp 42-43) Without communist virtue and cultivation, this can hardly be done. People imbued with selfish and self-centered thoughts "wish to put themselves above other people and disdain being below others; they demand special rights to control other people and not to be controlled by others; they may at all times criticize, attack and insult other people, but other people may not criticize them; they want others to obey their 'decisions,' but they themselves can disobey the decisions of the organization; in their opinion, other people who break the principle of centralization are violating discipline, but they refuse to admit that their breach of the democratic principles is also in violation of discipline; they seek only their own individual development and even harm other people's development just for the sake of their own development." (p 67) These are innerparty reflections of the thoughts of the exploiting class of the old society and run counter to the democratic spirit.

II

In fostering the democratic work spirit, there must be a definite system to ensure its protection. In his report on the revision of the party constitution at the party's seventh national congress, Comrade Shaoqi made the following elucidation: "Our party is a united body formed by the party head (center), party organs at various levels and the extensive masses of party members which combine in accordance with definite regulations. These regulations constitute the party's democratic centralized system." (p 358) The implementation of democratic centralism organizationally protects the expansion of democracy within the party and the fostering of a democratic work spirit. As early as 1926, when talking about the organization and establishment of trade unions, Comrade Shaoqi pointed out that in democratic centralism, "there must definitely be the centralization of democracy" and that centralization does not mean "centralization in the individuals," but centralization in the resolutions passed by a majority vote at meetings. In 1945, he again made the following lucid explanation: "Only by implementing a high degree of democracy, can we reach a high degree of centralization of the leadership; and only under a high-degree centralized leadership which is based on democracy, can there be a high degree of democracy." (p 366) Some comrades only want centralization and not democracy. The centralization even develops to the point where arbitrary decisions are made and peremptory actions are taken, actions are taken according to the wishes of one individual, and individual despotism grows. This is tantamount not only to trampling democracy underfoot but also to violating centralization. As a measure of retaliation against this tendency toward individual despotism, the party might even evolve an extreme form of democratization. This violates democratic centralism from another angle. This shows the two extreme phenomena in inner-party life. As Comrade Shaoqi pointed out: "Both of these tendencies are erroneous. They greatly impede and violate the real unification and unity of the party. The party must be alert to prevent the appearance of such phenomena." (p 361) Actual practice has demonstrated that whenever our party insists on the adoption of democratic centralism, life inside the party is active and lively. The vast masses of party members and cadres are high-spirited and vigorous, and the revolutionary cause thrives and prospers. Conversely, whenever democratic centralism is neglected, life within the party becomes low-spirited. It makes some leadership personnel become proud and arrogant and divorced from the masses. It might even bring about the phenomenon of the individual putting himself above the party organization and cause the revolutionary cause to suffer a serious setback. The history of our party has recorded deep and painful experiences and lessons of this nature.

Moreover, Comrade Shaoqi emphasized the importance of instituting a system to protect the democratic rights of the people and thereby to systematize democracy. He said: "To promote democracy, we must set up a democratic system to facilitate supervision by the masses and to ensure that the masses have many opportunities and can employ various ways and means to oppose bureaucratism." (p 387) Whether the masses can exercise supervision hinges on whether our party can retain its character of being the vanguard of the proletariat class; the lack of a sound democratic system might directly affect the capability of the people's masses to supervise our party well. Some comrades within the party have been able to make arbitrary decisions and to take peremptory actions. They have disregarded the wishes of the comrades and of the masses, damaged the enthusiasm of the comrades, and even attacked and retaliated against those comrades who dared to express contrary views. All this can be ascribed, in addition to the fact that the ideologies of the exploiting class have been playing havoc in their minds, to the fundamental reason that the democratic system was not sound enough and was only an impediment to the masses in doing their supervisory work. In Comrade Shaoqi's opinion, those people who have trampled democracy underfoot should be dealt with by law. In 1942, when the anti-Japanese war was at a difficult stage, Comrade Shaoqi, aiming at establishing a strong anti-Japanese democratic base area, paid great attention to the setting up of an "order of democratic political life." He called on our comrades to fully equip themselves with the democratic spirit by learning to be democratic, practicing democracy at the various levels of the populace, and summarizing the experiences of various localities in carrying out democratic ideals so that they could educate the party members and the populace. He said: "We should further formulate certain laws on democracy," and "fix regulations on how to punish officials who have gone against democratic ideals and have infringed on civil rights (people's democratic rights). Inside the party, we should criticize, struggle against and punish party members who oppose democracy."

(pp 226-227) In his opinion, only by stepping up the studies and cultivation of and training in democracy and by protecting the healthy democratic system, can we really foster the democratic work spirit.

III

In promoting the democratic work spirit, we must insist on criticism and self-criticism. Criticism and self-criticism constitute both the substance of expanding inner-party democracy and the democratic work spirit, and powerful weapons for expanding inner-party democracy and promoting the democratic work spirit. Comrade Shaoqi said: "The central link in expanding inner-party democracy hinges on arousing criticism and self-criticism among the party members and cadres." (p 363) In order to smoothly carry out criticism and self-criticism, it is extremely important that leadership comrades at various levels set themselves up as examples. Comrade Shaoqi further pointed out: "Responsible persons in the various leadership organs must first carry out full self-criticism of the defects and errors in the work under their own leadership." "They must harbor the spirit of being fully prepared to accept other people's criticism." (p 364) Only in this way can democracy inside the party be fostered, and only in this way can we create the democratic atmosphere of daring to speak, not fearing to make errors, not fearing but welcoming criticism, and enjoying a free hand in our work. This atmosphere is precisely the requisite condition for arousing the whole party's enthusiasm and creativeness. Conversely, in cases where the spirit of criticism and self-criticism is lacking, where endeavors are made to cover up or hide one's defects and errors, where there is a failure to "feel glad upon being told of our faults," and where taunting replies are made and opportunities to retaliate sought, inner-party democracy is nonexistent, and far less is the democratic work spirit present.

In carrying out criticism and self-criticism, the democratic spirit must be shown and reasonableness must be firmly insisted upon. It is not a proper attitude by which to treat our comrades if we solely rely on questionable tactics and brutal force and subject party members to crude struggles and punishment. This, in fact, violates the principles of democracy. Against such undemocratic errors, Comrade Shaoqi pointed out: "Inside the party, everything must be governed by reason. Everything must be explained clearly by reason; and there must be a reason for everything." "In order to clearly explain the reason and to be able to explain clearly the reason, inner-party democracy is indispensable. It is absolutely necessary to practice sitting calmly together and thrashing matters out." (p 216) Only by insisting on reason can we make good use of the weapon of criticism and self-criticism and achieve the goal of educating the comrades and unifying the whole party.

In conducting criticism and self-criticism, we must insist on being practical and realistic and must be imbued with revolutionary courage. Comrade Shaoqi believed that there is no perfect leader in the world, neither in the past nor at present, and neither in China nor abroad. Nobody should be afraid of having committed errors. What we should be afraid of is the inability to discover and rectify errors. We must rectify our errors with the highest degree of revolutionary bravery. Such evil practices as "concern for saving face" and "fear of criticism" must be eradicated. "If you have done bad deeds, why be concerned with face-saving?" (p 312) Comrade Shaoqi not only was brave in discovering and rectifying errors but also encouraged comrades of the whole party to study and bring up problems. In a conversation with some reporters from north China, he pointed out: "You are at liberty to examine whether the party policies are correct or not. If you discover errors in the policies, you are perfectly at liberty to point them out. You have the right to do so." (p 403)

In his article "On Cultivation of Communist Party Members," Comrade Shaoqi pointed out that a real Communist Party member possesses the highest revolutionary courage. "Because he has no selfish motives, he has nothing to hide. He does nothing 'against his conscience.' He can openly reveal his own errors and defects and is brave in rectifying them. They are like solar eclipses and lunar eclipses which occur on and off." (p 132) Comrade Shaoqi was just this type of Communist Party member. He was a good model of being brave in criticism and self-criticism and of insisting on the democratic work spirit. In 1948, the revolutionary situation in the whole country was rapidly developing and victory was in sight. As one of the responsible persons of the party Central Committee, he reminded himself and his comrades to constantly be alert and to refrain from considering themselves as being always correct. He said: "We might be sitting placidly here, but danger is lurking. Have we done anything wrong? We should always ask ourselves this question." (p 399) Comrade Shaoqi never concealed his errors. In the spring of 1947, Comrades Mao Zedong, Zhou Enlai and Ren Bishi remained behind in northern Shaanxi to direct the war of liberation, while Comrades Liu Shaoqi and Zhu De were stationed in north China. In his capacity as secretary of the Central Work Committee, he took charge of the work entrusted to it by the party Central Committee. Under the guidance of Comrade Shaoqi, the various liberated areas undertook the mighty land reform movement and achieved important results. This helped to greatly strengthen both our party and our armed forces and ensured a victorious outcome of the people's war of liberation. Unfortunately, during the course of the work, certain "leftist" errors occurred. Comrade Shaoqi did not evade responsibility. He courageously admitted the errors and strove hard to rectify them. At the 2d Plenary Session of the 2d CCP Central Committee, he solemnly made a self-criticism and said: "In the course of the land reform, the various localities have made certain errors. The party Central Committee was responsible. In large measure I myself was connected with some of the errors." (p 419) This demonstrated the magnanimity and democratic spirit of a Communist Party member.

After studying these dissertations in "Liu Shaoqi's Selected Works," volume one, and giving much thought to our party's history, particularly the experiences and lessons on problems of democracy within the party since the founding of the PRC, we deeply feel that for the sake of strengthening the building of socialist material civilization and socialist spiritual civilization, party organs at various levels and each and every party member should carry on the party's superior traditions, foster the democratic work spirit, and earnestly practice what one advocates, forever and ever!

LITERARY AND ART CRITICISM IS THE SCIENCE WHICH MAKES LITERATURE AND ART FLOURISH

Beijing RED FLAG in Chinese No 5, 1 Mar 82 pp 44-48

[Article by Qu Xing [7257 7534]]

[Text] Our party fully affirms the achievements gained on the literary and art front during the past few years, including the achievements scored in the area of literary and art criticism. Since the smashing of the "gang of four," particularly since the 3d Plenary Session of the 11th CCP Central Committee, literary and art criticism has played a positive role in bringing order out of chaos in the struggle to oppose the "two whatevers" and rectify the mistakes caused by leftist thinking in literary and art circles, and has helped to promote a flourishing of literary and art creation and to open up new paths for revolutionary realism in literature and art. It is the achievements that are most important. However, during this recent period, literary and art criticism has been unable to keep pace with changes in form and has lagged behind the development of literary and art creation. In the face of an ideological tide that threatened to violate the four basic principles, it appeared weak and feeble and its attacks on the pernicious influences of "leftist" thinking lacked force. As regards some works, both good and bad, there was an absence of forceful Marxist analysis and criticism. The situation has changed greatly since last summer, and the renewed emphasis on criticism and self-criticism, including literary and art criticism, has aroused the interest and enthusiasm of both the literary and art circles and the whole party. Comrade Hu Qiaomu, in his speech entitled "Several Questions on the Ideological Front," pointed out that "if criticism in any area is to effectively achieve the goal of upholding the four basic principles, it must be correct both in terms of theory and reality and must be carried out in a regular and consistent manner." The question now is how can we make literary and art criticism advance in a regular fashion along the Marxist path so that literary and art criticism keeps pace with literary and art creation.

I

If literary and art creation is to be carried out in a regular and effective manner, it is essential that we further clarify the aim of such criticism. Looking back on and discussing the history of the past few decades of art and literary criticism does not seem to be a particularly difficult or superfluous task. Last year a few comrades in literary and art circles were worried that literary and art criticism might damage the hard-earned flourishing nature of the current literary situation. It must be said that there is no need for such general doubts. Only when literary and art criticism is erroneous will this kind of worry ever become reality. Correct literary and art criticism, on the other hand, can only help the overall development of a flourishing and prosperous social situation. Having already summed up positive and negative experiences, our party can now remove all forms of obstruction so as to ensure that literary and art criticism is carried out correctly on the basis of the four basic principles. However, it should also be noted that there are historical reasons for the phenomenon of people having many lingering fears. Since the founding of the PRC, literary and art criticism has played a very positive role, resulting in many fine achievements in the assessment of new works, the cultivation of new artists and writers, and other things. However, it cannot be denied that under the guidance of "leftist" thinking, literary and art criticism often developed into movements of criticism, with comrades being treated like enemies and fragrant flowers being seen as poisonous weeds. During the 10 years of internal disorder, literary and art criticism became an instrument to destroy literature and art, to persecute artists and writers and to exercise "overall dictatorship." The "gang of four" had ulterior motives and their "literary and art criticism," which excelled in "galloping over tender seedlings," directly served their policy of cultural destruction. The historical lesson that should be drawn from this is that the expansion of class struggle in the past influenced the aim and task of literary and art criticism, leading to long-term errors in understanding. To see literary and art criticism as nothing more than an instrument of political struggle on the literary and art front, with the result that struggle becomes everything and criticism becomes an end in itself, violates the "double hundred" policy and leads literary and art criticism onto a mistaken and unscientific path opposed to the party spirit.

We all know that the basic aim of socialist spiritual production is the satisfaction, to the greatest extent possible, of the ever increasing cultural needs of the masses. The correct goal of literary and art criticism should be, and can only be, the development of the productive forces of socialist literature and art, the promotion of a flourishing situation in socialist literature and art, the satisfaction of the ever increasing legitimate needs of the people in their spiritual life and the fostering of new socialist man. Since literary and art creation should pay attention to social effects, literary and art criticism should also pay attention to social effects. An important criterion for judging whether the effects of literary and art criticism are good or bad is whether socialist literature and art are flourishing or declining. From history we can see that any progressive literary and art criticism plays a positive role in promoting the development of literature and art. At the beginning of our country's Tang dynasty, Chen Ziang advocated the "style of Han and Wei" in literature and art, offering theoretical criticism of the overly elaborate formalism inherited from the Qi and Liang dynasties' emphasis on "overelaborate beauty and form." In this way he began a new poetic style, opening up the way for the flourishing development of Tang dynasty poetry. In Russia in the 19th century, it was the theoretical criticism of Belinskiy, Chernyshevskiy and Dobrolyubov that led to the development of the literary movement of critical realism in a more self-aware fashion, and to the eventual triumph of this movement. A cause-and-effect relationship exists between correct literary and art criticism and the flourishing of literary and art creation. We should pay attention to this rule of internal connection.

When we say that the aim of literary and art criticism should be to promote the development of a flourishing situation in literary and art creation, we do not mean that we can neglect to criticize and struggle against works, ideological trends, and literary and art views that express erroneous tendencies. The point to be remembered is that criticism and struggle should not be taken as ends in themselves. We should pay close attention to the special characteristics of struggle in literature and art. Comrade Mao Zedong said: "The principal method of struggle in literary and art circles is literary and art criticism." This is undoubtedly correct. Literature and art have always developed out of struggle. Take, for example, the situation after the fall of the "gang of four." Had the broad masses of literary and art workers not struggled against and criticized the dictatorship theory, the sinister line on the literary and art front of the "whatever" viewpoint, the "proceeding from the line," the "three emphases" and other idealist fallacies, would it have still been possible for revolutionary realism in literature and art to achieve such an overwhelming victory? Today, if we fail to struggle against the erroneous trend toward bourgeois liberalization, a trend which violates the four basic principles, if we fail to criticize all negative, unhealthy and dangerous works and views on literature and art, and if we fail to criticize all viewpoints that lead to crude simplification or dogmatism in literary and art theory, then it will certainly be impossible to have a healthy development in literature and art. Strictly observing the special characteristics of literature and art, we should use literary and art criticism to uncover and affirm good and relatively good works. While upholding the principle of creative investigation, we should criticize all unhealthy and incorrect creative tendencies and all bad works. Under normal circumstances, however, encouragement should play the dominant role. We should promote and support both the free competition of different literary and art works and the free debate of different literary and art viewpoints. By constantly summarizing our experience of literary and art creation and investigating the rules governing the development of literature and art, we should try to guide the development of literary and art creation and the literary and art cause. In this way it will be possible to achieve the goal of promoting a situation of flourishing literary and art creation and of promoting the cause of literature and art.

II

If literary and art criticism is to be carried out in a regular fashion, we must take pains to guarantee the correct nature of such criticism. What is meant by correct criticism? More than 100 years ago, the great Russian poet Pushkin commented that "criticism is a science." "Criticism is the science that seeks to uncover the beauty and failings of a literary or art work."

("On Criticism," "Selected Translations of Ancient Literary and Art Theory," Vol 2, p 153) In his speech "Several Questions on the Ideological Front," Comrade Hu Qiaomu stated that "correct criticism does not depend on status but on science and art; that is to say, it depends on truth and correct methodology." He also said: "Literary and art criticism is a specialized branch of science." "Criticism itself is, to varying degrees, both a type of scientific research and a form of creative labor." These comments really hit the nail on the head. They not only correctly reveal the nature of literary and art criticism but also cut right to the core of the problems that have affected our literary and art criticism for many years.

The most basic demand of literary and art criticism that is both Marxist and scientific is that one should adopt the attitude and method of seeking truth from facts. Literary and art criticism can be adjusted to suit different times and different circumstances as well as different points of emphasis. However, there should be no contradiction, and it is essential to preserve consistency. We cannot say one thing today and another thing tomorrow. We must be firm in our principles on questions of theory and should avoid shifting back and forth. As far as works of art or literature are concerned, "only when criticism says what is good and what is bad will it benefit the author or artist." ("Complete Works of Lu Xun," Vol 4, p 395) Extreme forms of pragmatic criticism that either "praise to the skies or consign to oblivion" violate scientific principle. Literary and art criticism must be able to withstand the test of history and practice.

If literary and art criticism is to be scientific, we must first of all have a complete and historical understanding of the object of such criticism. On this question, Lu Xun once made some very well-known and insightful comments: "I believe that if one is to judge literature in a relatively accurate manner, it is important to pay attention to the complete text; the entire character of the author and his position in society." ("Complete Works of Lu Xun," Vol 6, p 344) Lu Xun's viewpoint is entirely in keeping with dialectical materialism. Engels' discussion of Goethe and Lu Xun's criticism of Tao Yuanming provide us with examples of how criticism should be carried out. Engels recognized not only that "Goethe was at times extremely great," but also that he was "at times extremely small." "While Goethe was sometimes a rebellious genius who loved to ridicule and dared to disdain the world, he could also be an overcautious, self-satisfied and narrow-minded mediocrity." ("Collected Works of Marx and Engels," Vol 4, p 256) Lu Xun took note of the "inactive and carefree" side of Tao Yuanming's character expressed in lines such as, "Picking chrysanthemums by the east fence, in the distance I see the southern mountains." However, he also appreciated the "steely and angry gaze" found in other poems: "Jing Wei carries slivers of wood; to fill the vast sea, Xing Tian dances with his sword, his fierce will forever firm." "'Fierce will forever firm,' and 'In the distance I see the southern mountains' represent different sides of the same person, and to emphasize one side at the expense of the other distorts this person's true character, and the more such distortion occurs the more divorced the criticism is from reality." (ibid., p 336) It is most unfortunate that it was not at all rare for literary and art criticism in the past to ignore the "whole person" and to ignore the "whole work." This tendency to focus on minor details at the expense of the whole and to use sections of a piece completely out of context led to criticism that was, on the whole, "divorced from reality."

Literature and art use images to reflect life and express thinking and emotion. Scientific literary and art criticism should proceed from an understanding of artistic images and should avoid analyses and assessments that are divorced from images. In assessing the thinking and emotion revealed by a work's images, it is essential to observe the work's main trend. Comrade Stalin believed that the value of a literary or art work is determined not by "specific details" but by a "general tendency." ("Complete Works of Stalin," Vol 12, p 101) While a work might contain certain noteworthy descriptions, if the main trend is bad we should be negative in our criticism. If the main trend of a work is basically good, our criticism should be positive even though there might be certain shortcomings. Perfect works are, of course, good; unfortunately, however, they are very difficult to come by. Lu Xun was very much opposed to metaphysical literary and art criticism that "demanded perfection." He saw no point in demanding that "all jewelry be pure gold" and all characters be "absolutely perfect." He opposed "rejecting the whole thing because of one shortcoming." He compared flawed works with "bruised apples," and hoped that "critics would be able to gouge out the bruised portions." If an apple is bruised this does not mean we should "refuse to put it in the basket." ("Collected Works of Lu Xun," Vol 5, p 94)

Owing to the effects of the "leftist" guiding ideology in the past, it was common for people to adopt a pragmatic attitude in their treatment of literary and art criticism. This ran completely counter to the scientific attitude and methodological demands discussed above. Neglecting both analysis of artistic images and main trends, they invariably seized on a few isolated sentences and specific details, arbitrarily extending meanings and passing judgment. Kang Sheng's attack on the film "A Thousand Li Against the Wind" as a "poisonous weed" is an example of such simplistic, crude methods. He cooked up a series of charges by saying that the words uttered by the film's reactionary characters represented the thinking of the author. During the 10 years of turmoil the methods used by Lin Biao and the "gang of four" to arbitrarily extend meanings and draw inferences were often even more absurd than those of the "index group" in Hong Lou Meng studies: "Hai Rui Resigns From Office" was seen as an attempt to vindicate Peng Dehuai; the great red horse in the opera "Three Visits to Taofeng" was interpreted as an attempt to "revive the counterrevolutionary revisionist line of Liu Shaoqi," and any suggestion that the sun had dark spots was seen as an attack on Chairman Mao. There was every type of absurdity imaginable. Such anti-scientific literary criticism embodied an idealist and metaphysical approach. Although scientific literary and art criticism has its own special rules, once it departs from dialectical and historical materialism it will easily go astray.

If literary and art criticism are to become an art, whenever we assess a work of literature or art we must combine ideological analysis with artistic analysis, linking the social value of a work with its aesthetic value. Any art or literary work will always have a certain ideological content as well as an artistic form. As long as criticism concentrates on analysis of political content alone or, on the other hand, ignores ideological content and concentrates on examining artistic form at the expense of everything else, it is impossible to talk of literary and art criticism being scientific. Certainly, as far as the relationship between content and form is concerned. it is content that plays the leading role, and in the relationship between ideology and art it is ideology that occupies the more prominent position. However, in a single work's content and form, ideology and art combine to form an integral whole. We regard literature and art as such because of their special artistic conception, artistic expression and artistic form. The significance of this is that, far from being something of secondary importance, artistic content is an important prerequisite for literature and art. Comrade Zhou Enlai put this very well when he said, "If politics replaces art there will be no culture. Will there be anything left worth looking at?" Clearly it is artistic content that differentiates literature and art from politics, philosophy and other ideologies. Moreover, this artistic content is of critical importance to the survival of literature and art themselves; in fact it is this which actually determines their nature as literature and art. In a good work, ideological content and political content "flow naturally from the scenes and plot of the work." For this reason, when assessing a work of literature and art, we should start with an analysis of the work's artistic content, combining rather than separating the analysis of art and ideology, uniting rather than separating ideological and artistic criteria. The position of artistic analysis in literary and art criticism was ignored for a considerable period of time in the past. Political criteria became not only the foremost consideration but the only consideration. Political judgment replaced artistic analysis. Such literary and art criticism was of little use in helping the author sum up his creative experiences or in helping the reader to appreciate the work. Since we demand that revolutionary ideological content be combined with the best artistic form possible, when it comes to literary and art criticism our judgments should be based on "aesthetic and historical considerations" as well as a viewpoint that unites ideology and art. Only when this is the case will it be possible to have valuable and scientific criticism. Comrade Mao Zedong said: "We oppose both the tendency to produce works of art with a wrong political viewpoint and the tendency toward the 'poster and slogan' style, which is correct in political viewpoint but lacking in artistic power. On questions of literature and art we must carry on a struggle on two fronts." ("Selected Works of Mao Zedong," Vol 3, p 826) This is a principle that should be firmly upheld by scientific criticism of literature and art.

III

The crux of regularizing literary and art criticism lies in upholding the party's four basic principles and the policy of literature and art serving the people and socialism and of "letting a hundred flowers bloom and a hundred schools of thought contend." Not only is the launching of literary and art criticism needed to uphold the party's four basic principles in literature and art and to adhere to the orientation of literature and art serving the people and socialism, but it is also implied in the idea of implementing the "double hundred" policy. We cannot set out to understand the "opening-wide" policy just by looking at the words. It seems that its purpose is to lump together various theoretical viewpoints and various literary and art works, making no distinctions between them and treating them all as being the same. We should not think that the criticism of erroneous literary and art viewpoints and works that show unhealthy tendencies is antagonistic to the "opening-wide" policy. It is not the purpose of the double hundred policy to open wide. It is the purpose of the "double hundred" policy to promote the proliferation of socialist literature and art and the progress of science. Comrade Mao Zedong said: "To 'open wide' means to let all people express their opinions freely, so that they dare to speak, dare to criticize and dare to debate." ("Selected Works of Mao Zedong," Vol 3, p 414) Our society is still filled with various contradictions. Although class struggle still exists within a definite sphere, what does exist in abundance in social life are contradictions among the people. The "double hundred" policy was put forth on that basis. It requires us to resolve contradictions among the people on the literary and art front, ideological problems among the people and questions of right and wrong in literature and art, including fallacious things in the spiritual world, by using democratic methods, the method of discussion and the methods of criticism and self-criticism. In the past, under the influence of the spread of class struggle, an excessive struggle was carried out on the literary and art front, with the result that when we were rectifying these "leftist" errors, another tendency emerged. This was because we lacked forceful criticism of the bourgeois liberalization tendency and the various vulgarized and commercialized unhealthy tendencies that indeed existed. Some people were fed up with being criticized and treated correct criticism as "wielding the big stick." Some people doing the criticizing were apprehensive about criticism, afraid of being misunderstood as "wielding a big stick." This situation was unfavorable to the development of our literature and art in the direction of serving the people and socialism. It was also out of line with the demands of the "double hundred" policy. Now, as we start to bring about a change in this situation and to launch literary and art criticism, we must bear in mind the experience and lessons of the past and unswervingly implement the "double hundred" policy, so as to enable literary and art criticism to develop in a perfect and sustained way.

In launching literary and art criticism in accordance with the demands of the "double hundred" policy, we must draw a strict line between contradictions among the people and contradictions between the enemy and ourselves. The launching of literary and art criticism among the people calls for the upholding of the policy of "unity-criticism-unity." We must first have a common desire and a benevolent attitude. We must hold discussions in a comradely way and treat others as equals. We must not use our influence to oppress others. As for comrades who have committed errors, in particular those who have committed serious errors, we should welcome any attempt on their part to mend their ways. It should be stressed that: "Questions of right and wrong in the arts and sciences should be settled through free discussion in art and scientific circles and through practical work in these fields. They should not be settled in an oversimplified manner." (ibid., p 388) "It means not coercing people with wrong views into submission but convincing them by reasoning." (ibid., p 415) We must definitely avoid capitalizing on other's vulnerable points, sticking labels on others, "wielding big sticks," making concerted attacks and launching campaigns. We must advocate criticism that seeks truth from facts, that is reasonable, balanced and convincing. We must oppose "criticism" that is hairsplitting, makes rude attacks, cooks up charges, is exaggerated and sets out to destroy people. Of course, just as we cannot "demand perfection" in literary and art works, so we cannot require absolute correctness in literary and art criticism. The quality of literary and art criticism can only be gradually improved in the course of practice.

Whether we can truly implement the "double hundred" policy in literary and art criticism depends to a great extent on whether there is countercriticism and whether we can achieve the "freedom of criticism and the freedom of criticizing criticizers" put forth by Comrade Mao Zedong. If the power of countercriticism is not protected, there is the danger of a "one-man show." With countercriticism, and allowing the criticized to keep their opinions and to defend themselves, we will be able to reduce or even avoid the evil consequences of the confusion of right and wrong, black and white, brought about by erroneous criticism. Differences of opinion among the people are tolerable. Truth is developed in the course of comparison and struggle with falsehood. Marxists should have confidence in their own strength. Falsehood will not stand up to refutation, whereas truth is irrefutable.

LENIN ATTACHED IMPORTANCE TO REFORMING STATE ORGANS

Beijing RED FLAG in Chinese No 5, 1 Mar 82 inside back cover

[Article by Wen Zehuan [7614 3419 3562]]

[Text] Lenin bitterly hated bureaucratic tendencies existing in state organs. He deemed that if we failed to carry out tenacious struggles against them systematically so as to reform state organs in real earnest, "we shall certainly be destroyed" by them.

Early in 1918, Lenin insisted on reforming state organs. However, the party was unable to put the task on the agenda as the civil war was still going on. After Soviet Russia won the war and entered into the period of rehabilitating the national economy and building up socialism, this subject of reforming state organs became a problem of great concern to Lenin. He pointed out: Reforming state organs is a problem that "particularly interests me." If we "are determined" to do so, "it will be a great asset and guarantee us success." ("Collected Works of Lenin," Vol 33, p 355) From December 1922 to March 1923, through letters and dissertations, Lenin proposed many times to the party Central Committee that state organs be reformed and clearly pointed out that reforming state organs was a major task during the time of peaceful construction. He said: "The problem of running and improving our state apparatus is a very difficult one that is far from being solved, and it must be solved urgently." ("Selected Works of Lenin," Vol 4, p 693) He also said: "With the onset of peace and the satisfaction of the minimum requirements against famine, all our work must be directed toward improving the administrative machinery." ("Collected Works of Lenin," Vol 36, p 619)

Hence, what should be done for reforming state organs? Lenin believed that in order to attain the goal of reform, some strong, practical measures must be taken.

1. Streamline state organs. Lenin pointed out that with a view to improving work efficiency and saving on expenses, the number of staff members in state organs must be reduced to the minimum so as to strengthen the ties between state organs and the masses. In his letter to members of the Collegium of the People's Commissariat for Workers' and Peasants' Inspection, Lenin said: "You have a staff of 8,000 instead of 9,000. Would it be possible to cut it down to 2,000, with salaries for 6,000 (i.e., to treble the payment) and improve their qualifications?" ("Collected Works of Lenin," Vol 36, p 602)

2. Select qualified personnel. Lenin pointed out: It is necessary "to select and concentrate a staff of workers who are really abreast of the times, that is, who are not inferior to the best West European standard." His principle of selecting staff was "better fewer, but better." Except for those being recommended, the staff "must pass a difficult test, such as a test of knowledge of our state apparatus and a test in the fundamentals of the theory of our state apparatus, in the fundamentals of management, office routine, etc." ("Selected Works of Lenin," Vol 4, p 702)

3. Improve work style. Lenin often instructed workers of state organs to get in touch with reality and solve various problems arising in actual life. He sharply denounced those phrasemongers who divorced themselves from reality and "the arrogance of party members," and he often advised government workers to speak "fewer pompous phrases and do more plain, everyday work." ("Collected Works of Lenin," Vol 29, p 389) In his letter to the Central Statistical Board in 1921, Lenin asked them "to put 99 percent of the personnel on processing data that are practically and urgently required for our economy." ("Collected Works of Lenin," Vol 33, p 13)

4. Carry out inspection and supervision. Lenin maintained that strengthening inspection and supervision in state organs was also an important measure for reforming state organs. Under Lenin's leadership, the State Control Department was set up in 1918, and in 1920, the State Control Department was turned into the Workers' and Peasants' Inspection Department. Then in 1923 the Workers' and Peasants' Inspection Department was amalgamated with the Central Control Commission on the proposal made by Lenin to the party Central Committee so that the new organ had extensive power to inspect and supervise state organs. At the same time, he also stressed that the party and state leading comrades themselves should practice inspection and supervision over state organs. In his decree on the functions of the deputy chairman, Lenin pointed out: "The main functions of the deputy chairman are to exercise executive control over the fulfillment of decrees, laws and decisions; to reduce the staffs of Soviet government offices and supervise the reorganization of their activities along proper and rational lines; and to combat bureaucratic methods and red tape." ("Collected Works of Lenin," Vol 33, p 298)

RESTRUCTURING ADMINISTRATIVE ORGANIZATIONS IS A REVOLUTION

Beijing RED FLAG in Chinese No 6, 16 Mar 82 pp 2-5

[Article by Editorial Department]

[Text] The party Central Committee has grasped restructuring administrative organizations as its number one task since the beginning of this year. At present, this task is being carried out first by the central party and government organizations and will then be carried out level by level in a planned way throughout the country. The vast numbers of cadres and the broad masses of the people are inspired and they enthusiastically support the current restructuring. There is no doubt that the party Central Committee's important policy decision on restructuring administrative organizations enjoys immense support from the whole party, the whole army and the people of the whole country.

Why do we now have to restructure administrative organizations? With the promotion of our socialist modernization programs, the situation in which our country's production relations and certain aspects of the superstructure are not suited to the development of productive forces is becoming increasingly serious and conspicuous. For example, the intolerably serious bureaucratic tendencies and low efficiency have resulted from overlapping and overstaffed administrations with their multitiered departments crammed full of superfluous personnel who are in posts with no clearly defined duties and who are engaged in endless haggling and shifting of responsibility. These have actually become serious obstacles to the promotion of our modernization programs. If we are not determined to go in for restructuring, it will be hard to keep up no matter how correct the party's line, guiding principles and policies are and no matter how fruitful our work has been. We cannot just sit here and unfeelingly watch our party and government organizations becoming devoid of vigor and efficiency. Being devoid of vigor and efficience obstructs the full implementation of the party's correct line, guiding principles and policies and stops us from scoring greater achievements in our work. Of course, our whole party must not remain different toward this state of affairs; otherwise, as executors of the people's instructions, can we still have a clear conscience?

Let us look back on the historical events of the past 5 years. Since October 1976 our party has fulfilled three very important tasks of profound historic significance. The first very important task was the smashing of the counterrevolutionary clique of Jiang Qing. This smashing extricated the party from calamity and saved the revolution. The second very important task was the convocation of the 3d Plenary Session of the 11th CCP Central Committee. This convocation revived the party's ideological line of seeking truth from facts, began bringing order out of chaos in an all-round way and determined the shift of the focus of the party's work. The third very important task was the convocation of the 6th Plenary Session of the 11th CCP Central Committee, which approved the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC," summed up both positive and negative experiences, correctly evaluated the historical role played by Comrade Mao Zedong and Mao Zedong Thought in the Chinese revolution and pointed out the orientation for the continued advance of our country's socialist cause and the work of our party. At the same time, this plenary session also readjusted the leading group of the CCP Central Committee, thus enabling the party Central Committee to have a very strong and united leadership core. The decision to restructure administrative organizations and thoroughly reform the cadre system is the fourth very important task which is being carried out by our party. This very important task has a great bearing on making continued efforts to open up new prospects and give full play to the superiority of the socialist system. It also has a very vital bearing on whether we can carry forward the organizational line and forge ahead into the future so as to guarantee the successful promotion of our modernization programs, and will affect the rise or fall of our party and our country. If this task is fulfilled successfully, our country will have great order and stability for a long time to come and will also prosper. It is quite clear that due to the successful fulfillment of the three very important tasks mentioned above, the major policies of our party and our country have been determined and the situation of unity and stability is being consolidated day by day, thus creating conditions for successfully carrying out the fourth very important task. Vast numbers of cadres and the masses have longed for the streamlining of administrative organizations and the reforming of the cadre system for a very long period of time and the great majority of the people of our country have achieved a common understanding of the streamlining and the reform. The longing and the common understanding have laid the ideological foundation for successfully fulfilling this important task. The party Central Committee has conscientiously summed up historical experiences and adopted, after careful consideration, the correct guiding principles, policies and measures for carrying out the restructuring. This offers a solid and reliable guarantee for the successful fulfillment of this task. In particular, while proletarian revolutionaries of the older generation and many of our party's long-tested, loyal and devoted comrades are still living and in good health, we should avail ourselves of this golden opportunity to rely on their experiences, wisdom and prestige to carry out the restructuring. Therefore, we must be resolute, surmount difficulties in and obstacles to the restructuring and strive for victory in the restructuring.

With regard to the current restructuring, Comrade Deng Xiaoping clearly noted: In a certain sense, restructuring administrative organizations is a revolution. However, this is aimed at revolutionizing administrative organizations and the system, and it is not a revolution against people. This is a very penetrating judgment which clearly points out the character and the mission of this revolution. Of course, it is not a political revolution in which one class overthrows another class. We have drawn a conclusion from the "Great Cultural Revolution," which was a civil disturbance: Under the socialist conditions, this kind of political revolution had neither an economic basis nor a political basis. In this sense, we deem that restructuring administrative organizations is imbued with a revolutionary character. This is because the restructuring is aimed at reforming those parts of our party and government organizations that are incompatible with our socialist modernization programs. In other words, this is a revolution against overstaffed organizations, irrational systems and all sorts of bureaucratism. There should be no misunderstanding of this point. A revolution that is imbued with this kind of character must be carried out under the leadership of our party and through the socialist system. Moreover, we must adopt measures that conform to the PRC Constitution and the party constitution so that we can carry out a well-guided, systematic and orderly revolution and further improve and strengthen, within the framework of the leadership system, the state system of the people's democratic dictatorship. This is essentially the socialist superstructure going through a process of self-regulation and self-perfection to eliminate its own defects. It is imperative to go through a long process in turning those relatively imperfect and unsound parts of our country's socialist superstructure into relatively perfect sound ones. The development of socialist productive forces will certainly require the timely and resolute reform of those specific systems that hamper the development of the productive forces. This is the demand made of us by the logic of historical development.

In fact, the basic theory of the current revolution was advanced long ago at the 3d Plenary Session of the 11th CCP Central Committee. The communique of the third plenary session noted: "Carrying out the four modernizations requires great growth in the productive forces, which in turn requires diverse changes in those aspects of the production relationships and the superstructure that are not in harmony with the growth of the productive forces, and requires changes in all methods of management, actions and thinking that stand in the way of such growth. It is, therefore, a profound and extensive revolution." This theory has been further expounded in the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC." The "Resolution" noted: The process, from the implementation of socialism until communism is finally realized, is a great revolution, unprecedented in human history. "Differing from the revolutions before the overthrow of the system of exploitation, this revolution is carried out not through fierce class confrontation and conflict, but through the strength of the socialist system itself, under leadership, step by step and in an orderly way." The "Resolution" added: Our present endeavor to build a modern socialist China constitutes but one stage of this great revolution. Our current restructuring of administrative organizations is precisely a major strategic move at this stage. It essentially demands that we use the revolutionary spirit to thoroughly restructure our country's leadership and management systems including the cadre system. Historical experience gained since the founding of the PRC shows that with the exception of the "Great

Cultural Revolution," which was a civil disturbance, although the streamlining of administrative organizations and the fight against bureaucratism have been carried out many times, the "streamlining" always ended up with more unwieldy organizations and with bureaucratic phenomena as rife as before. Practice has proved that if we just treat symptoms and not the disease, we will never be able to solve fundamental problems. The current accumulated problems in party and government organizations at all levels and also in the cadre system are more serious and complicated than those before the "Great Cultural Revolution." If we are not determined to carry out a revolution, we will not be able to streamline administrative organizations, will not succeed in reforming the management system and the cadre system and will also fail to overcome bureaucratism. If things continue this way, our modernization programs will become hopeless programs and our party and our country will even be in danger of being subjugated.

What, then, are the main contents of this revolution?

First, it is imperative to conscientiously streamline administrative organizations. To promote our socialist modernization programs, all our administrative organizations must have scientific division of labor, clearly define the duties incumbent on each person and post, handle affairs promptly and correctly and reach unanimity through consultation. Therefore, the current restructuring must proceed from actual needs; determine the organic structure, the number of required personnel and the tasks of each organization; and establish a stringent system for checking on working personnel of the state and a stringent system of rewards and penalties for working personnel of the state. Through the restructuring, we must turn our administrative organizations into able and efficient ones and raise work efficiency. We must conscientiously eliminate the malpractices resulting from overlapping and overstaffed administrations with their multitiered departments crammed full of superfluous personnel who have no clearly defined duties in their posts and resolutely overcome the phenomena of shirking responsibility and taking a dilatory and irresponsible attitude toward work.

Second, it is imperative to carry out a fundamental reform of the cadre system. This means abolishing the existing life-tenure system of leading cadres. On the one hand, we must establish a system to enable old cadres to retire, to leave jobs for convalescence or to withdraw to the second line. This system is fundamentally different from "remaining a revolutionary to the end of one's life." On the other hand, we must also pick the good and select the capable for public posts. This means promoting a large number of young and middle-aged cadres to leading posts at all levels and, depending on their integrity and ability, to turn our leading groups into revolutionary, young, learned and professional groups. Only by so doing can we put an end once and for all to the aging circle within leading groups. The key to reforming the cadre system lies in selecting young cadres. We must select good cadres and insist on having cadres who have both ability and integrity. We absolutely must not promote those people who built themselves up by following Lin Biao and Jiang Qing and their partners and by becoming rebels; those people who are imbued with serious factional ideas; those people who were engaged in beating, smashing and looting; and those people who have violated the law and discipline in either the political field or the economic field during the past few years. Such people who have already been promoted to leading posts must be resolutely dismissed from their posts.

Third, it is imperative to do well in training cadres in rotation. According to the new demand set on our cadres by the historical tasks of the new period, our cadres not only must have lofty revolutionary ideals and the spirit of being brave in devoting themselves to the revolutionary cause but must also have competent scientific and cultural knowledge and the professional ability to carry out work. Many of our cadres have met the requirements after tempering and educating themselves over a long period of time. However, a considerable number of cadres, for various reasons, have not met or have not fully met the requirements. Therefore, it is quite necessary to train cadres by stages and in groups, strengthen the building of the cadre ranks, enhance the quality of the cadre ranks and enable our cadres to master the skills needed for organizing domestic economic construction and developing economic relations with foreign countries.

Fourth, it is imperative to lay the foundation for the reform of the whole country's implementation of an overcentralized management system in the economic, political and cultural fields and also in social life, our party and government organizations and departments administered many affairs that should not be and cannot be administered by them, and administered many affairs that can never be successfully administered by them. Therefore, we must take the current restructuring of administrative organizations as the forerunner and further reform the whole country's management system. Affairs that should be handled by enterprises and public units must be resolutely given to such enterprises and units, and such affairs must no longer be handled by party or government organizations. We must also draw a distinction between party and government work and truly change the long-standing phenomena of there being no distinction between party and government work and of the party neglecting party work.

Obviously, the task of completing, within a relatively short period of time, this restructuring, which is of such great revolutionary significance, is a very arduous task. How, then, are we to fulfill this task? A revolutionary cause must be accomplished with a revolutionary spirit. The revolutionary spirit we are referring to is the thoroughgoing revolutionary spirit that embodies the intrinsic quality of the proletariat. The proletariat is the last exploited class in history. Only by emancipating all mankind can the proletariat achieve its own complete emancipation. The historical mission of the proletariat is to remold the whole society and to realize communism. The accomplishment of this great cause demands that within a very long historical period of time, many generations must carry on the struggle unremittingly and with strict discipline, solidarity and the courage to devote themselves to the cause. This is precisely the thoroughgoing revolutionary spirit of the proletariat. As a major strategic move during the historical period of carrying out our socialist modernization programs, the great task of restructuring administrative organizations can only be accomplished with this kind of thoroughgoing revolutionary spirit. The unwieldy administrative organizations we established have become our customary form of management. To reform this form of management, we must change our patterns of action, our mode of thinking and those old habits, ideas and styles which were created by the narrow view of small producers. This is bound to conflict and clash with our own feelings, habits and personal interests. Certainly, the reshuffling of administrative organizations, the division of labor and work coordination in all fields, formulating stipulations concerning the limits of authority and duties and particularly personnel changes that affect tens of thousands of people are all very arduous tasks. In addition, it is possible that some out-and-out individualists and some people with ulterior motives will seize the opportunity to make trouble. Therefore, we have to maintain due vigilance. We must use the revolutionary spirit to overcome all difficulties and obstructions. When this kind of revolutionary spirit is manifested in the guiding thought for the restructuring, it means pressing forward with indomitable will and being fully confident of achieving the inevitable victory. When this kind of revolutionary spirit is manifested in actions for the restructuring, it means being firm and unshakable and also means that no matter how complicated and difficult the conditions are, one must not hesitate or compromise, still less give up halfway. When this kind of revolutionary spirit is manifested in the measures for the restructuring, it means that the criterion of giving all to meet the needs of the revolution and the construction should be adopted, that administrative organizations must be streamlined and that each staff member must be charged with specific responsibilities. When this kind of revolutionary spirit is manifested in the demands set on each individual, it means that every individual must take the interests of the whole into account, set store by the revolutionary cause and subordinate one's personal interests to the overall, long-term and fundamental interests. The current restructuring must meet the following demands made by the party Central Committee: Improve the quality of work and raise work efficiency in all administrative organizations and guarantee a successful realization of our modernization programs. In short, during the current restructuring, we must attach primary importance to having great determination and attach secondary importance to being meticulous in work. We must conduct thoroughgoing and painstaking ideological and political work, and inspire and heighten all party members' and cadres' awareness and sense of discipline in responding to the call of the party Central Committee. However, being meticulous does not mean being overcautious. If we are bogged down in meaningless worries, are pinned down by minor questions, cannot step forward and cannot make a breakthrough, we will not be able to fulfill any major task for the revolution or the construction.

We should especially point out that the presence of our veteran cadres is the major factor that will guarantee the success of this revolution. Our country is a socialist country established after going through a protracted revolutionary war. Our country has a group of veteran cadres who withstood tests in different revolutionary periods and who are now the precious riches of the party and the state. Our veteran cadres performed feats that can never be obliterated, for the party and the people during the war years, during the period of White terror and during the struggles to establish and consolidate state power and to develop the socialist cause. The history of the Chinese revolution and construction has repeatedly proved that veteran cadres of our party are worthy of the title, backbone of the great cause of the Chinese people. However, the life of an individual is limited and the knowledge and experience of an individual are also limited. An individual can only play a certain role for a certain period of time in the long process of history. With the passage of time, many of these veteran cadres, who are still living and in good health, become, after all, senescent and weak. Their ability to shoulder heavy burdens is steadily decreasing. This is a natural law that is irresistible. We must solve in an orderly manner and in a planned way the problem of replacing veteran cadres with new cadres in order to carry forward the cause pioneered by proletarian revolutionaries of the older generation. We must guarantee the continuity of the party's line, guiding principles and policies, the inheritability of the party cause and the maintenance of the situation of unity and stability in our country. If the replacement of veteran cadres with new cadres ends in failure, our party and state may face upheavals once again. All our veteran cadres must take on these important political responsibilities. They should regard completing the current restructuring of administrative organizations, retiring from office or withdrawing to the second line according to regulations, picking the good and selecting the capable for public posts and recommending and promoting able and politically reliable successors as the greatest contributions they can make to the party in their later years and also as their most glorious historical mission. As a big party and a big country, the CCP and China need several dozen veteran cadres to stay at the central leading posts of the party and state so that they can stabilize our battle formation. The several dozen veteran cadres must be world-famous, circumspect and farsighted, have the aptitude of being able to take the whole situation into account and plan accordingly and still be very energetic. Other veteran cadres must gloriously "retire from military service" according to regulations after reaching a certain age. In their later years, veteran comrades must attach primary importance to taking good care of their own health and attach secondary importance to maintaining links with the masses and developing public welfare business. In particular, they should participate in the social activities of educating the younger generation and continue writing and complete their own revolutionary memoirs.

This will be a rigorous test, related to a reform in the fundamental interest of the people of our country, of the party spirit of every party member and cadre. We believe that in this test the great number of our party members and cadres will prove to be loyal to the party, loyal to the people, and not disappoint the expectations of the party and people.

WILLINGLY SACRIFICE ONESELF FOR THE PARTY'S CAUSE--NOTES ON 'HOW TO BE A GOOD COMMUNIST'

Beijing RED FLAG in Chinese No 6, 16 Mar 82 pp 6-9

[Article by Chen Yeping [7115 6851 5393]]

[Text] Liu Shaoqi's "How To Be a Good Communist" stands out as a masterpiece in the Marxist literature of the party and has had a profound impact on our party. In the course of long revolutionary struggle and reconstruction it has helped the healthy development of millions of Communist Party members, and has played a very important role in the establishment of party members' proletarian world outlook, the strengthening of party spirit, the preservation of the party's nature as the vanguard of the proletariat and the raising of the party's fighting force. By studying this brilliant document "How To Be a Good Communist," contained in the first volume of the "Selected Works of Liu Shaoqi," we will come to appreciate the immortality of its thinking and also to realize that it is a sharp weapon that can be used to strengthen the party's construction. It should be used to guide the party's comrades in their efforts to improve self-cultivation in their struggle and self-sacrifice for the completion of the great communist cause.

I

Communist Party members should willingly sacrifice themselves for the party's cause. They must first of all develop an unshakable faith in the invincible nature of the communist cause and the great ideals of communism. Only when one has ideals and faith can one attain a lofty realm of thought, clearly determine the target of struggle and direction for work, protect vigorous and revolutionary ambition, willingly sacrifice oneself for the great communist cause, and struggle one's whole life for the party's cause.

Faithful and unyielding in their commitment, innumerable revolutionary martyrs and old proletarian revolutionaries dedicated their own blood and lives to the heroic cause of opening up the broad revolutionary path. The revolutionary martyr Xia Minghan righteously shouted: "As long as we are right it does not matter whether or not you decapitate me. You may have killed Xia Minghan but there will always be others to take my place." Filled with the faith the martyrs had in the invincible cause of communism, these resonant words express a boundless faith in those "people who will take my place." It was their commitment to the communist ideal and their faith in the certain victory of the communist cause that allowed them to have such lofty sentiments and to willingly dedicate, without any fear of hardship or sacrifice, all their energies and even their life to the communist cause. The vast majority of party members today, whether they be party members who withstood the test of war and the period of White terror or those who joined the party during peacetime, all of them are filled with confidence in the cause of the martyrs and old revolutionaries. They will struggle resolutely and tirelessly for the lofty ideal of communism and using the sweat of their own arduous labor, they will write the glorious historical poem that the martyrs left unwritten.

However, there are also a few party members, including certain old party members, whose communist ideals have begun to flag and whose faith has begun to waver owing to the corrosive influence of bourgeois thinking. Caring only for personal gain they have forgotten the aim of communism and have no concern for the future of either the party's or country's cause. Some even go so far as to say, "Ideals, ideals--if there is no profit it's not worth thinking about; future, future--forget it if there is no money." Some people are dispirited, losing confidence and becoming depressed as soon as they run into difficulties or suffer a setback. As soon as they see the bleak side of a situation they either lose all hope and become pessimistic or stand to one side spreading negative feelings. It is quite clear that such ways of thinking have nothing in common with the lofty spirit of the revolutionary martyrs. Anyone who has such an attitude cannot be called a member of the proletarian vanguard.

Struggling through to the end for the communist ideal is the loftiest of our party's principles and is the sacred and lifelong task of all party members. As Comrade Liu Shaoqi said, "It is our responsibility to follow the laws of human social development and promote the development of the communist and socialist causes so that communist and socialist society may soon become a reality." ("Selected Works of Liu Shaoqi," Vol 1, p 123) Whether a communist is worthy of the name hinges primarily on whether he has the determination to struggle to the end for the communist cause and whether or not he will willingly sacrifice his life to the party's cause without a moment's hesitation. Irrespective of the time or circumstances, every true communist should maintain an unshakable faith in the invincibility of the communist cause and should adopt the heroic attitude of "sacrifice for the revolution." Striving to overcome all difficulties that obstruct their heroic advance, the communist should work for the thorough victory of the communist cause and must be willing to shed his own blood in writing this new chapter.

The communist cause marks a completely new stage in human history. It is inevitable that as it advances forward it will run into various problems and difficulties. This was true during our country's period of democratic revolution as well as during the period of socialism. During the 32 years that have passed since the founding of the PRC, we have had both the experience of success and the lessons of failure, times of smooth development and also times of serious setback. Certain mistakes made in the guidance of our work have been detrimental to our cause. Some unhealthy thinking and work styles still exist in our party, seriously damaging the relations between the party and the masses. The 10 years of destruction brought about by the counterrevolutionary cliques of Lin Biao and Jiang Qing were catastrophic for both the party and the people of the whole nation. We should adopt an attitude of historical materialism in dealing with these difficulties and setbacks, and should reach a correct understanding through analysis based on seeking truth from facts. We must certainly not allow these mistakes and shortcomings in our party's work to undermine our firm faith in the party. Even less should we see the catastrophic destruction wrought by Lin Biao and the "gang of four" as the product of the socialist system itself. Whether or not a party is a truly Marxist political party depends not on whether or not it makes mistakes but on whether or not it has the courage and strength to overcome its own mistakes. The question, therefore, is not whether complications occur during the forward march of socialism, but whether or not we can draw the lessons and summarize the experiences of these complications and continue to move forward along the correct road. Facts show that our party is not only good at following the tide of history, courageous in fighting the forces of evil, and overcoming difficulty and hardship, but also dares to reveal its own shortcomings and errors, and actively seeks to correct and overcome them. Especially since the 3d Plenary Session of the 11th CCP Central Committee, our party has pursued a policy of bringing order out of chaos, establishing a Marxist ideological, political and organizational line and determining a series of important principles and policies. By correctly summarizing historical experience, our party has found a path toward socialist modernization that suits the national characteristics of our country. As a result, the national economy is now advancing healthily and steadily along the correct track. Our future prospects are glorious. Our cause has great hope. Feelings of pessimism, hopelessness and dispiritedness are all incorrect.

Addressing himself to those comrades who lacked ambitious ideals and a practical spirit, Liu Shaoqi in "How To Be a Good Communist" emphasized that, "We Communist Party members must have the highest goals in our struggle and the highest ideals, while at the same time we must have a practical spirit and do real practical work." "Only by combining the great and lofty ideals of communism with a real practical spirit can one be a good communist." (ibid., pp 128-129) These words still have great significance today and merit serious attention. A person without lofty ideals will never be anything more than a shortsighted and ineffectual mediocrity. A person who lacks a practical spirit and does no real work will be a prattling onlooker. Grand and imposing buildings are always built brick by brick. The success of an undertaking does not come about through talking, even less through waiting, but depends on real work. While communism has lofty ideals, if these ideals are to be realized each item of work must be carried out in a concrete fashion. For this reason, a Communist Party member must combine these lofty ideals with a determination to do a good job of one's own work. Our country is now going through a historical period of great change and development, moving from chaos into order and from poverty into wealth. The whole party and the whole nation is involved in the struggle to create a powerful socialist nation with a high degree of material and spiritual civilization. Communism must inevitably pass through this stage; it is an indispensable aspect of the communist cause. Only when this historical task has been completed will it be possible to provide the material base and spiritual conditions necessary for the realization of true communism. Every party member should devote himself to the party's cause and should have concern and deep love for this cause. Dedicated heart and soul to the same cause they must struggle in an earnest and down-to-earth way. And by working selflessly at their posts and by scoring outstanding results they will be able to make a personal contribution to the four modernizations.

II

The personal interests of a Communist Party member must be sacrificed unconditionally to the interests of the party as a whole. It might at times be necessary to sacrifice personal interests in order to protect the interests of the party. This basic demand that personal interests be sacrificed for the party's cause is a principle that should govern the thinking and deeds of every Communist Party member. It is a condition that every Communist Party member must satisfy.

Our party is a political party that works wholeheartedly for the interests of the people. Aside from the interests of the working class and the people as a whole, the party has no special interests of its own. A party member who pursues his own special interests at the expense of the interests of the party and the people is not a true Communist Party member. A true Communist Party member must correct the relationship existing between his own personal interest and the party's interest and must, irrespective of time or place, put the interests of the party before his own individual interests. Our party has always acknowledged the individual interests of party members and has done as much as possible to accommodate these interests and to help resolve practical difficulties. However, at no time is it permissible to place these individual interests before those of the party or to sacrifice the interests of the party for those of the individual. Whenever a contradiction emerges between the party's interests and those of the individual, one must be willing to protect the party's interests without the least hesitation and voluntarily sacrifice one's own individual interests, and even one's life. This provides us with an important criterion for measuring whether or not a Communist Party member has the true party spirit.

If a party member's personal interests are to be unconditionally subordinated to the interests of a party, it is essential for each party member to have a lofty and selfless moral character and strive resolutely to overcome every form of individualism. Individualist ideology is rampant among certain comrades and has in some cases given rise to the corruption of extreme individualism. These people see the party's interests and lofty ideas as being empty and without relevance to their own lives. "Material benefits" are the only things they recognize. They fight for position and special treatment, demanding both official posts and authority; if they are unable to reach their goal they lose faith in the party and begin sulking and complaining. They pursue a life of luxury and ease; caring nothing for either the policy or principles of the party, they use every means possible to win favors for their families and sons and daughters. Their minds are obsessed with thoughts of advantage and material profit; they refuse to exert themselves if there is no profit to be had. They continually watch out for money, pull strings, go through the back door and engage in other crooked practices. Some people have no qualms whatsoever about various illegal practices such as using official privilege for private gain, speculation and profiteering, corruption, smuggling, bribery and even embezzling state property. Their deeds have already sullied the glorious reputation of Communist Party members, and there are some people who are becoming or have already become nothing more than common criminals.

Whether one performs one's duties honestly or decides instead to seek personal gain is the fundamental difference between the proletarian and capitalist world views. Personal gain is the very nature of capitalism and has nothing in common with proletarian ideology. Communist Party members are vanguard fighters who oppose the capitalist class and any other exploiting class. After overthrowing the exploiting class, how could these vanguard fighters possibly adopt the capitalist class' emphasis on profit as an article of faith? Individualism forces people to forget collectivism and Marxism and gives rise to the lust for personal gain. The history of our party is not without examples of the disgrace and ruin brought about by individualism, and we should take careful note of these painful lessons.

The problem now facing us is that if individualism is to be overcome, party members and cadres must be able to handle and employ their authority of office in a correct way and must under no circumstances use this authority to serve personal ends. Many members of our party hold important leadership positions or exercise a certain amount of authority at their work posts. It must be understood that this power has been conferred upon them by the party and the people in accordance with the needs of work and that in exercising this power they represent the party and government. No matter how great one's power might be, one always has a duty to serve the people and under no circumstances does one have the right to use one's authority of office for personal ends or to commit other illegal acts. Seeing the authority conferred by the people as a privilege and abusing this privilege for private gain violates the aim of the party, betrays the trust of the people and damages the prestige of the party among the masses. A Communist Party member must be faithful in the discharge of his duties no matter what the job. He must be rigorous in carrying out the responsibilities of his office. Using the power conferred upon him by the people to serve the people, he should become a diligent and conscientious public servant who lives up to the trust and expectations of the party and people through his own exemplary behavior.

III

If we are to sacrifice ourselves for the party's cause, we need to constantly cleanse ourselves of the dirt on our bodies, dare to carry out struggles against all erroneous ideologies and unhealthy tendencies, adhere to truth, rectify mistakes, distinguish between right and wrong, be open and aboveboard, and struggle to maintain the purity of the ranks.

Our country is in an historical period where we are carrying forward the revolutionary cause and forging ahead into the future. Profound social changes are taking place. Under such circumstances, all kinds of ideologies and tendencies will emerge. Capitalist and feudal ideological influences constantly come to the fore. The venom of Lin Biao and the "gang of four" has not yet been thoroughly eradicated. This, together with the fact that we are expanding contacts with foreign countries, enables the bourgeois ideology and lifestyle to corrupt some of our comrades. At present, the struggle between corruption and anticorruption is a struggle to uphold the purity of the party and sternly tests party members. Consequently, party members should, as required by Comrade Liu Shaoqi, strengthen self-cultivation on all sides, self-consciously resist the corruption of bourgeois and all nonproletarian ideological styles, and struggle against all phenomena that endanger the interests of the people.

Bourgeois ideology and various unhealthy influences are always present. However, they do not necessarily affect everybody. It all depends on whether that person's resistance is strong. The existence and size of this resistance, though there are many factors involved, depend primarily on whether you can be like a person who washes his face and sweeps the floor every day, that is, can constantly cleanse your body of political dirt. By self-consciously examining and overcoming your own shortcomings and errors, you will be adopting a sure way of improving yourself and doing your work well, and this will be a significant sign of being responsible to yourself and the people. Some comrades are reluctant to face up to their own shortcomings and errors. They always like to regard themselves as "consistently correct," have blind faith in themselves, claim credit for themselves and are arrogant, try to save face at the expense of truth, like to be flattered and dislike criticism. This attitude makes them dirty all over and causes them to degenerate further and further along the path of error. Owing to differences in background, experience, ideology, moral character and level of consciousness, everyone is bound to have one weakness or another, and this is bound to give rise to one or another shortcoming or error. No one is perfect in this world. Therefore, every comrade must know his own limitations and look at himself from the point of view that in everything one divides into two. He must constantly carry out self-criticism and self-transformation, cast off all burdens, travel light, raise his consciousness, increase his party spirit and be happy to perform the various items of work assigned by the party.

A good Communist Party member must not only dare to struggle against his own shortcomings and errors, but also dare to struggle against the various erroneous ideologies and unhealthy tendencies. At present, there are some party members who are pursuing a vulgar philosophy of life. They say that "making one more friend means having one more opportunity, while offending one more person means having one more obstacle" and "we should plant more flowers and less thorns, because work is easier if you spare other people's feelings." In the face of right and wrong, they fail to take a clear-cut stand, are not determined enough in their attitude, and fail to take charge of what they should take charge. They fail to criticize what they should criticize and fail to restrain and struggle against erroneous ideological tendencies, allowing them unbridled freedom and even join with them and get soiled. This attitude of "you're all right and I'm all right, so let's not interfere in each other's business" does not befit a member of the Communist Party. When considering and dealing with problems, Communist Party members should proceed from the interests of the party and not from personal loss and gain. In the face of principles and of right and wrong, they must take a clear-cut stand and be resolute and not vague. As for erroneous ideologies and unhealthy tendencies which are detrimental to the party and the people, Communist Party members should step forward bravely, stick to their principles and carry on the struggle. No matter whom they are dealing with, they must take charge of what they must take charge, criticize what needs to be criticized and restrain what must be restrained. They must on no account adopt an attitude that is liberal and which abets evil by tolerating it, or allow erroneous things to develop and spread. As long as it is for the sake of upholding the interests of the party and people, they should struggle against evil phenomena, even if this means offending some people or suffering themselves some temporary loss. It is worth doing so; ultimately, they will get the support and protection of the party and the people. If, when they know something to be wrong, they think it best not to comment and sacrifice the interests of the party in order to win over someone's "feelings," that will be a sign that they have abandoned their principles and soiled the party spirit, something which is incompatible with the glorious title of Communist Party member. All of our party's comrades must carry forward the revolutionary spirit of being selfless and fearless and carry out an unrelenting struggle to correct the party's work style, promote the people's work style and maintain the party's prestige. They must play an exemplary role in restoring and carrying forward the fine tradition and work style of the party and in building a socialist spiritual civilization. They must be Communist Party members in the real sense of the word.

IT IS IMPERATIVE TO RECTIFY STUDY STYLE WHILE RECTIFYING PARTY STYLE--READING VOLUME ONE OF 'SELECTED WORKS OF LIU SHAOQI'

Beijing RED FLAG in Chinese No 6, 16 Mar 82 pp 10-13, 20

[Article by Ma Wenrui]

[Text] Comrade Liu Shaoqi was a great Marxist-Leninist who made outstanding contributions to the shaping and development of Mao Zedong Thought. The publication of volume one of "Selected Works of Liu Shaoqi" has added valuable spiritual wealth to our party and people. Moreover, this work is permeated with a very important idea, that is, the good study style of integrating theory with practice. When studying the "Selected Works of Liu Shaoqi," we should properly study this Marxist study style, conscientiously rectify party style, and effectively strengthen and improve party leadership on various fronts.

I

The question of study style is closely related to the question of party style. Only if we have the Marxist study style of integrating theory with practice can we gradually foster the Marxist style of thinking and style of work. If we go against this principle, we will inevitably become separated from reality and from the masses, and even hurt the interests of the people and go against the Marxist style of thinking and style of work. As Comrade Mao Zedong said: "Study style is a question of the ideological method of comrades in our leading bodies, of all cadres and of party members, a question of our attitude toward Marxism-Leninism and of the attitude of all party comrades in their work." ("Selected Works of Mao Zedong," Vol 3, p 771)

Comrade Liu Shaoqi was a paragon in upholding the Marxist study style and he made many brilliant expositions on the question of study style. He said: "We must modestly study the Marxist-Leninist stand, viewpoint and method, study the noble proletarian quality of the founders of Marxism-Leninism, and apply all this in our practice, in our words and deeds, our daily life and work, constantly correcting or eliminating anything in our ideology contrary to it, and strengthening our own proletarian communist ideology and character. This means that we should listen modestly to the opinions and criticisms of our party comrades and of the masses, make a careful study of the practical problems in our life and work, carefully sum up and draw lessons from our experience in work. In light of all this, we should ascertain whether our understanding of Marxism-Leninism and our use of the Marxist-Leninist method are correct, and check up on our shortcomings and mistakes so as to overcome them and improve our work. Furthermore, on the basis of new experiences we should ascertain whether there are any individual conclusions or aspects of Marxism-Leninism that need supplementing, enriching and developing. In short, we must integrate the universal truth of Marxism-Leninism with the concrete practice of revolution." ("Selected Works of Liu Shaoqi," Vol 1, p 110; hereafter only the page number will be given) Here, Comrade Liu Shaoqi put forward three basic demands for upholding the Marxist study style: 1) use Marxism to purge all things contrary to this in our ideology; 2) use Marxism to examine the shortcomings and mistakes in our work and correct them; and 3) develop Marxist principles in the light of the new experience. If all our party members, especially the party's leading cadres, can examine their own thinking and work on the basis of these three demands, conscientiously and not perfunctorily carry out criticism and self-criticism, and overcome unhealthy tendencies together, our party style will certainly take a quicker turn for the better and we will certainly create a new situation in various items of work.

At present, some of our comrades are, to varying degrees, affected by the problem of impure work style, and this work style is closely related to their incorrect study style. This is mainly manifested in the following three aspects.

First, they are politically unable to completely fall into line with the CCP Central Committee. Some of them suspect and resist the line, policies and principles of the party since the 3d Plenary Session of the 11th CCP Central Committee, or verbally support them but act otherwise. Some of them go against the four basic principles, disregard party discipline and practice bourgeois liberalization. Practice has already fully proved that the four basic principles and the line, policies and principles of the party since the 3d Plenary Session of the 11th CCP Central Committee are completely correct. Why is it that some of our comrades still do not understand them at present and even go against them? They have one trait in common, that is, they are unable to use the correct attitude of integrating theory with practice in dealing with Marxism-Leninism-Mao Zedong Thought. As Comrade Liu Shaoqi pointed out: These people "have a lot of old junk accumulated in their heads and many stubborn habits, prejudices and selfish desires, and lack the determination to remold themselves." (p 114) "These people are absolutely incapable of guiding their lives by the principles of Marxism-Leninism, and hence incapable of dealing with practical problems promptly, correctly and realistically according to these principles; sometimes they even adopt a negative attitude when practical problems have already been correctly solved according to these principles by the party organization, or by comrades other than themselves." (p 115) Today, are not some of the comrades with "leftist" and rightist erroneous tendencies clinging to their "stubborn habits, prejudices and selfish desires" and "adopting a negative attitude" toward the correct leadership of the CCP Central Committee? This attitude is dangerous and intolerable and must be quickly corrected.

Second, they have a bureaucratic style. At present, some of our cadres are suffering from the bureaucratic style of languidness, indulging in rhetoric and divorcing themselves from the masses and from reality. This style is completely incompatible with seeking truth from facts and the mass line consistently maintained by our party. Comrade Liu Shaoqi in his work "The Leadership Style That Eliminates Empty Talk" sharply criticized some comrades for their bad style of "using a bureaucratic and rhetorical attitude in dealing with party resolutions." (p 45) Those comrades with bureaucratic style will also rhetorically talk about supporting the line, policies and principles of the party, serving the people wholeheartedly and making contributions to the four modernizations. The problem is that what they say is one thing and what they actually do is another. We must get rid of the bureaucratic style and arouse our revolutionary spirit. We must truly adopt necessary organizational measures, but, what is more important, we must call on every party member and cadre to restore and carry forward the Marxist study style of integrating theory with practice.

Third, they use their power for private ends. This is another significant sign of impurity in the work style of some comrades, and it is also a problem the masses are deeply dissatisfied with and worried about. Comrade Liu Shaoqi repeatedly said that the proletarian nature of our party determines the sole objective of our party, which is to serve the people wholeheartedly. Our party members and cadres must never use their position and power to seek private gain. He pointed out: "Our revolution is not for getting a wife, getting food or getting into the limelight, but for the sake of emancipating the masses. Everything is for the masses; otherwise, the revolution will be meaningless." (p 234) "One must never regard the Communist Party as a narrow clique, like a guild pursuing the interests of its members. Anyone who does so is not a communist." (p 134) He called upon "every party member to use proletarian ideology to combat whatever nonproletarian ideas he has, use the communist world outlook to combat whatever noncommunist world outlook he has, and use the principle of the supremacy of the interests of the proletariat, the people and the party to combat his inadequacy." (p 121) Quite obviously, whether one serves the people wholeheartedly on takes advantage of one's position and power to seek private gain is a question of world outlook as well as a question of Marxist study style.

II

To rectify the style of study, it is imperative to oppose dogmatism and empiricism. Dogmatists reduce revolutionary theory to a rigid dogma. They do not understand that theory comes from practice and must be integrated with practice, and also must be examined and developed in practice. Comrade Liu Shaoqi called these comrades "lame Marxists." Empiricists regard their own narrow experience as universal truth. They do not understand that revolutionary practice cannot be separated from the guidance of revolutionary theory. Therefore, they are unable to stand high or see far, and might even lose their bearings. Comrade Liu Shaoqi called these comrades "crawling Marxists." Dogmatism and empiricism are both characterized by a division between the subjective and the objective and by the separation of theory from practice. They are both subjectivism, and they both run counter to the

Marxist style of practice. Dogmatism and empiricism often depend on, and take advantage of, each other. Just as Comrade Liu Shaoqi pointed out: Dogmatism "can browbeat and mislead many worker and peasant comrades and immature young comrades; even very mature comrades who are very experienced in work but immature in their ability to discriminate in theory, are frequently tricked and captivated by them. Therefore, they can put the party cause in serious jeopardy." (p 299) This analysis made by Comrade Liu Shaoqi in opposing dogmatism and empiricism is identical to the exposition made by Comrade Mao Zedong.

Our party suffered incalculable damages and paid a heavy price as a result of dogmatism and empiricism. Comrade Liu Shaoqi's correct thesis on opposing dogmatism and empiricism was precisely summed up from the historical experiences of our party. This judgment has again been borne out in practice since the smashing of the "gang of four." The comrades who put forward the erroneous policy of "two whatevers" held that the things said by Comrade Mao Zedong were unchangeable. Apart from other factors, judging from their method of thinking, this is also a dogmatic tendency. If some people on the top put forward this erroneous policy, those comrades below whose theoretical foundation was not strong and who simply worked in accordance with the instructions and narrow experiences of those at the higher level naturally blindly followed. This resulted in the situation of 2 years of uncertainty in work. By discussing the question of the criterion of truth and particularly by the work of bringing order out of chaos carried out since the 3d Plenary Session of the 11th CCP Central Committee, the erroneous policy of "two whatevers" has been basically rectified. However, these two erroneous tendencies of dogmatism and empiricism still exist. For example, on the ideological and theoretical front, some comrades have not devoted their main energy to studying the new situation and new problems in the building of socialist material civilization and spiritual civilization, and have not paid attention to theoretically expounding the four basic principles and the line, policies and principles of the party, or to solving the problems in actual work and in the life of the masses. Rather, under the banner of emancipating the mind and breaking through forbidden areas, they have hankered after the ancient bourgeois skeleton and fashionable things of the West and placed blind faith in the foreign dogmas of capitalist countries, as though all academic and cultural things of the Western countries were good. In actual work, some comrades have looked down on theory and showed no interest in Marxism-Leninism-Mao Zedong Thought. They have paid even less attention to conducting a Marxist analytical study of problems in actual work. Consequently, they are unable to break out of the framework of narrow experience, blaze new trails or create new situations. In the examination, promotion and employment of cadres, they have not considered the consciousness and level of Marxism to be an important condition, and have even erroneously regarded some cadres who have theoretical training as "bookworms," as though cadres with a theoretical level will inevitably be dogmatic and incapable of doing actual work.

After the Yanan rectification campaign, Comrade Liu Shaoqi pointed out at the seventh party congress: "Having overcome thought-stifling dogmatism in the party, we must make further efforts to remove the obstacle of empiricism and start a campaign in the party to study Mao Zedong's theory of the Chinese revolution. We may then anticipate a great upsurge of Marxist culture in the party." (p 337) This analysis by Comrade Liu Shaoqi is also applicable to today's situation. In recent years, in opposing the "two whatevers" and in developing the discussion of the criterion of truth, the tendency toward dogmatism has been criticized, but the tendency toward empiricism has still not been properly criticized. At present, some cadres do not understand the policies and principles adopted since the 3d Plenary Session of the 11th CCP Central Committee, and some intellectuals, particularly young people, are suspicious of the four basic principles. All this, of course, has something to do with being divorced from reality, but an even more important reason is the lack of education and training in Marxism-Leninism-Mao Zedong Thought. Therefore, in continuing to oppose dogmatism, we should at the same time pay special attention to the empiricism which looks down on theory. Starting with the leadership organs and cadres, we should urge the broad masses of party members and cadres to conscientiously study Marxism-Leninism-Mao Zedong Thought.

To rectify the style of study, it is also imperative for there to be no discrepancy between words and deeds. What Liu Shaoqi meant by no discrepancy between words and deeds was: "Their speech is Marxist and their actions are also Marxist." (p 296) This requires our party members and cadres to always adhere to the Marxist world outlook of dialectical materialism and historical materialism, conform to the norms of communist ideals, conviction and morality, and use them to guide our words, deeds, work and lives. Only in this way can we play the role of vanguards of the proletariat in socialist modernization. Otherwise, we will become divorced from the party and people and make this or that kind of mistake. The people are most realistic, and they often appraise our party by the actual actions of the party members and cadres. Therefore, whether there is an accord between words and deeds among the party members and cadres has a powerful influence on the masses. Some of our comrades talk Marxism and also preach Marxism to others, but their actions are not Marxist. What they preach to others is Marxism, but what they practice is individualism and liberalism. This has damaged our party's image among the people.

The Marxist style of study requires us to seek truth from facts, to be loyal and honest, to speak the truth and to be pragmatic in work and opposes the unhealthy style of indulging in empty talk and using high-flown words. Engels said: "All revolutionary high-flown words and clamoring will inevitably lead to defeat." ("Collected Works of Marx and Engels," Vol 36, p 540) Comrade Liu Shaoqi said: "Certainly we must study theory, but we also practice what we learn. The study is for the sake of practice." (p 111) In accordance with this teaching, we must study Marxism, practice Marxism, make words accord with deeds and think and act in a unified way to set a good example for the masses, and lead all the people in progressively and solidly fostering a fine social atmosphere.

III

For the sake of rectifying study style, it is also imperative to adopt effective measures in the direction of organizational leadership.

First, we must organize the party members and cadres to conscientiously read books. Comrade Liu Shaoqi said: "Party members must bury themselves in books and studies. This is not an expression of the 'academic school,' but what every party member engaged in the study of Marxism-Leninism must do. Anyone who is more accomplished in Marxism-Leninism must go through this stage of burying himself in books and studies. This was particularly the case with Marx and Lenin." (p 219) Comrade Liu Shaoqi on many occasions mentioned that for most party members, inadequate theoretical training was a great shortcoming of our party, and this led to mistakes in guiding ideology on several occasions in the democratic revolution. In the 30 years and more since the founding of the People's Republic, we have also encountered setbacks and the 10 years of internal disorder. These have likewise been caused by mistakes in guiding ideology as a result of mistakes in theory. At present the CCP Central Committee has already correctly summed up the historical experiences and accomplished the historical task of bringing order out of chaos in the guiding ideology of the party. However, to enable our whole party to properly digest and assimilate these experiences and accomplish the historical task of bringing order out of chaos in the thinking and work style of the whole party, we must also advocate the conscientious reading of books and the comprehensive and accurate mastering of the basic principles of Marxism-Leninism-Mao Zedong Thought. In the first half of this year, our party members and cadres of Shaanxi must continue to master politics and economics in accordance with the arrangements of the Central Committee. Beginning from the second part of the year, they must conscientiously study Marxist philosophy, further enhance their consciousness and level of Marxism in world outlook, and unify their understanding and action.

Second, we must correctly develop criticism and self-criticism. At present, there are many problems in party style and study style. How can we solve them? We must conscientiously take up this weapon of criticism and self-criticism. Comrade Liu Shaoqi laid special emphasis on self-criticism by the leadership cadres. He pointed out: "Experience proves that wherever a comrade in a responsible position seriously practices sincere and necessary self-criticism before the party membership and the masses, criticism and self-criticism by the people and the party membership, they will also develop, their enthusiasm will be heightened, their internal solidarity will develop, their work will improve and their defects will be overcome. At the same time, the prestige of the responsible comrades will increase instead of being undermined." (p 364) Therefore, whether criticism and self-criticism can be properly developed has a great deal to do with whether the party members and leadership cadres have the spirit of conscientiously carrying out self-criticism. Leadership cadres of our party at various levels must set the pace in carrying out self-criticism in daily political life for the purpose of rectifying their study style and party style.

Third, we must carry out thoroughgoing investigation and study under the guidance of Marxism-Leninism-Mao Zedong Thought. Comrade Liu Shaoqi said: "To authentically reflect conditions and independently make decisions, we must go everywhere to look and make inquiries, and we must read the works of Marx and Lenin and do a great deal of research." (p 405) In the last 2 years, there has been a great interest in investigation and study with the impetus given by the leading comrades of the Central Committee. However, judging from conditions in Shaanxi, there is still not enough investigation and study with the leadership comrades personally taking a hand in the work, especially in the direction of economic work. Even if certain investigations have been carried out, they are mostly sporadic and perfunctory and seldom thorough and meticulous. More attention has been paid to investigation and less attention has been paid to study. There are many problems which have been posed by understanding conditions but there have been few schemes based on serious analysis, proposed for solving problems. Comrade Chen Yun has called on our leadership organs and leadership comrades at various levels to devote more than 90 percent of their time to investigation and study and less than 10 percent of their time to policymaking. Our local party committees should devote more than 90 percent of their time and energy to inspecting and directing the implementation of party policies and principles and less than 10 percent of their time and energy to making arrangements for work. Only in this way can we improve our level of Marxist leadership and can we propose and implement plans, schemes and measures consistent with objective reality and effectively fulfill various tasks of the party.

Fourth, we must use the criterion of integrating theory with practice to examine theoretical study by party members and cadres and set up the necessary system of rewards and penalties. The principal content of the examination is to judge whether the cadres can use Marxism-Leninism-Mao Zedong Thought in directing their own words, deeds, work and lives. As Comrade Mao Zedong and Comrade Liu Shaoqi repeatedly stressed, we must regard the ability to understand and implement Marxism as an important condition in the selection and employment of cadres. Comrades who do not study or who have not done well in studying Marxism-Leninism-Mao Zedong Thought, and whose words and deeds are at complete variance, should be criticized and should not be allowed to hold important posts. Those who are diligent in their study and can correctly adjust their deeds to their words should be commended, rewarded and promoted.

At this historical turning point, fresh study is of especially great significance. Comrade Liu Shaoqi said: "How can we rectify our past mistakes? All comrades should study. They should study past experiences, study the theories of Marxism-Leninism and study the methods of Marxism-Leninism. Only in this way can we go forward." (p 71) I am of the opinion that as long as we do as Comrade Liu Shaoqi said, we will certainly be able to restore and carry forward our fine party style and study style and keep on scoring fresh triumphs in our socialist modernization.

HOW DOES THE CAPITAL IRON AND STEEL COMPANY CARRY OUT ITS ECONOMIC RESPONSIBILITY SYSTEM?

Beijing RED FLAG in Chinese No 6, 16 Mar 82 pp 14-20

[Report by the joint investigation team of the System Restructuring Office and the Economic Research Center under the State Council]

> [Text] Editor's note: The Capital Iron and Steel Company has achieved remarkable results in carrying out its economic responsibility system and has thus provided us with valuable experience in perfecting the economic responsibility system in our industrial enterprises and promoting the overall reorganization of our enterprises. In the Capital Iron and Steel Company, the economic responsibility system has been carried out in combination with fulfilling in an overall manner the state plan, and thus the relationship between the interests of the state and the enterprise has been correctly handled. By combining the implementation of the economic responsibility system with the improvement of administration and management, the company has correctly handled the relationships between all its sectors. Moreover, by combining the implementation of the economic responsibility system with the carrying out of the principle of distribution according to labor, the company has correctly handled the relationships among its staff members and workers. All localities should pay attention to learning from the experience of the Capital Iron and Steel Company in carrying out the economic responsibility system.

The Capital Iron and Steel Company is a large-scale iron and steel integrated complex. It is one of the key enterprises where the expansion of enterprise decisionmaking power was first carried out on a trial basis. Over the past few years, the various basic tasks in the enterprise have been strengthened, the system of personal responsibility has been restored and perfected, and production management has been improved. This was especially true during the latter half of 1981, when the company established the economic responsibility system that combined responsibility, power and interests and brought about another great change in the enterprise. As a result, the broad masses have become more concerned for their enterprise, their sense of responsibility as masters of their enterprise in making greater contributions to the state has been intensified, and their spirit in cooperating in a united manner and in striving to scale new heights has further developed. Improving the administration and management has become the conscious demand of the staff and workers. They have done a better job in carrying out and improving the original managerial system and have succeeded in shifting the focus of the production and management activities of the enterprise onto improving economic results, resulting in a remarkable rise in the economic results of their enterprise. For example, during the first half of 1981, their monthly profit averaged 23 million yuan, and from August to December of that year the profit of each of the 5 months exceeded 30 million yuan. Thus they set a new record of the amount of yearly profit that they handed over to the state. Among the 52 comparable technical economic indexes, 30 have been raised to the advanced domestic level and 6 to the international level.

In carrying out the economic responsibility system, the Capital Iron and Steel Company has followed a correct orientation and a correct path and has thus achieved good results. It has provided very useful experience in establishing and perfecting the economic responsibility system and we should attach importance to its experience.

I. Giving Priority To Fulfilling in an Overall Manner the State Plan

In the course of implementing the economic responsibility system, it is an important matter of principle for an enterprise to ensure the overall fulfillment of the state plan. In 1981, owing to the needs of readjusting the national economy, the Capital Iron and Steel Company was required by the state plan to reduce its output of iron and steel by 360,000 tons less than that of 1980. This meant a cut of 4.7 percent in steel output and a cut of 7.6 percent in iron output. Nevertheless, the state plan also demanded an increase in the profit to be handed over to the state by 270 million yuan, which was 22 million yuan more than that in 1980. Faced with these contradictory requirements, what should the company do? Should it insist on changing the state plan by stressing the difficulties, or should it consciously shoulder the responsibility and conscientiously find ways to fulfill the plan? After repeated discussions, the CCP committee of the company was of the opinion that fulfilling the production plan and financial tasks of the state is an unshirkable duty for a socialist enterprise, and that people had to fully estimate the latent potential in the enterprise as well as the difficulties in fulfilling the tasks. It mobilized the masses to make budgetary calculations in 18 respects, organized them to analyze the favorable conditions for the production of the enterprise and to do research on ways to increase income and cut expenditure. By so doing, it made them see the possibility of fulfilling the plan and imbued them with confidence in overcoming the difficulties and in completely fulfilling the state plan.

How did the Capital Iron and Steel Company completely fulfill the state plan?

In arranging their production, they have not blindly pursued profit but strictly produced each kind of product in accordance with the state plan whether it was in excess or short supply and whether it was profitable or unprofitable. Regarding products in excess supply, the company has resolutely carried out the plan for reducing their output. In 1980, it reduced its iron output from 2.94 to 2.65 million tons and cut its steel output by 70,000 tons. As for products in short supply, such as pig iron for civilian use, which had only a small profit margin but for which there was an urgent demand in society and for which the state required the company to double the output, the company resolutely fulfilled the plan for increasing its output. It did this despite the fact that pig iron for civilian use was 70 yuan lower per ton in price than iron for use in steel production, and that the fulfillment of the planned target for its production would result in a 2 million yuan reduction in profit.

Where the implementation of the state plan for reducing output might cause a corresponding reduction in profit, in order to ensure the fulfillment of the financial task of handing over profits, the Capital Iron and Steel Company did not copy the malpractices of some backward enterprises that adopted means other than improving administration and management and tapping the potential of the enterprise. Instead it persisted in obtaining income by appropriate means and through proper channels and in conscientiously finding ways to make up for the possible deficit in fulfilling the state plan. First, it tried by every means to conserve energy, reduce the consumption of raw materials, save on various expenditures and vigorously lower production costs. In producing a ton of iron, it used only 514 kilograms of coke, which was 56 kilograms less than the 570 kilograms of coke consumption stipulated by the state. In producing 1 ton of steel, it used only 1,870 kilograms of standard comprehensive fuel, which was 230 kilograms less than the 2,100-kilogram consumption level stipulated by the state. During the latter half of that year, it reduced costs by 5.48 percent after a 3.08 percent rise in the first half of that year over that of the same period the year before, and thus achieved a 2.4 percent net reduction for the year, resulting in a 13 million yuan rise in profit. Second, it conscientiously investigated the market, readjusted its product variety in accordance with market demand, changed the orientation of its services and produced marketable products. At the same time, it vigorously marketed products that had been produced according to the plan but could not be allocated to customers in accordance with the plan. It reprocessed the 192,000 tons of iron it had produced without a contracted buyer and turned the iron into marketable steel billets and steel products. Last year, it sent its staff to 25 provinces and cities to conduct investigations on the steel products needed in manufacturing bicycles and found that there was an urgent demand for strip and slab steel. It supplies the steel for 12 million pairs of wheels to 15 manufacturers of bicycle spare parts. It also signed contracts with 30 manufacturers of bicycles and of bicycle spare parts in 10 provinces and cities for supplying 12 varieties of steel and sold more than 11,000 tons of steel to them. It expanded the sizes of iron pipes it manufactures from 3 to 7, and supplied 17,000 tons of iron pipes to 68 water and gas companies during the latter half of that year. These iron pipes constituted 40 percent of the nation's total output of iron pipes in that period. Throughout last year, the company marketed 14.8 percent of its products. This caused a 20 million yuan rise in profit. Third, it utilized its surplus manpower and technical superiority to open up new prospects for its production. For example, it produced steel structures for housing construction in rural areas and contracted for performing the tasks of processing and overhauling. This caused a 4 million yuan increase in profit. By adopting the above means of saving on expenditures and increasing income, it raised its profits by more than 40 million yuan. As a result, its profits totaled 314 million yuan last year, which was 29 million yuan or 8.2 percent more than in the previous year.

In balancing the interests of the state and the enterprise, the Capital Iron and Steel Company always gave priority to the interests of the state and adhered to the principle of ensuring that the state would get the larger share of the extra profit. In 1981, the profit handed over to the state increased by 8.9 percent over that of the previous year, the profit transferred to the company's reserve funds increased by 7.9 percent, and the profit allocated to the bonus funds for its staff and workers increased by 2.4 percent. The increase in the state's share of the profits exceeded that of the enterprise and that allocated for bonuses. What the state obtained from its increase in profits in 1981 over 1980 was much more than what the company obtained.

The practice in the Capital Iron and Steel Company has proved that so long as we correctly treat the relationships between the interests of the state, the enterprise, and the staff and workers as individuals, and so long as we give full play to the initiative of the enterprises, we will be able to combine the implementation of the economic responsibility system with the intensification of planned management. At the same time, the company has also proved that, under the premise of ensuring the fulfillment of the state plan, the implementation of regulation by market mechanism within a certain scope and the increase of the output of the products needed in the market even by such a large-scale enterprise as the Capital Iron and Steel Company not only will not cause confusion in fulfilling the state plan, but will provide the necessary supplement to the state plan.

II. Implementing the Economic Responsibility System Level by Level Within the Enterprise

In order to ensure that the company discharges its economic responsibility to the state, it must implement the economic responsibility system level by level within the company to combine the interests of the staff and workers with their responsibility and thus make overall fulfillment the common aim of struggle for all staff and workers.

What characterized the Capital Iron and Steel Company's implementation of the economic responsibility system level by level?

1. Allocating the economic responsibility of the company level by level to all its departments and sectors: In the Capital Iron and Steel Company, it was stressed that the economic responsibility system could not really be

regarded as implemented unless the implementation involved specific persons. If a department failed to implement the economic responsibility system in the sectors at its lower levels, it would not be able to discharge its economic responsibility. The company first allocated its economic responsibility to the factories and mines under the company. It required them to do the following things: 1) fulfill the targets assigned to them concerning the number of personnel, profit and increase in profit; 2) ensure the fulfillment of the targets and tasks concerning quality, varieties, contracts, consumption, costs, employment of floating capital, safety in production, protection of the environment and trial-production of new products; and 3) ensure the implementation of coordination inside the company and the fulfillment of the work requirements. While stipulating the economic responsibility of its factories and mines, it adopted the method of transferring part of the profits of the factories and mines to their reserve funds so as to combine their responsibility and power with their interests. Furthermore, the factories and mines allocated their economic responsibility to their workshops, then to their groups and teams, and finally to every staff member and worker. Not only the departments that directly took part in production but all the functional offices have established the system of personal economic responsibility. The main content of this system is: 1) basic duties and work quotas based on professional division of labor; 2) specific tasks performed in conformity with the general tasks of the company; 3) requirements in cooperation and coordination; and 4) development of the basic professional capacity of the offices and the temporary tasks assigned by the leadership. Thus, every department and sector, whether it is a production unit or a functional office and whether it is on or behind the frontline, has been assigned its corresponding responsibility in accordance with the requirements resulting from the relationships and coordination between various production sectors. Every person, whether he is a worker or a cadre, has been assigned in the same way. The system of personal economic responsibility has been established in all the 31 major factories and mines, the 31 offices and the 242 workshops, and for 98 percent of its workers. As a result, the company has become an organic, integrated entity with close links.

2. Persisting in assigning advanced and rational targets to all its production and administrative units and to all its staff and workers: The economic and technical indexes in the Capital Iron and Steel Company are advanced domestically and some of the indexes are even advanced internationally. Under such circumstances, the company has relied on the masses to carry out careful investigation and make scientific forecasts, and thus has succeeded in persisting in assigning advanced and rational targets. Moreover, it has placed even more exacting requirements on its units and people. For example, in 1980 the proportion of coke for the blast furnaces in its ironworks was 443 kilograms. During the first half of 1981, it dropped to 420 kilograms, which was already an advanced index domestically. During the latter half of 1981, when the economic responsibility system was being established, the target was further reduced to 408 kilograms. At the same time, it was required that more than 99.5 percent of the iron produced should be up to standard, that the costs of iron should be reduced by 2.2 percent and that there should be no breaches of contract. All the ironworks succeeded in

meeting these requirements. Furthermore, the proportion of coke dropped to 398 kilograms in the fourth quarter of 1981, and 99.9 percent of the iron produced was up to standard. The establishment of advanced and rational targets encouraged the people at all posts and in all sectors to do their best to choose and employ the best technology, the best operations and the most efficient management possible in order to achieve the aim of increasing economic results. By so doing, they promoted the widespread development of the movement of rationalization proposals and technical renovation and boosted the technical reform of the enterprise. For example, the heavy oil consumption index for the heating furnaces in medium-sized and small steel rolling mills was 22.6 kilograms during the first half of 1981, but the target assigned by the company for the latter half of 1981 was only 20 kilograms. Without technical renovation, it would be hard for them to attain this target. They applied their wisdom and were determined to find a way out by technical renovation. They substituted gas for heavy oil in heating the steel from below, and thus reduced the heavy oil consumption from 10 to 15 kilograms, resulting in a savings of 5,000 tons of heavy oil per annum.

3. Being strict and fair in assessing performance and meting out rewards and punishments: In order to ensure the attainment of the various advanced and rational economic technical targets, the company had to be strict in assessing the performance and be strict and fair in meting out rewards and punishments. Otherwise, the system of personal responsibility would remain only on paper and could not be really implemented. Strict assessment of performance and strict and fair rewards and punishments must be scientifically based. For this purpose, the Capital Iron and Steel Company has established and perfected in an all-round manner its basic work. Using a series of quotas, measurements, original data and statistics, the production results of each post have been calculated in a fairly exact manner. At all its factories and mines, a statistical system was set up to record the performance of every worker, which is publicized daily, analyzed weekly and summed up monthly. An assessment handbook has been introduced to record daily each cadre's performance at his post. The handbooks have to be signed and marked weekly by the leaders at a higher level, and rewards have to be meted out monthly in accordance with the marks.

After the establishment of the assessment system, there was still the problem of whether people were courageous enough to carry it out. The Capital Iron and Steel Company has adhered to the principle of everybody being given an equal standard in performance assessment. All delinquents should be strictly punished without exception, and the practice of avoiding hurting anybody's feelings should be eliminated. The company's clear and definite performance standard, strict assessment system, and strict and fair methods in meting out rewards and punishments has guaranteed the implementation of the economic responsibility system.

The experiences of the Capital Iron and Steel Company has proved that only by persisting in making the targets advanced and rational, in fully implementing the economic responsibility system level by level, and in being strict and fair in assessing performance and meting out rewards and punishments can we mobilize the masses to combine the implementation of the economic responsibility system with the all-round improvement of administration and management. Thus we will be able to tap the internal potential of the enterprises and raise the economic effect.

III. Overcoming Egalitarianism in Distributing Bonuses

In order to implement level by level the economic responsibility system inside an enterprise, we should link the degree of responsibility that a specific staff member or worker is charged with and the results of his labor with the economic results of the enterprise. We should also overcome egalitarianism in distributing bonuses and conscientiously implement the principle of distribution according to labor so as to give full play to the initiative of all the staff and workers.

In distributing bonuses, the Capital Iron and Steel Company has adhered to the following three principles:

1. Resolutely controlling the total amount of bonuses in accordance with state regulations: Over the past 3 years, the profits of the Capital Iron and Steel Company increased at an average annual rate of 22 percent. However, the company strictly carried out the relevant stipulations that were laid down by the higher level in deciding the total amount of bonuses. In 1981, the Beijing Municipal People's Government gave the company permission to pay a maximum total yearly bonus as much as the standard wage for 3 months (this was the highest bonus level that had ever been allowed in Beijing), under the condition that the company fulfill the tasks of reducing production and increasing income. In order to control the total amount of bonuses, the company adopted the method of paying a conservative amount of bonuses in advance every month so as to have leeway in paying the rest of the bonuses at the end of the year. Every month all the units in the company have to report to the company on the amount of bonuses they plan to pay, and the company then carefully examines them one by one. If the amount is planned in strict accordance with the regulations and within the limit of the maximum amount that the company has stipulated, the company will give permission for payment; if not, the company will not give permission. Every month the company transfers 5 percent of the allocated amount of bonuses to its bonus fund reserve, and all the factories and mines in the company also transfer a part of the allocated bonus funds to their reserve funds instead of completely paying them out. Last year the monthly bonus for each person throughout the company averaged 12.8 yuan, which meant that the average bonus for each person last year was equal to the standard wage for 2.9 months. The bonus that was paid to each person in its production factories and mines averaged 13.2 yuan per month, which meant that the average bonus for each person last year was the equivalent of the standard wage for 2.99 months. Over the past few years, the Capital Iron and Steel Company has transferred a total of 95.7 million yuan of its allocated bonus funds to its bonus fund reserve. Some of this money will be used to fund housing for its staff and workers, and the remainder will be kept in reserve and will be used to cover any possible deficits in future allocated bonus funds.

2. The bonuses of the staff and workers are linked with the economic results of their collectives and should be adjusted upward or downward accordingly. In the company there is a stipulation related to bonus payment that if the factory, mine or office fails to fulfill the task that the company has assigned to it, no one in it will get any bonus; and that if a workshop, group or team fails to perform the economic responsibility that the factory or the mine has assigned to it, no bonus funds will be allocated to it nor will any person in it be paid any bonuses. The monthly bonus that the same person gets in the same unit fluctuates in accordance with how the unit fulfills its monthly task. For example, in the company's ironworks sometimes the average monthly bonus for each person reached as high as 24 yuan, but sometimes it dropped to as low as 10.5 yuan. During June and July of last year, the ironworks failed to fulfill its tasks; therefore, no one there was paid any bonuses. This stipulation encourages everyone to be concerned about his group or team, every group or team to be concerned about the workshop that it belongs to, every workshop to be concerned about the factory or mine that it belongs to, and all the units to be concerned about the company. As a result, all the staff and workers in the company are concerned about the fulfillment of the targets that the company is striving for, and the units and people at all levels strive to increase economic results. The company is using the common economic interests as a tie to closely link all its production sectors, and thus ensure its internal coordination and its final achievement of the goal of increasing economic results. As the workers there said, "This method of bonus payment means a team competition as well as an individual competition."

3. Acknowledging differences and reasonably dividing bonuses into grades: In order to overcome egalitarianism, we should, in paying bonuses, take into account the differences in the nature of the posts, in work attitude, in technical skill, in working capacity and in achievements. First, bonus payments should vary from unit to unit. The constant and coefficient in the formula for calculating bonuses for the company's offices has been set by taking into account the difference in the importance of their economic responsibility. The formula for calculating bonuses for the company's factories and mines takes into consideration their importance in production, the levels of their economic and technical indexes, their managerial standards and their work conditions. Second, bonus payments should vary for individuals. The constant and coefficient in the formula for calculating the bonuses for individuals have also been set by taking into consideration the difference in the responsibility of the cadres, the difference in importance of the workers' posts, in their technical skill, in the intensity of their labor and in their work conditions. Thus the bonuses for every unit and every individual fluctuate in accordance with how tasks have been fulfilled. Considerable rewards and heavy punishments have especially been stipulated for key posts, weak sectors and key problems that must be solved. By so doing, the company has fairly satisfactorily overcome the egalitarianism in distribution among its units and among its individuals. According to statistics for a certain month, in its 20 factories and mines, 10.37 percent of the staff and workers received a bonus of 25 yuan or more; 68.14 percent received a bonus from 11 to 24 yuan; 13 percent, 10 yuan or below; and 8.49 percent received nothing.

The experience of the Capital Iron and Steel Company has proved that so long as we reasonably draw up the standard for assessing bonuses under the condition of controlling the total amounts of bonuses within a prescribed limit, so long as we publicize the formula, constants and coefficients by which we calculate the bonuses, and so long as we strengthen our ideological and political work, we will be able to put an end to the practice of "eating out of the same big pot," overcome egalitarianism, and integrate the implementation of the economic responsibility system with the principle of distribution according to labor by allowing reasonable disparities in bonuses. We will also be able to give play to the positive role of bonuses in encouraging the advanced and spurring on those who lag behind, and avoid and overcome the negative role of bonuses, thus fully mobilizing the initiative of the staff and workers.

IV. Boosting the Overall Reorganization of the Enterprise

Over the past few years the Capital Iron and Steel Company has done a great deal of work in reorganizing the company and has achieved great results. The implementation of the economic responsibility system put new demands on the various tasks of the company. People in the company have focused their efforts on increasing economic results while continuously paying attention to the work of reorganizing the company. As a result, they have raised the administration and management in the company to a new level. They have paid serious attention to the following things:

1. Reorganizing the various kinds of professional managerial work: For many years, the company's planning was invariably related only to production, technology and finance. As a result, in formulating plans the company paid attention only to production and neglected management, and it blindly pursued high output and neglected economic results. Along with the establishment and implementation of the economic responsibility system, the company first reorganized and reformed its management of planning and then included its production, technology, accounting, purchasing and marketing into comprehensive production and management planning. Thus the company began to organize all its activities related to production, technology, administration and management and formulated a planning system that is, in depth and scale, far more comprehensive, detailed, concrete, harmonious and thorough than before in order to actually carry out the state plan and to bring the company onto the path of increasing its economic results.

According to the above-mentioned requirements, the company not only arranges its production monthly or weekly, but at the same time also arranges for the fulfillment of tasks concerning marketing, costs and profit growth. The business of the control room in the company has been extended from solely controlling production to mastering the comprehensive changes in production, delivery of goods, marketing, profit and costs. It draws up a production and management plan every day and strictly examines its fulfillment. The purchasing work has changed from solely ensuring supplies to paying attention to management in making the best choice of purchases by comparing the prices of different suppliers. In the past the company's marketing was mainly concerned with carrying out procedures related to deliveries of the goods it sold, but now the marketing department has begun to pay visits to customers, to serve the customers where they are, to make investigations, analyses and forecasts about the market and to supply information to the planning department. The accounting work has also changed: analyses and forecasts are made beforehand to promptly provide information for the decisionmaking of management instead of merely keeping historical accounts. Cost management has also been developed and has become the integration of professional management with mass management, and it is an all-round cost management with the participation of the masses. The standards of all professional managers have been raised to new heights.

In order to achieve the economic goals of the entire company, the relationships between all departments have also changed. For example, in order to garner 312 million yuan of profit in 1981, the company had to ensure that during the last 4 months more than 9,330 tons of its products were sent out every day: 220 railroad freight cars were used every day and 1 million yuan was earned every day. This demanded close coordination and cooperation of the work in all departments in the company, including planning, controlling, producing, accounting, purchasing and marketing. This also required putting an end to the old practice of each professional management department going its own way and shifting responsibility onto another. Thus a fairly vigorous command system of production and management has taken shape under the leadership of the company's manager.

2. Reorganizing the basic work of the enterprise: In implementing the economic responsibility system, they have strengthened their data management in addition to continuously perfecting and improving various regulations and systems. Data are the basis on which the enterprise analyzes, readjusts and controls its production. Technical and managerial activities are also the basis on which it carries out the strict examination and assessment of performance and on which it carries out distribution according to labor. Since establishment of the economic responsibility system, the company has decided to strengthen its data management. They have vigorously reorganized the work of taking measurements and the work of making source documents, and have also reorganized the quota management. Moreover, they have designed a series of shop record forms and other forms for assessing performance in implementing the economic responsibility system and have established a general office of statistical control. Throughout the company, they must manage 80,000 pieces of information and have gradually established a data management and feedback system. At the end of 1981, the proportion of raw materials and fuel that the company checked the weight of when it received them was raised to 99.3 percent from 57.7 percent, and meters were installed to measure 95.22 percent of the company's consumption of electricity, steam, oxygen, nitrogen, coke-oven gas, blast-furnace gas and compressed gas. This meant that they had made significant progress in developing scientific management.

3. Reorganizing its management of labor and fixing a standard number of personnel in every department in organizing production: In reorganizing its structure the company stressed that every worker or cadre had to work "with high efficiency and to the best of his ability" in order to make more

contributions to the motherland. Having quite a few redundant personnel, the company has persisted in fixing a standard number in every department in accordance with production needs. It has made a clear distinction between the staff and workers employed in the state-owned enterprises and the collective enterprises under it and has refrained from appointing any state-employed persons to collective posts or vice versa. It has refrained from appointing the children of its retired workers to their parents' posts, but has trained them, examined them and appointed them according to their abilities under the unified authority of the company. In order to find out where the company has employed excessive personnel, the company has organized a technical assessment group, which has drawn up the standard number of personnel for every part of the company by recording the job activities and measuring the time these activities take and by sampling. From 1978 to 1981, the company found that 8,700 of its personnel were redundant, which was 12 percent of the present number of the company's personnel. By trying every means to find employment for these redundant personnel, the company succeeded in appointing them to new posts that served the production and the livelihood of its staff and workers. This reorganization of the company's work force through fixing standard numbers of personnel and strengthening work discipline facilitated the implementation of the economic responsibility system.

4. Reorganizing and improving the leading groups: The reason why the Capital Iron and Steel Company can successfully implement the economic responsibility system level by level lies in the company CCP committee's conscientious reorganization and improvement of the leading groups at all levels. It has promptly promoted to leading posts at various levels the cadres who have been able to conscientiously carry out the party's principles and policies, who understand production and who know management well. At the same time, it has promptly helped and educated and even demoted the cadres who have fallen short of the demands of the new situation and of the new tasks. By so doing it has adhered to the principle that cadres can be demoted as well as promoted. At present, among the 419 leading cadres at the factory and bureau levels, 70 percent have received education above the junior middle school level and 46 percent have been granted professional titles. The average age of the 419 cadres is 50.1 years. The company's leading groups are fairly crack and strong groups.

The experience of the Capital Iron and Steel Company proves that the reorganization of an enterprise will create favorable conditions for implementation of the economic responsibility system, and that the implementation of the economic responsibility system will in turn promote the overall reorganization of the enterprise. So long as we integrate the implementation of the economic responsibility system with the overall reorganization of an enterprise and so long as we give priority to improving and perfecting the economic responsibility system in reorganizing our enterprises, we will be able to lead the staff and workers in our enterprises onto the path of improving administration and management and raising economic effect.

V. Vigorously Strengthening Political and Ideological Work

The implementation of the economic responsibility system is an important reform in the administrative and managerial system in our industrial enterprises. Every step in improving the system involves the correct handling of the relationships between the interests of the state, of the enterprises, of the departments inside the enterprises, and of the staff and workers. Therefore, various ideological problems and various problems of understanding will inevitably crop up. In implementing the economic responsibility system and in paying attention to material incentives, we should never abandon the principle of giving priority to ideological work nor slacken our efforts in doing political and ideological work. At the beginning of the establishment of the economic responsibility system, the company clearly set forth the tasks of building the two civilizations by achieving good results both in increasing economic results and in inspiring the revolutionary spirit of its staff and workers.

In conducting political and ideological education the company has done the following things:

First, it has corrected people's understanding of the economic responsibility system. When the economic responsibility system had just been established, some cadres and masses did not understand the system. Therefore, some of them had doubts about it and resisted it, thinking that "establishing the economic responsibility system in an industrial enterprise means using the methods of small production in developing large-scale production and that this means a retrogression." Others were of the opinion that "this system is neither socialist nor capitalist and therefore will not work." There were also a few cadres who thought that the economic responsibility was nothing but shouldering the assigned responsibility for profits and bonuses. As a result, they endlessly haggled in fixing the assigned quota and the bonuses. In order to solve these ideological problems, the company conducted education in the aims and significance of the economic responsibility system. Through study and through listening to the explanation of the aims and significance of the system, all the staff and workers in the company began to understand that in carrying out socialist large-scale production, they had to establish a strict responsibility system to ensure the normal operation of production. This is precisely the demand of large-scale production. Through studying the resolution of the 6th Plenary Session of the 11th CCP Central Committee, which summed up both the positive and the negative experiences in the past 30-odd years, they have begun to understand that the past practice of "eating out of the same big pot" and engaging in egalitarianism did not comply with the principles of socialism and that only by implementing the economic responsibility system and the principle of distribution according to labor and by acting in accordance with objective laws, can we really achieve socialism. On the other hand, they have also begun to understand that the economic responsibility system does not merely mean shouldering the assigned responsibility for making profits, but it is an enterprise managerial system that combines responsibility, power and interests under the guidance of state planning. By conducting these educational activities, the company has succeeded in teaching its broad ranks of staff and workers to have a relatively correct understanding of the aims and significance of the economic responsibility system.

Second, the company has conducted education on correctly handling the relationships between the interests of the three parties. In this respect, some staff members and workers had some muddled ideas. They thought that "it is better for the quota to be fixed as low as possible in order to get more bonuses." Some of them even upheld the practice of "paying out all the bonus funds," and were of the opinion that they would suffer if the company complied with the regulations in paying bonuses. In order to correct these erroneous ideas, the company has conducted various forms of education to teach its staff and workers to understand the country's economic situation and to teach them to put the interests of the state first and make greater contributions to the state. In the company's sintering plant, the management used the figures in the state budget report of the Ministry of Finance to give the staff and workers the following account: In 1980, the state spent more than 20 billion yuan in providing various kinds of subsidies, from which each staff member or worker was benefited to the extent of more than 400 yuan a year. This meant that in 1980 the state spent a total of 26 million yuan in providing subsidies for the staff and workers in the company. This account made the staff and workers understand that state revenues are drawn from the people and used for the people and that the fundamental interests of the state, of the collective and of the individual conform with one another. Therefore, the enterprise had to make greater contributions to the state. By comparing the ratios of increase in labor productivity with the ratios of increase in bonuses and by comparing the ratios of increase in the purchasing power of the community and the ratios of increase in supply of goods, it taught its staff and workers to understand the reason why the amount of bonus payments should be controlled. Thus they fixed in people's minds the idea that "one has to strive to make greater contributions and should not haggle for more bonuses."

Third, the company has conducted education on taking the whole situation into account. After establishment of the economic responsibility system, there were a few units that paid attention only to striving to obtain more bonuses for themselves regardless of the interests of the whole company and the demands of the whole situation. There were also comrades who worried that the establishment of the economic responsibility system would give rise to a tendency of "each striving for his own interests in the manner of everyone for himself and let the devil take the hindmost," and then the company would become a complex that existed in name only. In order to correct these wrong ideas, the company has taught its staff and workers to take the whole situation into account and to correctly handle the coordinated and cooperative relationships between different sectors inside the company. Only when the staff and workers know how to take the whole situation into account and to correctly handle the coordinated and cooperative relationships between different sectors can harmony between various items of work in the company be ensured and can comprehensive economic results be achieved. The motive power plant has organized its staff and workers to make the following calculation: If the plant blindly lowers its expenditures and causes a drop in the pressure of compressed gas below standard, this will cause a loss of

760 yuan per minute to the pipe-welding plant, a loss of 1,530 yuan per minute to the Nos 2 and 3 blast furnaces, and a loss of 200 yuan per minute to the pilot plant. This calculation made the masses see that they should not restrict their calculations to what they can save on in their own unit, but they should also conduct the even more important calculation of the impact of their activities on other units and on the whole situation of the company. Thus the masses have become more conscious in intensifying their unity and coordination with other units.

In conducting political and ideological work, the company not only relies on a small number of propaganda cadres, but also mobilizes the ranks of its party members and key staff members and workers to take part in the work. In the company, there are 93 report writers at the factory or bureau levels and 2,018 propagandists who are not withdrawn from production. These report writers and propagandists have written as much as 210,000 characters of propaganda material. The company CCP committee requires its party members to play the exemplary role of pioneers and to do a good job of conducting political and ideological work in their groups and teams. It has also given play to the role of the worker congresses in making the staff and workers take part in the company's decisionmaking on major issues related to planning, production, benefits and distribution and in making them concerned with the collective and the factory.

The experience of the Capital Iron and Steel Company proves that in implementing the economic responsibility system, we can by no means weaken our political and ideological work. On the contrary, we should strengthen it. Therefore, the political and ideological work is and will forever be the lifeline of our economic work. Political and ideological work must be integrated with economic work and only thus can the economic responsibility system be developed healthily.

The company's basic work in enterprise management is in relatively good order and its managerial standard is relatively high. It has favorable conditions for implementing the economic responsibility system. The key reason why it has achieved remarkable results in implementing the economic responsibility system lies in its having a strong leading group that is able to correctly understand the aims and significance in implementing the economic responsibility system and to conscientiously carry out the party's policies and principles. As the economic responsibility system was implemented a short time ago, in some units of the company the system has not yet been carried out well, and some measures the company has adopted to implement the system need to be further improved. Moreover, the company should continue to improve its manner in handling its relations with the state. What form of distribution of profit should be adopted in a large-scale complex like the Capital Iron and Steel Company, which is mainly conducting its production according to the plans of the state that are in the nature of directives? What is the rational limit to the proportion of profit that a large-scale enterprise can retain for its own disposal? These questions and a number of other questions such as those related to the division of authority in the company and those related to the limit of the powers of its factories and mines, are to be solved through carrying out practical research.

THE SCIENTIFIC THEORY OF SOCIALISM AND THE REALITY OF SOCIALISM IN CHINA

Beijing RED FLAG in Chinese No 6, 16 Mar 82 pp 21-31

[Article by Duan Ruofei [3009 5387 7236]]

[Text] In modern world history, following the development of the contradictions in capitalism, a new branch of learning--the theory of socialism--emerged as the times required. When the theory came into being, took shape and was still in its initial stage of development, the historical conditions were immature, so it had to have a utopian nature. After the 1840's, along with the gradually ripening historical conditions and the development of the movement for the working class to win liberation, through the discriminating and revolutionary creations of Marx and Engels, the theory of socialism proceeded from fantasy to science.

Scientific socialism emerged on the basis of the international socialist movement. After its emergence, it directed and promoted, in turn, the development of the socialist movement. The victory of the Russian October Revolution helped turn scientific socialism from theory into reality in a big country. After World War II, socialism developed from the practice of a specific country to the practice of countries on an international scale. At the same time, proceeding from the actual conditions in their own countries, the working class and communists of the other countries in the world were all exploring roads leading to socialism.

Under the leadership of the CCP and the guidance of the theory of scientific socialism, in 1949 the Chinese working class and laboring people won nationwide victory in the revolution and established the state regime under the people's democratic dictatorship. Through new democracy and the transitional period of advancing to socialist revolution, the establishment of socialist society began in China. This was the greatest and most profound social change in Chinese history. The eighth national CCP congress, held in 1956, affirmed this great victory, summed up our experiences and clearly charted the path for the development of China's socialist society.

From the establishment of our socialist society up to this day, more than 20 years have elapsed. During this period of time, owing to the serious faults and errors caused by "leftist" guiding ideology, and particularly the sabotage by the Lin Biao and Jiang Qing counterrevolutionary cliques during the 10 years of internal disorder, our socialist cause suffered colossal setbacks and the superiority inherent in the socialist system was not brought into proper play. Despite all this, the socialist nature of our society has not changed. On the contrary, it is precisely because our socialist system possesses outstanding stability and powerful vitality that we could victoriously smash the Lin Biao and Jiang Qing counterrevolutionary cliques and corrected our own serious faults and errors. Since the 3d Plenary Session of the 11th CCP Central Committee, in proceeding from China's national condition and applying the theory of scientific socialism, the CCP Central Committee corrected once and for all the "leftist" mistakes in its guiding ideology, made a strategic decision to readjust the economy and restructure the economic system, and formulated a series of correct policies for perfecting and developing the socialist system, thus ensuring the healthy development of our socialist society.

China's present-day society is a society established by the working class and laboring people under the leadership of the CCP and the guidance of the theory of scientific socialism by following the inevitable laws of historical development. The economic and political readjustment and reform we are carrying out now under the direction of the line formulated by the 3d Plenary Session of the 11th CCP Central Committee are aimed at perfecting and developing China's socialist society. The reality of socialism in China is the concrete embodiment of the theory of scientific socialism founded by Marx and Engels and its development under new historical conditions.

I

Socialism is a social formation more advanced than any social formations in human history and is an integral whole of the economic forms (the relations of production) which suits the more advanced stage of development of the social productive forces and the political and cultural systems which correspond to the former. A survey of the economic formation (the relations of production) as the foundation will elucidate the problems we are going to discuss.

In the theoretical system of scientific socialism, socialized productive force is a prerequisite for, and of basic significance to, socialism. A socialist society without any socialized productive force would be nothing but a castle in the air. Adherence to the thesis that only on the basis of socialization of productive force can socialist society be established is by no means philistine economic materialism but rather Marxist historical materialism. The most important ground for the argument which doubts the nature of China's present-day society is that we have not, as they see it, established a socialized productive force of the socialist society. Whether we have established, after all, the socialized productive force of a socialist society is indeed a basic prerequisite for judging whether our society is a socialist society.

The reason why the theory of scientific socialism founded by Marx and Engels is scientific is that, generally speaking, it does not proceed from the concepts of rationality and equality and from wishes, ethics and ideals, as the theory of utopian socialism does, to draw conclusions about socialism and to take socialism as an embodiment of such concepts as the realm of equality divorced from the state of the development of the material productive forces; on the contrary, it proceeds from the observation and study of the laws of the development of the material productive forces and establishes the objective grounds for the inevitable realization of socialism. Under the relationships of the capitalist commodity economy, in terms of the theory of scientific socialism, the historically developed socialized productive forces and all forms of the system of private ownership, including the system of capitalist private ownership, are diametrically mutually exclusive. The result of the development of the contradictions between the socialization of productive force and the system of private ownership is the replacement of the system of private ownership by the system of socialist public ownership which suits the socialization of productive force. It means the birth and establishment of socialism. All theories that depart from the survey of the socialization of productive force are idle dreams. It is impossible to build a genuine socialist society by leaping over the historical stages of the development of productive force. What social forces to depend on and what path to take in realizing socialism as distinct from utopian socialism, but not the fundamental indication, is whether the socialization of productive force is regarded as the point of departure for theory; practice is the most fundamental demarcation line between scientific socialism and utopian socialism.

Then, in terms of the theory of scientific socialism, what ultimately is socialized productive force? In his work "The Development of Socialism From Utopian to Scientific," Engels summarized the description by Marx in his "Das Kapital" on the historical process from individual production to socialized mass production, as follows:

"As testified by Marx, if the bourgeoisie does not turn those limited means of production from personal means of production into socialized ones, that is, turn them into means of production for the common use of large numbers of people, it will be impossible to turn them into powerful productive forces. Spinning machines, motorized weaving machines and steam hammers have replaced spinning wheels, manually operated weaving machines and manually operated forging hammers; factories which need the cooperation of hundreds or thousands of people have replaced small workshops. Like the means of production, production itself has turned from a series of individual actions into a series of social actions and, in addition, the products have been turned from personal products into social products. Now yarn, cloth and metal articles produced by factories are common products of numerous workers, which must go through their hands before they become finished products. No one of them can say: 'I produced this product. It is mine.'" ("Selected Works of Marx and Engels," Vol 3, p 426)

Thus it can be seen that so-called socialized mass production, as Marx and Engels saw it, means the socialization of the means of production, the process of production and the finished products of production, and also means that the means of production are those which are commonly used by many people, the process of production is that which is carried on by hundreds or thousands of people in the spirit of a proper division of labor and coordination, and the finished products are those which are commonly produced and owned by them.

Socialism is, in terms of its economic form, the inevitable demand of this kind of socialized productive force and the relations of production which suit the nature of the former; in other words, the socialist relations of production are established on the basis of this kind of socialized productive force. Then does present-day China actually have the socialized productive forces on which the socialist relations of production can be established as Marx and Engels mentioned?

The social productive forces during the stage of socialist transformation and at the present stage (after the basic completion of the socialist transformation of the private ownership of the means of production up to now) were, generally speaking, in a state of uneven development, in which advanced and backward social productive forces coexisted. However, in this uneven development, the socialized productive forces have reached a certain level.

The socialization of the productive forces can be analyzed from different aspects. In the following passage, we are going to make a separate and rough survey of the situation of China's socialized productive forces during these two historical stages through some figures and dates and from different aspects.

Let us first have a look at the basic situation of China's socialized productive forces during the stage of socialist transformation.

First, after the founding of the PRC, we confiscated bureaucrat-capitalist enterprises and revived production. By the end of 1952, that is, on the eve of the all-round implementation of socialist transformation, China's steel output totaled 1.35 million tons (the total world steel output in 1870 including that of Britain, the United States, France, Germany and other advanced countries was 520,000 tons); electricity was 7.3 billion kilowatt-hours; the ratio of the total industrial output value to the total value of industrial and agricultural output constituted 41.5 percent; that of modern industry to the total industrial output value accounted for 64.2 percent and the number of staff and workers was 16 million. Second, we adopted the principle of effecting socialist transformation simultaneously with socialist construction. The socialist transformation made rapid progress and, at the same time, the socialized productive forces also developed at a very fast pace. Between 1953 and 1956, the annual progressive increase in the total national industrial output value was 19.6 percent. Third, what is particularly important is that while observing and studying the problem of the relations between socialized productive force and socialist revolution, instead of isolatedly and exclusively concentrating on the quantitative targets of socialized productive force (in the theory of scientific socialism, there is no such mechanical definition relating to this target; of course, this does not mean that there is no need to have a certain quantity, and this point must not be misunderstood), we must put the question into a certain historical context and make a concrete survey of it. It must be realized that the important part of the section of socialized productive force we possessed was highly centralized. It controlled the economic lifelines of the whole country and furthermore had been in the hands of the state under the leadership of the working class and become an economy that was socialist in nature. This fact was of decisive significance. The contradiction between this newborn socialist economy on the one hand and the continued existence of a substantial capitalist economy and individual economy on the other hand constituted the principal contradiction in China's new democratic society. Dialectics tells us that contradictions push things forward. It was precisely this contradiction, and the sharpening of the spread and struggle of this contradiction, that pushed our country forward from the new democratic society to the socialist society. (Please note: In making a survey of capitalist society, Marx and Engels analyzed its contradictions between the socialized mass production and the capitalist private possession and pointed out that the spread and sharpening of this contradiction--centering on cyclical economic crises--would lead to the collapse of capitalism and the birth of socialism. The contradiction within the range of history which Marx and Engels analyzed and which would propel history to socialism and the contradiction within the range of history which we are now analyzing are different and must not be analogized simplistically or applied mechanically. To fail to ascertain that kind of contradiction manifested by the cyclical economic crises within the range of history we are observing and studying, and then to categorically assert that China does not have the historical grounds for realizing socialism, is to commit the major logical mistake of drawing an erroneous analogy.) The pace of history is certainly not deranged. China's transition from a new democratic society to a socialist society was a necessity of historical development.

Let us take a further look at the situation of China's socialized productive force at the present stage.

The number of industrial enterprises between 1957 and 1980 increased from 170,000 to 377,000. (China had 580,000 forging presses, of which 3 were 10,000-ton and above hydraulic pressure machines; there were 21 such machines abroad; of the 580,000 forging presses, 35 were 1,000-ton and above hydraulic presses, which was equal to the number of such presses owned by the European Economic Community. It had 2.52 million cutting machine tools, only exceeded by the United States and the Soviet Union, ranking third in the world.) The number of staff and workers between 1957 and 1980 increased from over 30 million to 100 million. The output of steel between 1957 and 1980 increased from 5.35 million tons to 37.12 million tons. The proportion of industrial output value in the total industrial and agricultural output value between 1957 and 1980 increased from 56 percent to 75 percent. Electricity was extensively used. Such industries as machine building, automobile manufacturing, ship building, aircraft manufacture, electronics, petrochemistry, plastics, chemical fiber and synthetic rubber had already been set up. The use of the most advanced present-day branches of science and technology, such as electronic computers, automatic control, atomic energy and lasers, had already begun to be used in some departments. Machinery, electricity and chemical fertilizers were extensively applied to agriculture.

In 1980, the power-driven equipment for agricultural use totaled over 200 million horsepower; electricity used in rural areas totaled 32 billion kilowatt-hours, and more than 12 million tons of chemical fertilizers were applied. The area of farmland plowed by tractors was over 610 million mu, accounting for 41 percent of all farmland, and the area of farmland under drainage and irrigation totaled more than 670 million mu, constituting 45 percent of all farmland. The application of modern science and technology to agriculture had already begun. An independent and comprehensive national economic system with socialized productive force as the leading factor had been gradually set up.

The above figures and data are far from complete and precise. However, from them we can see that China actually has a considerable socialized productive force. In accordance with the theory of scientific socialism of Marx and Engels, the socialist relations of production can be established on the basis of such a productive force. Our socialist relations of production are established on a material foundation of socialized productive force. Precisely because of this, our socialism is scientific socialism. Therefore, it has the outstanding stability and powerful vitality which can surmount serious setbacks and difficulties. The categorical argument that we do not have the socialized productive force on which to establish the socialist relations of production as specified by Marx and Engels is groundless. As for the argument that socialist relations of production can be established so long as we have certain political conditions regardless of the state of the productive force, this is of course a misunderstanding or misinterpretation of the socialist nature of the society we have established on the foundation of socialized productive force, and is not a Marxist scientific explanation of the socialist nature of our society.

In accord with the theory of scientific socialism, socialized productive force is the material foundation of a socialist society, but on no account does this mean that the level of development of productive force is the only factor for the emergence and victory of socialist revolutions. Marxism holds that the emergence and victory of any socialist revolution and the replacement of old social formations by new social formations are the outcome of the interaction of various social and historical factors on the basis of the movement of productive force, and not the product of the single factor of the movement of productive force. That is the case with the social change of the replacement of feudalism by capitalism and is much more so with regard to a socialist revolution in which the working class conscientiously establishes the socialist system under the guidance of the theory of scientific socialism. The essential socialized productive forces are the ultimate decisive factor for realizing socialism but not the only factor; they are the necessary conditions for establishing a socialist society but not the sufficient conditions. The emergence, development and victory of socialist revolution in a certain country are the outcome of the common actions of numerous economic, political, ideological and cultural, practical and historical, domestic and international as well as objective and subjective conditions. That is to say, a socialist revolution moves forward amid the "coordinated actions" into which various social forces are synthesized on the basis of economic strength. One must not suppose that this process of revolution is merely an economic process. In addition, the maturity of the many conditions which promote the emergence, development and victory of the revolution in a certain country by no means corresponds mechanically with the level of the social productive forces of that country. Therefore, the world socialist movement is characterized by uneven development. In the early 20th century, the Russian socialized productive forces developed on a considerably large scale, but compared with those of the European and other developed countries, its socialized productive forces were still low. Owing to historical, theoretical, political and other reasons, the Russian socialist movement came to the forefront of the world ranks. Moreover, the special environment created by World War I constituted favorable conditions for the Russian proletariat to seize political power. In light of the historical conditions of the Russian proletariat, Lenin pointed out that the process of historical development could be altered. He adopted the principle of first seizing political power and then wielding this political power to develop the social productive forces and led Russia in taking the socialist road. In answering the accusations of Sukhanov and others that "the Russian productive forces have not developed to the degree necessary to realize socialism," Lenin pointed out: "You say that civilization is necessary for the building of socialism. Very good. But why could we not first create such prerequisites of civilization in our country, ...and then start moving toward socialism? Where, in what books, have you read that such variations of the customary historical sequence of events are impermissible or impossible?" "While the development of world history as a whole follows general laws it is by no means precluded, but on the contrary presumed, that certain points of development may display peculiarities in either the form or the sequence of this development." ("Selected Works of Lenin," Vol 4, pp 692, 690) This theoretical exposition on the rationality of the October Revolution (being in conformity with the laws of historical development) is of universal significance. On the basis of this exposition, Lenin predicted: "Subsequent revolutions in oriental countries, which possess much bigger populations and much more diverse social conditions, will undoubtedly display even greater distinctions than the Russian revolution." (ibid., p 692) The course of the development of the Chinese revolution has fully confirmed this prophesy of Lenin's.

In modern times, since China was a semicolonial, semifeudal big oriental country, its social productive forces were, generally speaking, quite backward and also exceedingly uneven. There was an advanced sector in the backward social productive forces, that is, the modern industry, which constituted about 10 percent of the national economy. Although this sector of socialized productive force was not a large proportion, it was quite concentrated, and thus it controlled the state's economic lifelines. It is precisely this economic fact that fundamentally determined the course of development, the future and characteristics of the Chinese revolution. In analyzing this question, Comrade Mao Zedong pointed out: "China already has a modern industry comprising about 10 percent of its economy; this is progressive and different from ancient times. As a result, China has new classes and new political parties--the proletariat and the bourgeoisie, proletarian and bourgeois parties. The proletariat and its party, because they have been oppressed by a multitude of enemies, have become steeled and are qualified to lead the Chinese people's revolution." ("Selected Works of Mao Zedong," Vol 4, p 1320)

In leading the Chinese revolution, the Chinese communists inherited and developed Lenin's thinking--first, when the conditions for seizing political power were ripe, we first seized political power, then revived and developed the econony; second, on the basis of a certain scale of socialized productive force, we formulated and carried out the principle of simultaneously carrying out socialist revolution and socialist construction and creatively opened the path for socialist transformation which was suited to China's national condition. Under the correct and strong leadership of the CCP, China entered the socialist stage at a relatively rapid pace. Despite some shortcomings in that the changes were too rapid and the work was far from meticulous in the later stage of the socialist transformation, viewing the situation as a whole, great successes were really scored. The brilliant successes in the rapid development of the social productive forces and the marked improvements in the people's living standards during the stage of the first 5-year plan forcefully prove this point. That China entered socialist society earlier than some countries whose socialized productive forces were more developed was the result of the interaction of numerous conditions on the basis of the required socialized productive forces, the result of the efforts of the CCP to lead the Chinese working class and the masses of the people in active struggles by following the laws of historical development, the embodiment of the Marxist creative power of the Chinese working class and the Chinese people, and the pride and glory of the Chinese nation.

II

When we say that China really has the socialized productive forces on which socialist relations of production can be established, we do not mean that all the productive forces of our country have reached the level of socialization. Viewed from the situation as a whole and compared with the world's developed countries at present, the level of our productive forces is relatively low; the level of development of the productive forces is also quite uneven, in terms of the national scale. Simple manual tools, modern large machines and automated mechanical systems exist side by side.

It is because of this state of affairs that our country cannot adopt a unitary system of socialist ownership at the present stage. In any case, our socialized productive forces occupy a dominant position in the whole production of the country, and socialized mass production dominates all of the country's economic lifelines. Therefore, our system of socialist ownership also occupies a dominant position. In addition, "this is a kind of general light illuminating all things and it will act on all other colors within it and change their hue." ("Selected Works of Marx and Engels," Vol 2, p 109) Illuminated by the brilliance of the system of socialist ownership, the economy under the system of individual ownership by the working people, within certain prescribed limits, has changed its own color and become a necessary complement to the socialist economy.

In regard to the nature of China's present-day society, no matter what comments some people at home and abroad might make and what judgments they might pass, in the whole social and economic relations of our country, the system of socialist ownership occupies a dominant position, and this is a hard fact which speaks louder than any words. Please look at:

Industry (1980)--The total industrial output value under the state ownership system constituted 78.7 percent and that under the system of collective ownership, 20.7 percent; the two added together comprised 99.4 percent. That was largely the case with fixed assets and the number of staff and workers.

Agriculture (1980)--The area of cultivated farmland under the state ownership system accounted for 5.7 percent and that under the system of collective ownership, 94.2 percent (which included the 7.1 percent of private plots of the commune members); the two added together comprised 99.9 percent. The grain output under the state ownership system made up 3 percent and that under the system of collective ownership, 91.2 percent; the two added together comprised 94.2 percent. The total agricultural output value under the state ownership system accounted for 3.8 percent and that under the system of collective ownership, 77.2 percent; the two added together comprised 81 percent.

Commerce (1980)--The total retail sales of commodities under the state ownership system occupied 84.2 percent and that under the system of collective ownership, 11.9 percent; the two added together comprised 96.1 percent.

Finance--As the national centers for settling accounts, credit centers and centers for receipts and payments, the banks were already in the hands of the state and the system of socialist ownership dominated all positions.

Then, is this society, in which the system of socialist ownership occupies a leading and predominant position, not socialist in nature? Can we doubt the socialist nature of our society just because the system of socialist ownership has not, in the whole economic relations, reached the extent of "being perfect and pure"? Or must a society be regarded as a socialist society only after the whole society has entered the "perfect and pure" socialist relations of production?

Here we can make a historical survey and comparison.

In the slave society, the system of ownership by the slave owners constituted the basic economic relationships of the society and thus determined the nature of the society. However, in addition to this, there were still large numbers of people free from the system of ownership by the slave owners. The society was actually not "perfect and pure." Ancient Greece serves as an example.

In the feudal society, the system of feudal ownership constituted the basic economic relationships of the society and thus determined the nature of the society. However, in addition to this, there were still remnants of the old society of ownership by the slave owners, the seeds of future capitalism, and also a large number of individual economies of the land-holding peasants and small handicraftmen. The society was actually not "perfect and pure." The European medieval feudal societies and the Chinese feudal society were the same in this respect.

In the capitalist society, the system of capitalist ownership constitutes the basic economic relationships of the society and thus determines the nature of the society. However, in addition to this, there are still a great number of multifarious forms of individual economy and other economic forms. Neither is it actually "perfect and pure." The most developed countries in modern history and at the present time, such as the United States, Britain and France are all societies like this. Just as Lenin said: "There is not a country in the world, even the most developed, where capitalism is to be found exclusively in its most pure form." ("Collected Works of Lenin," Vol 29, p 163)

The form of ownership system of a society which constitutes a basic economic relationship and occupies a predominant position in that society determines the nature of that society. In accordance with this principle, ancient Greece can thus be called a slave society; the various European medieval countries can be called feudal societies; and countries in modern history and at the present time such as the United States, Britain and France can be called capitalist societies. Why then, can present-day China, where socialist production relationships occupy a leading and predominant position, not be called a socialist society?

In fact, in his "Critique of the Gotha Program," Marx discussed this problem: "What we have to deal with here is a communist society (note: this refers to its first stage, that is, the socialist society as we now call it) which has not developed on its own foundations, but, on the contrary, has just emerged from capitalist society. It is thus in every respect, economically, morally and intellectually, stamped with the birthmarks of the old society from whose womb it emerged." ("Selected Works of Marx and Engels," Vol 3, p 10) Marx here depicted the general characteristics of a socialist society. The reality of China's present-day socialism has confirmed this depiction by Marx. A socialist society, and especially in the early stages of development after its emergence, economically and in other respects "is still stamped with the birthmarks of the old society from whose womb it emerged." Thus it is not perfect and pure. It is a phenomenon which is in conformity with the course of historical development rather than something strange. Everything has its historical course of coming into being and developing. A socialist society will inevitably undergo its own course of development, a course from "imperfect and impure" to relatively "perfect and pure." Today's Chinese socialist society is still in its infancy, but it has already the regularity of a socialist society. We must not negate its fundamental nature because of its "imperfection and impurity."

It must be acknowledged here that the course of development of the socialist society, which is from "imperfect and impure" to relatively "perfect and pure," is a course of development which "is based on its own foundations" rather than being a "transition period." The characteristics of the transition period of socialism are just as Lenin pointed out: "This transition period must combine the features and properties of both these forms of social economy. This transition period has to be a period of struggle between dying capitalism and nascent communism--or, in other words, between capitalism which has been defeated but not destroyed and communism which has been born but is still very weak." ("Selected Works of Lenin," Vol 4, p 84) When China began its transition from the new democratic society to the socialist society (1952), the proportions of the state-run economy, the capitalist economy and the individual economy in the national economy were 19.2 percent, 6.9 percent and 71.8 percent respectively. But the present situation is that the socialist economy occupies a leading and predominant position. This state of affairs and the situation in which socialism and capitalism were in a state of decisive struggle of "who is beating whom" cannot be mentioned in the same breath. The difference in quantity has changed into a difference in quality. In the mid-1950's, our country victoriously pulled through the "transition period," abolished the exploiting system and the system of private ownership, established the basic socialist economic, political and cultural institutions and thus entered the socialist society. It is possible that the lumping together of these two historical stages of different natures will lead to "leftist" mistakes of inappropriately applying the economic and political categories in the transition period to the socialist society. These include the struggle between the two classes and the two roads being the principal contradiction in the society, and continuing to indulge in taking class struggle as the key link. This is not merely a logical analogy but has been proved profoundly by historical lessons.

It must be noted that the theory that it is still necessary to carry on "uninterrupted revolution" after our country has entered the socialist society (namely, the so-called theory of "continuing revolution under the dictatorship of the proletariat" or of "continuing revolution under socialism") is in fact a theory which negates the socialist nature of our present-day society. Engels said: "The so-called 'socialist society' must, like any other social system, be regarded as a society which undergoes constant changes and reforms rather than a fixed and unchangeable thing." ("Collected Works of Marx and Engels," Vol 37, p 443) The changes and reforms of socialist society mentioned here by Engels referred to those which took place on the socialist society's own foundations. These social changes and reforms are fundamentally different from the political revolution and economic revolution of one social system replacing another social system. These must not be jumbled together. The course of the growth and development of socialist society belongs to the course of a qualitative change on the foundations of its own quantitative regularities rather than a historical transitional period which undergoes a qualitative change. Therefore, we cannot and must not carry on "uninterrupted revolution," because according to the definition made by Marx and Engels, "uninterrupted revolution" falls into the category of political revolution and economic revolution. (Of course, this does not mean that we have fulfilled the tasks of our socialist revolution, and by no means does this mean that we need no longer do our work in the revolutionary spirit. This must not be misunderstood.) At the first stage of communist society, the socialist society is a society with a relatively stable social nature. China has entered the historical stage of a stable development of socialist society. The argument that China's present-day society is still in the course of "interrupted revolution" is, in essence, negating the fact that our country has entered the historical stage of socialism and is negating the socialist nature of our society.

In short, our history has really entered the socialist society. This is the foundation for our future progress and development. All theories which negate the fact that our history has entered the socialist society in whatever form do not tally with China's realities.

True, while achieving brilliant successes after the establishment of our socialist society, we also suffered tremendous setbacks and grievous losses. In surveying the reasons for the emergence of these problems, apart from the obvious factor of the sabotage caused by the Lin Biao and Jiang Qing counterrevolutionary cliques, they include: 1) "leftist" mistakes committed in our guiding ideology; 2) drawbacks in the system which were shaped in history; and 3) failure of some of our concrete forms of the socialist ownership system and the distribution and management forms to correspond with the basic system of socialism. Our mistakes are definitely not the result of the establishment of the socialist system. On the contrary, it is precisely because of the establishment of the socialist system that we were still in a position to promote a considerable development of the productive forces when we suffered all kinds of obstructions and sabotage. The problem we are now facing is to restructure actively and steadily the system; to establish and perfect the operation and management forms which suit different systems of ownership, different regions and different departments; to promote the productive forces to develop at a proper speed; and to constantly improve and develop our socialist system while upholding the basic system of socialism. We must do this after bringing order out of chaos in the guiding ideology and continually bring order out of chaos in practical work. This must be done on the basis of a thorough and well-conceived investigation and study and when conditions are ripe, rather than changing the already established socialist system and turning around to go in for new democracy or state capitalism, as some comrades have advocated.

III

The reality of China's present-day society is significantly different from the depiction on socialist society by Marx in his "Critique of the Gotha Program," and the assertion made by Marx and Engels that a socialist society is a society in which all the means of production are owned by the whole society and which has no commodities or money. In the eyes of some comrades, it is imperative to take this idea of Marx' and Engels' as the criterion in deciding whether China's present-day society is a socialist society or not. This kind of viewpoint and method are, in our opinion, incorrect.

In the theoretical system of scientific socialism founded by Marx and Engels, the depiction on the future socialist society is an important component part. Engels said: "Since socialism has become a science, people are required to regard it as a science, that is, people are required to study it." ("Selected Works of Marx and Engels," Vol 2, p 301) In regard to this depiction of a socialist society by the founders of scientific socialism, we must integrate the historical grounds on which they made this kind of depiction in their times with the socialist practice in the 20th century and study it in a scientific way.

In the literature of scientific socialism, Marx' "Critique of the Gotha Program" occupies an important position. In the history of the theory of scientific socialism, this work for the first time divided communism into the stages of different degrees of economic development and depicted the fundamental characteristics of the two stages. Even now, it is still an important document for us in studying the theory of socialism.

However, can we consider that, since the depiction of socialist society in "Critique of the Gotha Program" provided us with a scientific definition of socialist society, we must take it as the only and absolute criterion or pattern and use it to rule our present-day socialist society?

First of all, we must clarify whether Marx' depiction on socialist society is a scientific conjecture and assumption or a scientific definition of socialist society.

Marx' criticisms of the Gotha program, namely, the "marginal notes to the program of the German Workers Party" were originally marginal notes for criticism, written by Marx in the draft program of the German Social Democratic Party into which the two parties in the German workers' movement (the Eisenaches and the Lassalleans) were going to merge. In criticizing the Lassallean articles of creed in the Gotha draft program, such as "undiminished" proceeds of labor, "equal rights" and "fair distribution," Marx discussed in passing some economic properties of socialist society. He made the following expositions:

1. Socialism is "a society based on common ownership of the means of production";

2. Socialist society is a society "just as it emerges from capitalist society, which is thus in every respect, economically, morally and intellectually, still stamped with the birthmarks of the old society from whose womb it emerged";

3. For this reason, in the distribution of personal consumer goods in a socialist society, distribution according to work should be practiced after various deductions are made from the total social products;

4. The labor of the individuals directly constitutes a component part of the total social labor. Therefore, the forms of "value" vanish and commodities and money are withdrawn from social economic life.

So long as we make a careful survey, we will realize that the "Critique of the Gotha Program" was not a special work of Marx' which aimed at studying the socialist society and solving the problem of its scientific definition. While criticizing the Lassallean articles of creed, Marx here only discussed in passing matters relating to socialism and did not expound the various characteristics of socialist society in an all-round way. For instance, in it there were no expositions on such principles as socialized mass production being the fundamental prerequisite and material foundation for the socialist society, or the extremely important economic property that production should be regulated in accordance with the needs of society and individuals in a planned way. No further detailed deliberations were made to the already involved matters relating to socialism.

What is particularly important is that the nature of these expositions by Marx is a kind of scientific conjecture of future things rather than a scientific summarization of the nature of the objects which people have fully understood. On this matter, Lenin gave a reasonable explanation. He pointed out:

"All Marx' theories are the application of the theory of development--in its most consistent, complete, considered and pithy form--to modern capitalism. Naturally, Marx was faced with the problem of applying these theories both to the forthcoming collapse of capitalism and to the future development of future communism.

"On the basis of what facts, then can the question of the future development of future communism be dealt with?

"On the basis of the fact that it has its origin in capitalism, that is, develops historically from capitalism, that it is the result of the action of a social force to which capitalism gave birth. There is no trace of an attempt on Marx' part to invent a utopia or to indulge in idle guesswork about what cannot be known. Marx treated the question of communism in the same way as a naturalist would treat the question of the development of, say, a new biological variety. Once he knew that it has originated in such and such a way and was changing in such and such a definite direction, he would be able to expound the question of the development of the biological variety." (See "Collected Works of Lenin," Vol 3, p 243. The passages quoted here are retranslated.)

Thus it can be seen that Marx' expositions on future socialism is only a scientific conjecture rather than a scientific definition or final conclusion on the socialist society.

Marx did not define the socialist society and, in addition, it was impossible for him to do so at that time. This is because, in order to make a scientific definition of an object, it is necessary to make such a definition after, and not before, one has had a relatively full understanding of its rich contents and nature. Furthermore, only after the object has taken shape and developed fully, can a full understanding of it be obtained. Just as Marx profoundly pointed out: "In pondering the forms of life of mankind and proceeding to make scientific analyses of it, a road contrary to the real development is invariably taken. This pondering is started after the event, in other words, is started with the results of the completion of the course of development." ("Collected Works of Marx and Engels," Vol 23, p 92) In the 19th century in which Marx and Engels lived, socialism, as a brand-new social formation and social system, had not emerged on earth. How could they possibly gain a full understanding of the socialist society and give it a scientific definition?

We do not regard Marx' expositions on socialist society as a scientific definition. This does not at the least mean negating their scientific value. Conversely, we hold the view that Marx' expositions are of quite important and scientific theoretical significance, some of which contain great truth. This is because, although his depiction was a conjecture and assumption, it was formulated by Marx after making a strict scientific study of the developmental trends of the contradictions between the socialized productive forces which took shape in the capitalist society and the system of private ownership under capitalism. He applied the materialist dialectical viewpoint of development, and thus it was a scientific assumption and hypothesis. It plays an important instructive role in the practical movement of socialism and will be verified, revised, enriched and developed in this practical movement. Engels said: "So long as natural science is pondering, the form of its development is hypothesis.... At first it is only based on limited facts and observation. Further observed material will help these hypotheses become more pure. Some are discarded and some revised until the pure form of a law is eventually reached." ("Selected Works of Marx and Engels," Vol 3, p 561) Engels here brought to light the laws of scientific development. The theory of the future socialist society develops in the form of an hypothesis. This is a phenomenon entirely in conformity with the laws of scientific development.

Judged from the standpoint of Marxist materialism, any theory of social science is nothing but a generalized reflection and abstract manifestation of a certain stage of historical movement. This is also the case with scientific socialism itself, which was founded by Marx and Engels. Engels said: "Our theory is a theory of development rather than a dogma which should be recited fluently and repeated mechanically." ("Collected Works of Marx and Engels," Vol 36, p 584) The method of taking some conjectures and assumptions about socialist society, which were formulated by Marx and Engels and were based on the situation of the historical movement of the European capitalist countries and the United States in the 19th century, and their cognitive results belonging to certain historical conditions, as unalterable absolute truth and as an a priori pattern and sole criterion and using them to rule present socialist reality runs fundamentally counter to the viewpoint of Marxist materialist theory. Theory is the expression of historical movement. The socialist movement is advancing and the theory must also develop along with it. Pushing the theory of scientific socialism founded by Marx and Engels forward on the basis of the present great socialist practice is the Marxist correct attitude in handling theory.

By the 20th century, a tremendous leap has occurred in the socialist movement under the guidance of scientific socialism--scientific socialism has developed from theory to reality and the socialist system has been established in large groups of countries. On the one hand, the reality of socialism has confirmed the scientific hypothesis by Marx and Engels about socialist society, and on the other hand, some of the expositions in their assumptions (like their argument that there are no commodities or money in the socialist society) have been revised. The present magnificent reality of socialism of the working class and the masses of the people has created and continues to create forms of realizing and developing socialism, which suit the national condition of various countries. Because of the different national conditions and different courses of historical development, in present socialist practice, it is inevitable that there have emerged multifarious forms different from the original assumptions by Marx and Engels. This is important development of the assumptions by Marx and Engels about socialist society and great progress in historical development.

Under the direction of the line of the 3d Plenary Session of the 11th CCP Central Committee, China's socialist practice has fundamentally corrected the "leftist" mistakes existing in our guiding ideology for a period of time in the past and ensured the new stage of development. Having summed up the experiences and lessons in socialist practice since the founding of the PRC and studied the experiences and lessons in international socialist practice, the CCP Central Committee pointed out: "There is no rigid pattern for the development of the socialist production relationships. At every stage our task is to create those specific forms of the production relationships that correspond to the needs of the growing productive forces and facilitate their continued advance." ("Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC") At the present stage (this historical stage is very long), the state-run economy and the collective economy constitute the basic socialist economic forms of our country and the working people's individual economy within certain prescribed limits is a necessary complement to the economy under the system of socialist public ownership. Socialist economic units should become relatively independent major economic bodies in the unified socialist economic system. It is necessary to fully develop socialist commodity production and commodity exchange. It is essential to practice a planned economy on the basis of the system of socialist ownership and at the same time bring into play the supplementary role of regulation by market mechanism. In drawing up plans, it is necessary for the state to give full consideration to and use the law of value. The point of departure and fundamental aim of socialist economic activities are to meet the increasingly growing material and cultural needs of the people.

The system of socialist ownership, that is, the socialist production relationships is realized through a series of economic activities, such as production, exchange and distribution. Exploring the operation and management forms and distribution forms which are aimed at realizing the socialist principles is an important task in improving and developing the socialist system. Since the 3d Plenary Session of the 11th CCP Central Committee, we have exerted herculean efforts in this respect. In the vast rural areas, the implementation of various forms of production responsibility system has helped closely integrate the responsibility, power and interests of the various major economic bodies and the laborers and tremendously aroused the enthusiasm and the creative power of the peasants. Coordinated with other conditions, the production responsibility system has at one stroke swept away the many difficult problems which have existed since the agricultural cooperativization. (Of course, many new problems have inevitably arisen which need to be constantly solved by the CCP, the people's government and the masses of people together.) As a result, the situation suddenly cleared up. Where does the secret lie? Obviously, this state of affairs is not the result of the enthusiasm of individual production, much less the result of capitalism, but instead the result of effectively giving full play to the enthusiasm of socialism. On the basis of public ownership of the principal means of production like land, the practice of unified leadership and decentralized operations have been introduced. This practice is essentially different from the individual economy before the agricultural cooperativization or the practice of dividing the fields and working alone. This is a necessary readjustment of some aspects of the socialist production relationships and a restructuring of the management and distribution systems, rather than the replacement of the socialist collective economy by the individual economy. The production responsibility system of linking remuneration to output which is clear in regard to responsibility, simple and convenient to calculate, and easy to supervise is a good form of socialist operation and management, which is suited to the rural reality at the present stage. It is also a good form of implementing the socialist principle of distribution according to work. Exploratory reforms have begun to be carried out in industry, communications, finance and commerce under the prerequisite that they should be subject to and serve the readjustment. Marked achievements have been made in the experimental work of expanding the decisionmaking power of enterprises and implementing the forms of the economic responsibility system. All this has initially and forcefully shown that this form of management is a good form of socialist management. In socialist relations, the individual interests and those of the collective are integrated. This is the essential basic feature which distinguishes socialism from any society based on the system of private ownership and whose interests are antagonistic. "Socialism integrates individual interests with those of the collective instead of denying the former." ("Selected Works of Stalin," Vol 2, p 355) The whole problem lies in into what forms we can properly integrate the two. (The interests of the collective we refer to here include the interests of the state. The interests of the state are first and foremost.) Only in socialist practice can this problem be solved. Since the 3d Plenary Session of the 11th CCP Central Committee, the exploration and efforts we have made in improving the socialist forms of management and of distribution have been aimed, essentially, at seeking specific forms suited to the characteristics of the different regions, trades and departments. They are aimed at properly integrating individual interests with the interests of the collective and the state and fully arousing the enthusiasm of all laborers for socialism. Practice has proved that our efforts have produced remarkable successes. Over the past 3 years, production has steadily developed; the economic results have gradually improved; an all-round increase in agricultural output has been achieved; market prosperity has been promoted; and some improvements in the people's livelihood have been obtained. Thus bright prospects are emerging. Our socialist system is gradually improving and developing. The argument for the whole society owning all means of production and which excludes production and exchange of commodities is completely wrong. The overcentralized form of management which justifiably existed in a certain historical stage, but which now is not suited to the new situation as a fixed pattern of and absolute criterion for the socialist society (a commonly used or popular expression is the so-called "the larger the scale and the higher the level of public ownership of the means of production and the more unified the operation and management, the better") and uses it to rule the socialist form created by the industrial and agricultural laborers in their hundreds and millions in the new socialist practice and denounces the socialist form as "retrogression" and even as "capitalist restoration" is also completely wrong. The restructuring of the economic system, which we have initially begun to carry out and will continue to substantially and steadily carry out, will be another extensive and profound change in China's social and economic relations. This follows the basic completion of the socialist transformation of private ownership of the means of production. As a result of this, our socialist economic system has become more perfect and our socialist society has become increasingly mature. Our highly developed material and spiritual civilizations will certainly emerge. China's socialist society will inevitably stand erect before the world with a much more majestic and magnificent image.

IT IS IMPERATIVE TO UPHOLD THE BASIC PRINCIPLES OF MARX' THEORY OF REPRODUCTION--PART TWO

Beijing RED FLAG in Chinese No 6, 16 Mar 82 pp 32-36

[Article by Deng Liqun [6772 0550 5028]]

[Text] II. Harmonious Correlation Between the Two Major Categories Is the Basic Prerequisite for Normal Reproduction of Society

Based on the premise of his theory of reproduction, Marx first and emphatically analyzed the conditions for realizing simple reproduction, namely, variable capital plus surplus value of the first sector equals constant capital which consists of the second group. The formula which expresses this relationship is $I(v + m) = IIc$. The formula $I(v + m) = IIc$ is the objective law of the process of simple reproduction, which also holds true for reproduction in a socialist society. While studying the problem of reproduction in our society, we must divide the total output of society into the two major categories of means of production and means of consumption and by value divide it into three component parts, that is, c, v and m. In a socialist economy, there is no more surplus value, but surplus labor and surplus product remain. C represents the replacement of the machinery, equipment, raw materials and other means of production worn out or used up in the course of production; $v + m$ represents the new value created by workers in the course of production. V is used to maintain workers' living standards, ensuring simple reproduction of labor. Under the conditions of expanded reproduction, a part of m has to be retained for accumulation while under the conditions of simple reproduction, m is entirely used for consumption. In the latter case, $I(v + m) = IIc$ is the basic condition for the products under the first category and the products under the second category to be fully and mutually exchanged. If $I(v + m)$ is smaller than IIc, then a part of the means of production which has been used up and worn out cannot be replaced; if $I(v + m)$ is bigger than IIc, then part of the products under the first category will not be saleable.

Of course, in a capitalist country and especially in a socialist country, production, instead of being repeated on the existing basis year in and year out, is in general marked by expanded reproduction. The condition for realizing expanded reproduction is that the first category which comprises variable capital and surplus value is bigger than the second category which represents constant capital; the formula which expresses this relationship is I(v + m) is greater than IIc. Only in this way is accumulation possible. This is what Marx meant when he said: "In the case of production being based on capital growth, I(v + m) must equal IIc plus the part of surplus product which has formed capital and plus the additional constant capital which is necessary for expanded reproduction of the second category, the minimum expanded reproduction of the second category is the minimum actual accumulation within the first category, or the minimum indispensable for actual expanded reproduction." ("Collected Works of Marx and Engels," Vol 24, p 285) But we should not treat the matter from a metaphysical viewpoint, regarding that v + m can be increased indefinitely relative to c, and even to such an extent that the two major categories will be out of balance and out of proportion. As a matter of fact, apart from the inherent limitations, the accumulation within the first category is also limited by the possibilities of accumulation within the second category, for "consumption for productive purposes is after all related to consumption of individuals" and the production of the means of production cannot develop in isolation without being coupled with the development of the production of the means of consumption. In order to realize expanded reproduction, it is necessary to form additional means of production, but at the same time to form additional means of consumption as well. That is why Marx said: "Just the first category must use its surplus product to provide the second category with additional constant capital, the second category must also provide the first category with additional variable capital by the same token." (ibid., p 584) While talking about the necessity of increasing the variable capital under the second category in accordance with the additional constant capital originating from the part of surplus value under the first category, Marx also said: This kind of increase "has as its premise, the tendency of further capitalization of the reproduction of the means of production, in other words, the inclusion in the reproduction in the second category of an increase in the part of the surplus product which constitutes the necessities of life." (ibid., p 586) In a word, in the course of expanded reproduction, there is a mutual relationship between the two major categories in respect of demand for additional products and the satisfaction of this demand, since these sectors are markets for each other and are conditioned and limited by one another. That tells us that, in the course of economic construction, the production of the means of consumption must grow in accordance with the growth of the production of the means of production, or we should not expand the production of the means of production alone without expanding the production of the means of consumption. Failing to grasp this point is the very course of our past ills. At one time, we pursued the policy of developing heavy industry unilaterally, emphasizing the iron and steel industry alone and giving it top priority. As a result, the two sectors were seriously out of proportion and the economic results of production and construction declined substantially.

Since the 3d Plenary Session of the 11th CCP Central Committee, at which the party Central Committee laid down the eight-character policy centered on readjustment, we have been implementing this policy. Especially after the Central Committee's working conference held at the end of 1980, this policy has been implemented with much greater consciousness. Owing to efforts made in the past few years, the important proportionate relations of the national economy have really improved and some of them have remarkably improved. In the first place, the peasants have displayed much more enthusiasm. The rural economic situation as a whole is beyond expectation, and even in disaster areas the situation is much better than expected. The development of agriculture has resulted in a great change for the better in the disproportion between agriculture and industry. The Central Committee is identifying the problems which still exist in the countryside and will solve them so as to further boost agriculture.

Within the industrial sector, the relationship between heavy industry and light industry has also been becoming increasingly harmonious. Heavy industry uses some of its own products. For instance, coal is used for generating electricity and machinery is used for manufacturing machines. But even this part of the means of production is in the end subject to the limitations imposed by the production of the means of consumption, because after all the production of the means of consumption needs more means of production and in order to satisfy this need, the production of the means of production has developed and will develop for the same reason. To cite Lenin, this means: "The manufacturing of the means of production is not for the means of production itself, but for satisfying the growing demand for the means of production on the part of the industrial sector which manufactures the means of consumption." ("Collected Works of Lenin," Vol 4, p 143) Therefore, the heavy industry department must realize that although a part of its products is for satisfying its own needs, its products are after all to serve light industry and agriculture, providing them with raw materials, other input materials and increasingly advanced machinery and equipment. In this way, the orientation of development of heavy industry will be correct. But in the past, we did not do so. Did the comrades engaging in heavy industry not want to serve light industry? We cannot say this. They did not want to do so, but thought in this way: When I have developed and become stronger, I will give you a lot of help. We cannot say that there is not a word of truth in this. But this way of thinking does not cover all facets. Viewing the matter in all its facets, we should say that heavy industry, once developed, will have to better serve light industry, but in the course of its development, heavy industry must regularly serve light industry as well. We must fully realize that instead of being able to develop alone, the production of the means of production can develop only if there exists a concerted development of both the major categories; proportionate development means that in every production cycle, the development must be proportionate, instead of meaning that we may unilaterally develop one sector in a certain cycle and then another sector in a subsequent cycle so as to achieve an overall proportionate development of the two cycles. To do this practically means to give up proportionate development. If, once steel and big machines are available, we only think of setting up new steel works and machine-building factories, and often forget the objects of service while taking care of self-interest alone, we will fail to bring about the conditions for further development. We should not go along this road again. Light industry did not get timely help from heavy industry to improve its machinery and equipment, nor sufficient supplies of raw materials. On the other hand, light industry got very little investment from the state and even had to manufacture equipment to meet its own needs. This is in fact to shift to the first category a part of the materials and labor which originally belonged to the second category, inappropriately reducing the proportion of the second category. Or it had to make do with old equipment. As a result, light industry developed far more slowly than heavy industry, provided the society with consumer products which were far below its purchasing power and caused light industrial products to remain unchanged for decades. In the last couple of years, we have given priority to developing the production of consumer goods while readjusting the economy and achieved great success. As early as 1979, light industry developed faster than heavy industry and maintained a fairly high growth rate in both 1980 and 1981.

We should say that we have all the conditions for consciously ensuring the harmonious development of the production of society and even of the national economy as a whole. Under the capitalist system, since enterprises are owned by a large number of capitalists, all the connections in the field of production "can only be imposed on the entrepreneurs, as a blind law, instead of being grasped and manipulated by them collectively and rationally with a view to putting the production process under their joint control." ("Collected Works of Marx and Engels," Vol 25, p 286) With the establishment of the socialist system of public ownership, people are in a position to consciously arrange their own economic life and, as long as we know the objective economic laws in depth and undertake economic activities according to these laws, we will be able to ensure that the production of our society progresses harmoniously. This is one of the major advantages resulting from the superiority of the socialist system. In the past, the reproduction of our society became disproportionate more than once, just because we breached the objective law which prescribes that the two major categories must develop harmoniously. Of course, we might find many reasons to account for this situation. For instance, it is not so easy to know objective laws; or, under the present system of ownership and level of productive forces, it is still impossible to subject all enterprises and all products to planning, and so forth. But what deserves our special attention is that we did not handle the relationship between proportion and speed well. In the past, we held the view that proportion was not so important and that what really counted was speed. Looking back, this view just inverts the relationship between proportion and speed. Take running for instance: Only with two normal legs can one run and run fast; how can one run with one leg shorter than the other? A man will fall if he chooses to run like that. In 1958, we set high targets for the iron and steel industry, as key sector, to achieve, mobilizing thousands of people to go up mountains for steel and iron-smelting and thus caused serious disproportion in the national economy. In that year, the growth rate seemed to be very high, the total industrial and agricultural output value rising sharply by 32.2 percent from 7.9 percent the previous year. This growth rate could of course not last for long. In 1961, the growth rate of the total industrial and agricultural output value dropped sharply by 30.9 percent with respect to 1960. This growth rate again dropped by 10.1 percent with respect to 1961. Only from 1963 did the growth rate start rising again. It is therefore evident that without proportionate development it is impossible to achieve high growth rates. Comrade Chen Yun has said that the question of high or low growth rates is in fact an issue concerning the proportions of the national economy; only proportionate development will make higher growth rates feasible.

Why should we readjust the national economy? The very purpose of the readjustment is to bring about a national economy of better proportions and then to develop it more proportionately. As everybody can see, the present economic situation of our country is good. Nothing apart from the readjustment can account for this good situation. Without the readjustment, agriculture and light industry would not have developed so fast, market supplies would not have become so abundant and latent trouble would not have been eliminated. While emphasizing that heavy industry must develop at a certain speed, some comrades say that only if the growth rate of the economy has reached a certain level, will favorable conditions for readjusting the economic structure and proportions emerge. Here again, they put the cart before the horse. The heavy industry output value for 1981 is expected to decline by about 5 percent with respect to 1980. What are the reasons for this decline? In his report on the government work to the fourth session of the fifth people's congress, Comrade Zhao Ziyang made an analysis, enumerating the following cases: A number of heavy industrial enterprises have stopped producing some products in fixed supply, which are heavily stockpiled and consume a lot of energy; the energy thus saved can be used to meet the needs of light industry, therefore this measure is necessary and rational. In quite a large number of enterprises which mainly served capital construction for a long time, production is declining owing to a reduction in orders for equipment and other means of production from the sector of capital construction, the amount of investment in which has been largely reduced this year; this is inevitable in the course of readjusting the orientation of service and the structure of products within the heavy industrial sector. There is a third case. Some comrades, who, failing to sufficiently realize the necessity of readjusting the orientation of service and the structure of products of heavy industry, have not acted promptly and delayed in making necessary shifts in production; this has resulted in a decline in the production of some heavy industrial products, which should not have declined. This incorrect tendency should change. Comrade Zhao has explained very clearly why, during the readjustment period, industry output value is likely to decline temporarily. In fact, since the second half of 1981, a lot of work has been done in heavy industry with a view to changing its orientation of service, curtailing products in excessive supply and increasing products that the people need urgently for their livelihood as well as products for export. This work has already produced initial results. On the other hand, the production of heavy industry started rising again in the fourth quarter of 1981. If we had acted as some comrades advocate, striving to achieve higher growth rates for heavy industry alone while refusing to carry out further readjustment, what would have been the results? More products in ample supply would have been stockpiled and products for which nobody places orders would have been manufactured as before. This would not only have wasted labor and materials, but would in the end have again made the two sectors which were being geared to harmonious correlation, disproportionate.

In order to ensure that the production of society can develop harmoniously, we should also pay special attention to the handling of the relationships between the planned economy and regulation by market mechanism. The establishment of public ownership enables the people to handle their own economic relations and consciously carry out economic activities according to a unified plan for the society. But given the present level of productive forces and the present state of ownership in our country, instead of unifying all the economic activities, the state plan can only cover the major sectors of production and circulation.

At the working conference of the Central Committee held in April 1979, it was suggested that in our national economy as a whole, we may act according to the principle of combining planned regulation and regulation by market mechanism, mainly relying on planned regulation while giving due consideration to the functions of regulation by market mechanism. In fact, the matter had been deliberated for quite a long time before the working conference. The comrades taking part in the deliberations and discussions all approved this proposal as a principle. On 12 March of the same year, at the first seminar on business administration held by the State Economic Commission, I delivered a speech. Pointing to the past deficiencies which consist of overconcentration of power, overcomprehensive planning and lack of flexibility, and in the light of the principle deliberated upon before the Central Committee's working conference, I mentioned two possible ways of regulating the national economy saying that: "The production and construction sectors which are indispensable to the society and are of vital importance to the national economy and people's livelihood must be strictly subject to planned regulation, while the remaining sectors are to be regulated by market forces." On 27 August of the same year, in my speech to the participants of the third seminar I again mentioned that combining planned regulation and regulation by market mechanism was a new proposal insofar as its formulation was concerned; but as regards the way of doing things, it was not unfamiliar to the comrades who had been doing economic work for a fairly long period of time. When Comrade Chen Yun was in charge of all the economic work of our country, we worked exactly in this way. In the same speech, I suggested that we should again seriously study the speech that Comrade Chen Yun made at the eighth party congress, especially the well-known part revealing how Comrade Chen Yun envisaged the pattern of our socialist economy, which included: "Planned production constitutes the body of our industrial and agricultural production, and free production which operates in accordance with market trends and within the limits allowed by the state plan is complementary to planned production." I also mentioned: "We have been doing economic work first this way then that way. But it appears that we must again go along the road suggested by Comrade Chen Yun many years ago."

In the two speeches, I also touched on another issue: Since our production as a whole is commodity production, we have to decide, both for the sectors subject to planned regulation and the sectors subject to regulation by market mechanism, whether a production unit should have power and how much power it should have. In order to engage in commodity production, we must admit that the law of value performs a regulating function in the production field, admit that enterprises should have various degrees of autonomy within the framework of the state plan, and admit that they may have, to various degrees, their own material interests. That is, we must admit that they are commodity producers enjoying relative independence.

Since the 3d Plenary Session of the 11th CCP Central Committee, pursuant to the policies of the party Central Committee, we have implemented many forms of the production responsibility system. In the cities, a number of enterprises have been given greater autonomy on an experimental basis, the collective economy has been greatly boosted while the individual economy has been suitably developed; and the financial system has undergone its first reforms. All this work has contributed remarkably to boosting the industrial and agricultural production and the whole national economy of our country. During this period good experience was acquired while many new problems, which have to be solved in earnest, cropped up. This period has also provided us with the possibility of finding a more scientific solution to the problem of a planned economy which also has regulation by market mechanism. The Central Committee's working conference held in December 1980 resolved to adopt an important policy: on the political side, to enhance stability and on the economic side, to pursue readjustment. The "Resolution on Certain Questions in the History of the Party Since the Founding of the PRC" passed by the 6th Plenary Session of the 11th CCP Central Committee summarizes the experience we have gained from practice since the founding of our country, especially since the 3d Plenary Session of the 11th CCP Central Committee. As regards planned economy and regulation by market mechanism, Comrade Chen Yun suggested during the discussions that the formulation in the draft resolution should be amended to "it is necessary to realize a planned economy on the basis of public ownership and at the same time make use of the market as an auxiliary regulating instrument." He also told the comrades drawing up the draft that we needed to bring about a brisk economy but we should be careful not to forget the planned economy while doing this. At a meeting of the party's first secretaries at provincial, municipal and autonomous regional levels held in December 1981, and in his talk with the comrades in charge of the State Planning Commission during this year's Spring Festival, Comrade Chen Yun again emphasized that both in industrial production and in agricultural production, we should uphold the basic principle of letting the planned economy play the principal role and letting regulation by market mechanism play an auxiliary role. Whether in construction and life or in accumulation and consumption, we should act according to plan. Facts have proved that, in comparison with the formulation of 1979, Comrade Chen Yun's suggestions and opinions, which have obtained the unanimous approval of all the top-ranking members of the Central Committee, better suit the socialist economy of our country and can better ensure that our economy will develop in the direction of socialism. This is a basic principle that we must uphold from now on.

In his report on government work, Comrade Zhao Ziyang gave good play to this important principle laid down in the "resolution." He divided enterprises and products into four types and put forward four different management methods as well. The first type comprises the key enterprises which are of vital importance to the national economy and the major products indispensable to the people's livelihood, and production of this type of product should follow the state's instructive plans; the second type comprises a large variety of small commodities, the production of which is scattered among many small enterprises and individual workers. For this type, production may take place according to market trends and within the limits allowed by the state plan. Between these two types, there are another two types of enterprises and products. For one of the two types, the major part of the production should be carried out according to the state plan while a small part can be organized by enterprises themselves; for the other type, the major part of the production is to be organized by enterprises in accordance with market trends while a small part should be carried out according to the state plan. The products mentioned here cover not only industrial products, but also agricultural products. For agricultural products, planned production should also play the principal role while free production may play an auxiliary role. Of course, the classification put forward by Comrade Zhao Ziyang needs to be elaborated if we are to apply it to practical work. For instance, what kinds of enterprises are key enterprises of vital importance to the national economy; what kinds of products are indispensable to the people's livelihood and what kinds of products are small commodities; how do we ensure that production carried out according to market trends will not exceed the scope allowed by the state plan, and so on.

Comrade Zhao Ziyang has said that the above-mentioned management system differs "both from our past system, which was overcentralized, and from the market economy of the capitalist society. It enables us to combine centralized and unified leadership by the state with an enterprise's initiative, really succeed in bringing about an economy which is kept under control without being irresponsive, which is brisk without being confused. Thus we may raise economic efficiency and organize and develop production according to the needs of society." In the past, we tried to put everything under state planning. As a result, on the one hand, our planning lost its scientific nature because we attempted to do the impossible and our economy was very irresponsive. On the other hand, things which could have been done were not done well, with the result that the national economy was only semiplanned most of the time. Why did our national economy become disproportional more than once? Although errors in policymaking were the main reasons, we must realize that overcentralization of our planning and management system was also a direct cause.

We must get rid of this cause of economic ills while reforming our system. But the purpose in getting rid of this cause is to strengthen the planned economy, rather than weaken it. Some comrades have criticized the view that only mandatory targets assigned by the state are of a socialist planned economic nature. Therefore, these comrades have advocated abolishing mandatory plans. It is necessary to make an analysis of how correct this criticism is. It does not seem wrong to regard mandatory plans as the basic characteristic marking the socialist planned economy. A planned economy means nothing other than a national economy consciously managed by society according to plans set down beforehand. This kind of economy is bound to appear in order to meet the objective demands of a society in which all the means of production have reverted to the entire society's ownership and in which labor is joint labor within the scope of the entire society. Under these conditions, the society (represented by the state or economic centers) is the owner of all the production units, which should carry out production and management according to a unified plan drawn up by society. Does our country have conditions for realizing a planned economy? Yes. Management by the state of the enterprises which are of vital importance to the national economy, control by the state of the products indispensable to the people's livelihood and mandatory plans imposed on this part of production, which takes up most of our total industrial and agricultural output value, prove that our economy is basically a planned economy. Abolishing mandatory plans can at best coordinate, only to a certain degree, the production and activities of various enterprises as the capitalist countries do by their planning. This kind of "planning" cannot prevent the production of society from falling into a state of anarchy and therefore is by its nature totally different from our planned economy.

In order to ensure harmonious development of the national economy, it is necessary to make planning more scientific. The socialist economy can develop according to plan and must develop according to plan. But this is possible only if there are plans elaborated by the state which satisfy the demands of objective laws. Therefore, working out state plans on a scientific basis is an important condition for the development of the socialist economy. What about our past planning? We cannot say that it satisfied none of the demands of objective laws; neither can we say that it satisfied all the demands of objective laws. As a matter of fact, fairly often it did not satisfy many demands of objective laws. Without highly scientific planning, it is quite unlikely that we can ensure that the two production sectors of society and the various national economic sectors will be in good proportion to each other, and it is quite unlikely that the economy will develop without a hitch. In cases where plans depart greatly from scientific criteria, they cannot be implemented and therefore come to nothing. Since the 3d Plenary Session of the 11th CCP Central Committee, just like what has happened in the whole national economy, we have greatly cultivated a realistic style of work in our planning work and the planning methods have also improved greatly. In future, we must keep working in this way so as to strengthen the planned economy and better bring into play the superiority of the socialist economy. Some comrades have confused planning work with the planned economy, doubted the superiority of the planned economy for finding errors in our past planning work, and some others have even denied the value of the planned economy. These views are wrong.

INTRODUCING 'A STUDY OF PROBLEMS IN CHINA'S SOCIALIST ECONOMY'

Beijing RED FLAG in Chinese No 6, 16 Mar 82 pp 37-39, 44

[Book review by Su Xing [5685 2502]]

[Text] Comrade Xue Muqiao's book "A Study of Problems in China's Socialist Economy" probes into the economic laws of socialism and is based on the actual conditions of socialist construction in our country. Because I and several comrades took part in the discussions and revisions on the original manuscript, we wish here to introduce the book briefly to our readers.

I. Probing Into the Economic Laws of Socialism Through Summarizing Past Experiences

Comrade Xue Muqiao is an economist who has spent many years on practical economic work and who has engaged in rather extensive research on economic theories. In the preface to the book "A Study of Problems in China's Socialist Economy," he told why he abandoned his plan to write a textbook and wrote this book instead. He gave two reasons for doing so: 1) The development of the socialist economy of our country has not yet reached the mature stage and an integrated theoretical system is difficult to create. 2) He has had more than 30 years of practical work in economics and had gained some understanding. He wished to make use of his later years to point out several problems in the actual practice of socialist economic construction which he thought should be immediately explored and solved in order to serve as references for theoretical workers and practical workers in the field of economics. These are precisely his book's special and superior points. It also explains why, although this book lacks an organized or close-knit theoretical system or background, it is well liked by all theoretical workers and practical workers in economics, including some foreign readers abroad.

In the history of mankind, a socialist society is a new social system. After making an analysis of the capitalist system by means of dialectical materialism and historical materialism and taking into account the direction of development of society following the collapse of capitalism, Marx and Engels foresaw a basic trend for the development of a socialist society. However, because there were no socialist countries in existence in their time, we cannot and should not, expect them to offer any systematic dissertation on the economic laws of socialism. Lenin led Russia's working class and other working people to establish the world's first socialist republic. It was through them that millions of people began practicing socialism. Soon after the victory of the October Revolution, Lenin pointed out: "So far as Russia is concerned, the time has passed for the academic discussion of the principles of socialism. I firmly believe that it will never return. Today is the opportune time to talk about socialism on the basis of experience." ("Collected Works of Lenin," Vol 27, p 480) In my understanding, discussing socialism on the basis of experience should include the exploration of the contents of the economic laws of socialism by means of summarizing past experiences. In this connection, Lenin himself set an example. Take, for example, the questions of commodities and money: Marx and Engels predicted that under socialism, commodities and money would not exist. Yet after the October Revolution, Lenin never advocated the immediate abolition of commodities and money. During the period of wartime communism, there was an attempt to probe into avenues of socialist production and distribution which excluded the circulation of commodities, but this exploration was soon given up and "state capitalism was changed into state-regulated commerce and currency circulation." ("Collected Works of Lenin," Vol 33, p 73) This represented a big evolution both in theory and in practice. It was a breakthrough in what had been foreseen by Marx and Engels. In fact, a new understanding was thus derived from the actual practice of socialism in Russia. This was that during the course of socialist construction, commodities and currency must necessarily be retained and commerce must also be retained. This represented one of Lenin's important contributions to Marxist political economics.

Despite the short length of time of socialist construction in our country, valuable experiences have been gained. Comrade Mao Zedong's economic publications, Comrade Chen Yun's economic writings, and Comrade Zhao Ziyang's 10 guidelines on economic construction which he advocated in the government work report made at the 4th Session of the 5th NPC were all produced on the basis of the summarization of experiences in economic construction in our country. They reflected from various angles the nature of socialist economic laws.

In summarizing experiences, we should summarize both their positive and negative sides. Generally speaking, if mankind's actions conform with objective laws and ultimately meet with success, then they are said to be positive experiences. On the contrary, if mankind's actions violate objective laws and end in failure, then the experiences gained can be said to be negative. When talking to some Soviet economists in February 1952, Stalin mentioned the view that, generally speaking, the working of all these laws could be perceived only when they were violated, and when they were violated, harm could not be avoided. Here, Stalin was emphasizing the negative experiences and overlooking the positive ones. As a matter of fact, when mankind's actions conform with the objective laws, the working of the laws can similarly be observed. This book is replete with instances of this kind. Such examples as the stabilization of commodity prices and the socialist conversion of the system of private ownership of the means of production in the 1950's and the economic readjustment of the national economy in the 1960's all conformed with economic laws and were positive experiences.

Does this mean that economic laws can be discovered merely by summarizing experiences? Not exactly. Laws are the essence of phenomena. They are "something solidified (preserved) in phenomena." ("Collected Works of Lenin," Vol 38, p 158) They cannot be discovered easily. We must go through practice and understanding, further practice and further understanding, and repeat this process many times, so that perceptual knowledge is upgraded to rational knowledge, in order to discover the essence of things and their inner relationships.

II. Proceeding From Reality, Pay Special Attention To Studying How Economic Laws Operate Under China's Historical Conditions

Chapter one of this book is entitled "Socialist Revolution and Socialist Construction in Our Country." Originally, there was no such chapter and chapter one comprised the present concluding observations. However, the author felt that the structure of this book should be based on actual conditions and not merely on laws. Hence, he rewrote this chapter and made it chapter one. This shows another feature of this book, namely, that it proceeds from reality and pays attention to the study of how economic laws operate under China's historical conditions.

At the time of the revolutionary war, Comrade Mao Zedong remarked that in order to win the war, not only should the laws governing wars in general be studied, but the laws governing special revolutionary wars and, in particular, the laws governing China's special revolutionary war should be studied. Just as in studying the laws governing wars, in attempting now to build a modern and powerful socialist country, we must study not only economic laws in general, but also special socialist economic laws, and, in particular, special socialist economic laws as manifested under China's historical conditions.

Take, for example, the law of production relationships conforming with the nature of the productive forces. This is a common economic law applicable to various production forms. It operates differently in different production forms. In analyzing the contradiction between production relationships and the productive forces under capitalism, Marx pointed out that owing to the socialization of production, the system of private ownership of the means of production must of necessity be replaced by the system of public ownership. As for how this replacement is brought about, this differs in different countries. For example, in the Soviet Union, the means of production owned by the capitalist class were confiscated by the state. We confiscated a portion of these means of production (those owned by bureaucratic capital) and purchased a portion (those owned by the national bourgeoisie). As for the cooperativization of the means of production owned by the peasants, our method and procedure also differed substantially from those of the Soviet Union. It seems that we have done slightly better in this regard. As a result, the recovery and development of our industry was relatively faster, while in agriculture we not only did not suffer any large decrease in production but production actually increased. Unfortunately, just because of this comparatively successful accomplishment, we became careless after 1958, when we lopsidedly exaggerated the role played by the change in the ownership system in the development of the productive forces. We stirred up "communist wind" and became "prone to boasting and exaggeration." Instead of developing the productive forces, we damaged them.

In chapter one of this book, the author makes an analysis of the special conditions for socialist revolution in our country. He wrote: "Originally in our country small producers commanded absolute superiority. Agricultural production relied principally on manual labor and retained a semiself-contained character. For this reason, the development of our socialist economy must be based on actual conditions. We must skillfully combine principle and flexibility. We should not be bound by existing conclusions or adopt in wholesale fashion the patterns already shaped by Marx, Engels, Lenin or Stalin." This point has an important bearing on understanding the nature of the society in our country at present. We cannot take as our pattern what Marx conceived of socialism in his "Critique of the Gotha Program" and take for granted that any form at variance with this pattern cannot be considered a socialist society. For some time to come in our country, varying economic forms will continue to exist, but since the public ownership system has already become the principal system of ownership of the means of production, this type of society should be classified as a socialist society. In the "postscript," the author states: "Historically, since primitive society there has never existed a social structure which has a so-called pure and unadulterated composition.... Up to the present, even in the highly developed capitalist countries, a large number of small producers still exist. People do not refute their capitalist status on account of their 'impure' composition. Why must socialist countries be 'pure' and 'double pure'?" What he said was reasonable.

III. Progress While Exploring

In the "final notes" of this book, the author introduces two different views by certain comrades concerning the time of the book's publication. One view is as follows: Since the discussions began on practice being the sole criterion for determining truth, in the theoretical field many new problems have arisen. Comrades engaged in economic work are still discussing the problems of readjusting the national economic and restructuring the economic management system. A hundred schools of thought presently contend. Many problems have not yet been resolved. It would be best to wait a while and watch for the conclusion of the discussions before making the manuscript final. The other viewpoint is this: The discussions on theory and practice will last for a long time and restructuring cannot be accomplished within 1 or 2 years. Why not take part in the discussions as "one school of thought"? Certain errors cannot be avoided but greater service can still be rendered to actual work. Following deliberations, the author decided in favor of the latter view. The attitude that the author assumed was down to earth. This is first because socialism, as a new social system, has not yet attained maturity. We cannot expect a mature volume to be written on a still immature system. Second, this is because we are still acquiring an understanding of the economic laws of socialism. Apart from us, other socialist countries are still acquiring such an understanding. It is impossible to expect every viewpoint to be comprehensive and correct. While exploring, mistakes are unavoidable. That we are still able to discover mistakes shows that we have made progress in understanding. There is nothing wrong in this.

This book contains theoretical viewpoints of an exploratory nature. They are what the author himself calls viewpoints "belonging to one school of thought." For example, the idea that the productive forces should in part belong to the individual occupies a rather prominent position throughout the volume. Some comrades agree with this view, some do not. His analysis of the reasons for the existence of commodities in a socialist society is agreed with by some people but disagreed with by other people. The author refuted the idea that renminbi could take the place of gold. He advocated that the standard for measuring the value of money should not be the price of one commodity such as gold but rather the composite price of a number of products (composite price index). He thought that this should be the new development of the currency system, but some people disagreed. Concerning these problems, the author stated the following in the "postscript" to his book: "For many years opinions on some theoretical problems (such as whether the productive forces should in part belong to individual laborers and whether the renminbi should take the place of gold) have differed among the academic circles in our country and abroad. On these problems I maintain my original views. But I am willing to follow the principle of letting a hundred schools of thought contend and to continue the discussions with comrades in the academic circles." Hence, when learning from this book we must also have an exploratory spirit. The existence of disparity in scholastic viewpoints does not hamper our understanding of the socialist economic laws. On the contrary, the controversies between divergent viewpoints can possibly enable our understanding to approach the truth more rapidly.

The book was published more than 2 years ago. Looking at it in the spirit of the 6th Plenary Session of the 11th CCP Central Committee, it seems that there is nothing wrong with its basic direction. However, there are certain defects and deficiencies and the presentation on certain problems was not comprehensive enough. Accordingly, last year the author wrote a "postscript" which touched on three problems. The first problem concerned the concrete forms of socialist production relations. On the basis of the spirit of the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC," he discussed the concrete forms of the production relations at the present stage in our country. He also made certain revisions and supplements with regard to the following two topics:

One topic was the agricultural production responsibility system. The original text touched on this topic rather casually, and on the question of assigning farm output quotas to each household it appeared to have been somewhat restricted by the viewpoints that had been in circulation in the last few years. The "postscript" made a rather clear presentation of the various forms of the agricultural production responsibility system. The other topic was the alteration of a former viewpoint which had emphasized that development of the collective ownership system must follow the procedure of a transition from ownership by the production team to ownership by the production brigade, and then to ownership by the people's commune. It was clearly pointed out that in some cases the development of the collective ownership system in the countryside could take the transitional procedure of going from small collectives to large collectives, but that in other cases this procedure need not be followed and that various new combination forms may be adopted. The second problem related to planned economy and market regulation. The reason why in the "postscript" the author took pains to dwell on this problem was that, for a period of time, in academic circles the discussion of combined planned regulation and market regulation was rather prevalent. (In this book the author himself refers frequently to this topic.) But this presentation is not exactly correct, because it places planning and market regulation in opposition to each other. The "resolution" did not put it this way. What it stated was: "The planned economy must be implemented on the basis of the public ownership system; at the same time the supplementary role of market regulation must be brought into full play." This version first of all affirms that the socialist economy is a planned economy and at the same time brings into full play the supplementary role of market regulation. It is more correct and conforms with China's realities. The third problem touches on readjustment and restructuring. Efforts are made in this to alleviate certain skepticism expressed abroad (and within the country) concerning the readjustment of the national economy in our country. In reading this book the readers, if interested, should also read this "postscript."

WHAT IS MEANT BY SMUGGLING AND WHY IS IT NECESSARY TO CRACK DOWN ON SMUGGLING?

Beijing RED FLAG in Chinese No 6, 16 Mar 82 pp 40-41

[Article by Xi Wen [0823 5113] in "Question and Answer" column]

[Text] Answer: Smuggling is an illegal economic activity. It generally refers to the act of violating the stipulated laws of the state and illegally transporting goods for import or export. Since the appearance of international trade in the world and the imposition of restrictions on such trade, smuggling has become a universal phenomenon in various countries and regions. Smuggling is not allowed by any sovereign state. Ours is a socialist country. Smuggling is all the more not allowed. The "tentative customs laws of the People's Republic of China" and the "penal code of the PRC" clearly say that smuggling is an illegal act of upsetting socialist economic order and impairing state interests. Smuggling in serious cases is an offense according to criminal law. According to these prescribed laws, all such activities as illegally transporting, carrying or mailing goods, silver and gold, currency, bills, negotiable securities and other commodities across the border in violation of state regulations governing foreign trade, imports and exports and customs duties are in the category of smuggling--activities prompted by attempts to escape customs inspection, illegal foreign exchange trading, and evasion of customs duties. Those who engage in smuggling and illegal trading are subjected to economic sanctions and are even punishable in accordance with criminal law.

For a socialist country like ours which lacks a high level of economic development, cracking down on smuggling is of especially great significance. At present, the prices of certain consumer goods in our country, such as wristwatches, radio-tape recorders, television sets, chemical fiber products, and so forth are much higher than those abroad. Meanwhile, the prices of gold and silver, jewels, rare medicinal herbs, cultural relics and curios are much lower than those abroad. These price differences constitute a great economic stimulation to smuggling. Since the founding of the state, smuggling has waxed and waned and has sometimes reached quite serious proportions. In the past few years, our country has carried out an open-door policy. This helps to attract foreign capital, equipment and technology and accelerates the readjustment of the national economy and socialist modernization. In the future, we must persist in carrying out this policy. Meanwhile, the international bourgeoisie and the smuggling rings based in Hong

Kong, Macao and other areas have also seized this opportunity to exploit any loophole that has appeared in certain aspects of our controls. They have acted in collusion with lawbreakers at home and practiced smuggling in a big way. Certain people of some enterprises, undertakings serving the people, organs, public bodies and rural communes and brigades in our country, including an extremely small number of leading cadres, have thrown party discipline and state laws to the winds, and relied on their authority and on state and collective funds to carry out smuggling and illegal trading. They have promoted bourgeois liberalization in the economic area. This upsurge in smuggling and illegal trading has done harm to the state and society in many respects. Smugglers have violated our regulations governing foreign trade and imports and exports and have secretly brought in large supplies of consumer goods not needed as imports by the state, including second-grade and slipshod goods and imitations. On the other hand, they have smuggled out the state's valuable products and rare commodities in large quantities, or have engaged in illegal foreign exchange trading. They have thus avoided paying large sums in customs duties and industrial and commercial taxes. This has resulted in tremendous economic losses to the state. Smuggling has interfered with our industrial and agricultural production and hampered the development of our relevant national industries. Smuggling and illegal trading have given rise to many other illegal and criminal activities and disrupted peace and social order. In a small number of coastal areas where smuggling is rampant, the number of cases of gambling, robbery, theft, fraud, bribery, fighting, beating, murder, and so forth have risen sharply. Smuggling has had a corrosive effect on the cadres and the masses and has corrupted social morals. Driven by a desire for exorbitant profits, some people have fallen prey to bourgeois sugar-coated bullets and stepped on the criminal path. There are still more people who have illegally bought smuggled goods as bargain hunters.

From this, it can be seen that smuggling and illegal trading are downright criminal activities that are the scourge of the country and the curse of the people. The struggle between smuggling and antismuggling forces is one between bourgeois corrosive and socialist anticorrosive forces. This struggle is not only a serious economic struggle but also a serious political struggle. Our country follows an open-door policy in a long-term guideline that cannot be changed. But we must guard against attendant negative influences. We must take note that though the exploiting class in our country has been eliminated, its influence has still not been eliminated. The international bourgeoisie is invading and corrupting our revolutionary ranks in the political, economic, ideological and other areas. Under this situation, if we cannot keep a clear head and take a firm stand in consciously resisting such intruding and corrosive forces and waging a resolute struggle against smuggling, illegal trading and other crimes in the economic field, this will be an open invitation to the dumping of commercial goods by the capitalist world. This will weaken the revolutionary will of our ranks, disrupt the political situation of stability and unity in our country and affect the consolidation of the socialist system.

Cracking down on smuggling, illegal trading and other criminal activities in the economic field is one of the central problems that the party is determined to tackle with intensified efforts this year. This also represents an important measure to achieve a decisive change for the better in the party's style and the social style this year. We must have thorough understanding of the serious harm which smuggling and illegal trading present to the party and the state, and persevere in fighting these criminal activities, in order to better implement the open-door guideline in the economic area and ensure the smooth progress of economic readjustment and modernization.

CADRES SHOULD BE TESTED ON THEIR THEORETICAL STUDY

Beijing RED FLAG in Chinese No 6, 16 Mar 82 p 41

[Selected letters from readers]

[Text] Theoretical study by cadres has been gradually stepped up since the 3d Plenary Session of the 11th CCP Central Committee. Considerable achievements have been made in this study as the units and individuals that have made good results in their study have continued to increase in number. But the progress is unbalanced; some units have let theoretical study drift, and they think that it makes no difference whether anyone studies or not and whether there are many or few people who take part in the study. Some other units that formulated plans for this study have taken a perfunctory attitude and consequently made no achievements. They considered such study as an important matter when they were mobilizing cadres to take part in the study, but they did not make proper arrangements and reduced the importance of the study in their actual work.

I think that to change this situation, it is necessary to step up education on the importance of this study, and what is more important is to establish an examination system for theoretical study. It is necessary to proceed from specific conditions and define the contents and requirements in the study and formulate related rules and regulations and a system. Like cultural and technical study, the achievements in theoretical study must also be considered as a criterion for testing, appraising, promoting and selecting good cadres. Study achievements must be appraised according to reality, and it is necessary to stress the importance of linking theory with practice and not just repeating statements. It is also imperative to produce research materials to enhance the study.

(Jia Jiajin [6328 1367 3866] of the Guangxi Zhuang Autonomous Region branch of the Agricultural Bank of China)

I suggest setting up an examination system for cadres' theoretical study, that advanced units and individuals be awarded, and that the attitude that it makes no difference whether to study or not and whether there are many or few people taking part in the study be changed. Following completion in the study of each subject or in a certain stage of the study, it is imperative for the higher management departments concerned to carry out examinations, with topics unifiedly defined and examination papers unifiedly checked. The results of examinations must be announced and included in the cadres' records. Those who have completed their study with good results must be awarded and given certificates and their study taken into account. Those who fail to meet the requirements must continue their study, and they will be permitted to move on to study the next subject only after they have met the requirements. The examinations must be based on high standards and strict demands; there should not be a perfunctory approach to them.

The cadres' theoretical study must be combined with their appointments, and their promotions must be based on the results of their study. All leading departments concerned must every year conscientiously check on the study of their cadres. In appointing cadres, these departments must regard the study of their cadres as an important content for deciding whether the cadres are competent. Those with excellent study results must be promoted.

(Li Guoyan [2621 0948 2513] of the Propaganda Department of Tangshan Prefectural CCP Committee, Hebei Province)

By the end of 1981, the Propaganda Department of the Yiyang Prefectural CCP Committee, Hunan Province, and various propaganda departments of the party committees and municipal party committees under the prefectural party committee conducted an examination of all their cadres on the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC." The examinations won active support from the leadership at various levels and the broad masses of cadres. They considered the examinations as a good opportunity for testing and improving their theoretical standard. With enthusiasm, they took the examinations and there were many moving deeds.

We found through the examinations that cadres' theoretical study must be carried out in a planned way and that it is necessary to give cadres coaching and establish an examination system. In fact, such measures are not new. During the early 1950's, there existed a complete examination system for cadres' theoretical study, but it was later misunderstood as "stressing application" and it was spoiled by Lin Biao and the "gang of four." Consequently, this effective method was abandoned. Also in the past we worked on planning for cadres' theoretical study. Much coaching was given and many reference materials were printed, and yet cadres were not enthusiastic about study. There even appeared a situation of letting the study drift. All this also contributed to the abolishing of the examination system. We hold that examination is an indispensable link in this study because it not only checks the results of study but promotes it. Recently, we conscientiously summed up the experiences and lessons in giving examinations and we have decided to continue the examination system and work to perfect it.

(Chen Daoyue [3088 6670 1471] of the Propaganda Department of Yiyang Prefecture Party Committee, Hunan Province)

A NEW DISCOVERY IN SUBJECT MATTER FOR FILM PRODUCTION

Beijing RED FLAG in Chinese No 6, 16 Mar 82 pp 42-44

[Article by Chen Bo [7115 2330]]

[Text] The film "The Herdsman" has been much talked about recently by many people on the ideological front, particularly film, literary and news circles. They have praised it as a good film. Why does this film have such extraordinary artistic power as to be warmly welcomed by the people and to draw their praise? It is because, with realistic images, this film is able to grip the vast movie-going public. With poignant artistic scenes, the film vividly summarizes and portrays the conflict and contradictions of two different destinies, two different prospects, and two different ethical ideologies and world outlooks.

Xu Lingjun, the protagonist of the film, is an intellectual who was wrongly labeled a rightist. He is a primary school teacher on the grassland. His father, Xu Jingyou, the chairman of a big company, returns home from abroad and asks Xu Lingjun to follow him by entering the family's bourgeois business abroad, but he resolutely turns down the offer. Xu Lingjun is able to do so because he has linked his personal destiny and future with the destiny and prospects of his motherland. Consequently, his socialist ideology of loving his motherland overcomes his father's capitalist ideology of wanting his son to "follow in his footsteps" and to engage in an adventurous career by severing his fate and future from that of the motherland. The struggle between the two different destinies and prospects and the ideological struggle are the theme of the film.

Following is some of the dialogue between the father and the son in a Beijing hotel:

Father: "The San Francisco Chemical Company in the United States is my kingdom. People abroad are seeking personal fame and they engage in competition."

Son: "Dad, you've your own feelings about fame. Maybe because I'm used to collective life that I value the fame of our country."

Father: "Do you herdsmen usually read Marxist books?"

Son: "These kinds of books are printed in great number in China, so we have the chance to read them."

Father: "Now people in Western countries are also studying Marxism, even more than in China."

Son: "That is right, but they are studying from books and we in China--Dad, please don't talk about it!"

A moment later the father says: "What are you thinking about? The policies of the Communist Party can easily change. Now it is easy to get an exit visa, but it is hard to tell what it be like in the future." "Why is it so difficult for you to leave? You've suffered enough for 20 years."

This suffering refers to Xu Lingjun's being wrongly labeled as a rightist and sent to the grassland to be "reeducated through labor." Xu Jingyou thought that his words would hit the open wounds of his son's soul and so he continued his attack, saying: "I want to raise you up and restore your value as a man! I want to establish your belief! I...." He wanted to win over his son by projecting on him his own bourgeois personality and capturing him by using his own bourgeois ideology.

As for Xu Lingjun, he understands through his life experiences that the true current, true progress and true beauty of his life all come from his motherland. He found such feelings and belief from the laboring herdsmen on the grassland. Among these laboring people are Uncle Dong Kuan and his wife, who treated him as if he were their son, and Guo Pianzi and his wife, who took care of him as if they were his brother- and sister-in-law. This is a new moral principle which could only have been derived in a socialist country, and the laboring people's concern and love for an intellectual could only have developed in a socialist country. This situation is beyond the comprehension of Xu Lingjun's capitalist father. In particular, the film recalls Xu Lingjun's act of "marrying first and later falling in love" to vividly expound a new moral principle. A famine-stricken girl, Li Xiuzhi, fled Sichuan Province and came to Xu Lingjun's house. She could not have foreseen that Xu would respect and care so much about her. Extremely moved, she pinned her trust, hopes and happiness on him. This part of the story is unfolded exquisitely and thrillingly to present to the audience Xu Lingjun and Li Xiuzhi, who were strangers to each other and who in the tortuous path of the progress of their motherland met with misfortune, which only added luster to their lofty morality and beautiful souls. On such a foundation, they grew to know and love one another even more deeply after they were married. When they were married, their neighbors came to congratulate them. The herdsmen happily helped them and gave them cloth and grain coupons without leaving their names. Such a natural expression of the lofty morality of the laboring people vividly demonstrates the new socialist morality and ethics. This situation is in sharp contrast to the ethical standard of selfishness of the millionaire Xu Jingyou. After they were married, their life of labor and love continued to grow; they enjoyed happiness together with the laboring people, and they linked the fate of their family and lovely son with the prospects of their motherland. This situation is beyond the comprehension of Xu Jingyou and his female secretary. The secretary was staggered to learn that Xu Lingjun had married first and then fallen in love, and that following the redressing of his case, he was willing to spread culture by working as a primary school teacher. She came to realize that he was a man with resolute, firm and calm character. She thought that should Xu Lingjun become the successor of Xu Jingyou, he would be able to win fame for his father, the chairman. Consequently, she urged the chairman to grasp well his "investment in talent." She considered the great socialist motherland from a wrong angle; her understanding of Xu Lingjun, who had been nurtured by the motherland, was also wrong. The film skillfully uses flashbacks to express the answers given by Xu Lingjun through his interesting discussion with his wife on the grassland. What Xu Lingjun had in mind was expressed through the words of his wife, Li Xiuzhi:

Xu Lingjun: "Why? You think I can't leave you, don't you?"

Li Xiuzhi: "I've no such thought. I know that you would hate to leave the children in the school, the countryfolk, and Uncles Guo Pianzi and Dong. You would also hate to leave that (pointing to a national map on the wall).... Well, you can put it in your pocket and take it along, but it's only paper. You can't carry Qilian Mountain, nor can you carry the grassland."

Such is the socialist morality of Xu Lingjun and Li Xiuzhi, and it is a vivid display of their true souls. The screenwriters and producers of the film used such vivid language to counter the intention of the chairman and his secretary of "investing in talent" and their ethical concept of "the son following in his father's footsteps." Xu Lingjun said to his father: "Men do not live just to enjoy material life"; "Our motherland is now taking the correct road and I'm willing to climb this slope together with the people." Failing to understand his son, the father asks: "Is there such a strong attractive force?" He answers with deep feelings: "You can't but share the excitement of the people who witnessed their country rising above the blood and turbulence!" These are not only the words of Xu Lingjun; they represent the feelings of the broad masses of people.

The bourgeois mode of life is nothing but the pursuit of money, and their morality is to make profit and harbor egoism. According to the bourgeoisie, men are always selfish; others are eliminated in competition and exploited, and it is justifiable to enjoy happiness from the miseries of others. This is the ethical principle of Xu Jingyou and his like. The moral principle represented by Xu Lingjun and Li Xiuzhi includes ardent love for the motherland and socialism, sacrificing themselves for the interest of the people, and their true love and support of each other. Last year the film "House Full of Happiness" opened up a new world of ethical subject matter for film production, while this year the film "The Herdsman" resulted in a new development in this direction; the film production situation is very encouraging. To advocate new socialist moral principles and develop creative works around this theme are very important tasks for building socialist spiritual civilization, and such works have a wide range of content. We must continue to create artistic works and make further progress!

Some people hold that in the film "The Herdsman" the thinking and deeds of Xu Lingjun have been glossed over and beautified and the description has been "idealized." Therefore, the film is not realistic. By "reality" these people mean that Xu Lingjun must go to the United States with his father, who once abandoned him to enter business and become a capitalist. Of course, we must understand that following the implementation of the open-door policy, some people who are not resolute will yearn for the bourgeois way of life because of the penetration and influence of capitalist ideology. But can we consequently say that the man like Xu Lingjun is not true to life? No, that is not so. In fact, there are people who were wrongly labeled as rightists during the broad antirightist campaign and persecuted during the 10 chaotic years, but who have refused the invitations of foreigners to teach abroad; there are people who were teachers and artists in other countries but refused to stay abroad even though they were offered jobs with high salaries. Some Overseas Chinese with particular knowledge have returned to China to live a hard life in order to contribute their specialized knowledge to their motherland. A girl from the rural areas was asked to stay abroad and was offered a high salary when she was visiting the United States to demonstrate drawnwork handicraft techniques, but she refused. A chef from China who gave demonstrations in the United States was asked to stay there with a monthly salary as high as several thousands of U.S. dollars, but he refused. Some of our scientific and research personnel who are studying abroad have won high prestige through their own creations and inventions, and consequently foreign universities have vied with each other to win them over by offering them positions as professor, but they said that their careers are in their motherland. All this happened recently. Generally speaking, they are not just individual examples, but are representative of the true nature of our life. In the film, Xu Lingjun is a typical character that has been concentrated, extracted and created by writers and artists from the current reality and the masses. How can we say that the film glosses over reality? How can we say that the character is "not true to life"? Comrades who put forth such opinions have either departed from reality or do not really understand the revolutionary and realistic creative method of culture and literature.

If we say that there are some shortcomings in the film, we must say that these shortcomings lie in the fact that Xu Lingjun's ardent love for herdsmen, horses and the grassland, his great ideal of building the grassland and his lofty moral spirit are not fully presented. Artistically speaking, the description of revolutionary romanticism such as depicting many scenes of the vast grassland and of galloping horses and the description of Xu Lingjun's ardent love for and great ideal of building the grassland are not enough. The reconciliation between Xu Lingjun and his wife would be depicted more profoundly and movingly if this scene were changed from Xu Lingjun's giving his savings to Li Xiuzhi to cover her travel expenses and seeing her off to his returning home to find here there. Such a scene would serve to depict the change in the feelings of the couple. The film uses narration to interweave flashbacks with subjective monologues and reality, and this is no doubt a probe into a new method of film production and, therefore, merits trying. But some scenes are difficult for the audience to follow.

"The Herdsman" was shown in Beijing in the spring of 1982, and we warmly welcome it. With this film taking the lead, we believe that our film production will be able to meet the expectations of the party and the people and "persist in the method of 'one divides into two' and make further progress" so that more good films will be produced.

ANALYSIS OF THE SOCIAL WELFARE SYSTEM IN DEVELOPED CAPITALIST COUNTRIES

Beijing RED FLAG in Chinese No 6, 16 Mar 82 pp 45-48

[Article by Yao Tinggang [1202 1694 4854]]

[Text] After the great crisis of 1929-1933, which shocked the capitalist system, and especially after the end of World War II, the monopoly capitalist class in capitalist countries embarked on a social welfare system. This system can generally be divided into two parts--social security programs and welfare subsidies. Under the social security programs, it is compulsory for all employed workers to contribute a part of their income regularly to pay their insurance premiums (or social security taxes), which in turn forms the basis for social security funds. Social security includes insurance against old age, unemployment, disability, industrial injury and medical expenses. Under old-age insurance, the insured can retire upon reaching retirement age and can receive pensions if they had paid premiums for a given period. Under unemployment insurance, the insured can apply for their unemployment allowances for a period of half a year or 1 year. After this period, if they are still jobless, they can apply for welfare subsidies. Under disability insurance, insured workers can draw disability or disability allowances if they fall ill or become disabled. They can receive allowances until they recover or die. Under industrial injury insurance, compensation is available to insured workers or their families upon their death if they are the victims of industrial accidents or if they suffer occupational diseases. Under health insurance, insured workers can receive reimbursement of part or all of their medical expenses. In general, welfare subsidies come under government appropriations, and can be considered as a kind of social relief. They are mainly: 1) allowances for people who lose their source of income because of old age, disease and disability or people who are old, weak, sick or disabled and live below the minimum standard of living although they might receive retirement pensions; 2) family allowances, which help low income families to bring up children; 3) rent allowances, which supply low-income people with subsidies or loans to pay their rents; 4) other items, such as student allowances, food allowances, lying-in women allowances, and so on.

The welfare and treatment of working people in the major capitalist countries have truly been improved since World War II, but does this mean that the exploitative nature of capitalism has changed and that the proletariat is no longer exploited? To examine this issue, we must take the Marxist viewpoint to analyze and arrive at an answer.

1. When adopting widespread social welfare policies, the monopoly capitalist class does not proceed from a sense of benevolence, but aims at mitigating class contradictions and consolidating its rule.

In 1929-1933, an unprecedentedly severe economic crisis occurred throughout the capitalist world, and it shook the capitalist system to its very foundation. Widespread unemployment and the resulting poverty caused by the crisis drastically sharpened the class contradictions in capitalist countries. Working people rose up to fight against capitalism everywhere. The revolutionary movement was then on the upsurge. In order to mitigate the class contradictions and to save the precarious rule of the monopoly capitalist class, the theory of the welfare state based on welfare economics and Keynesism emerged. This theory held that capitalist states should adopt suitable tax policies, redistribute national income, and implement social welfare policies, including social security and unemployment allowances, so as to promote economic prosperity. Under the stress of circumstances and the pressure of the working people's struggle, the monopoly capitalist class could not but adopt these measures and embark on social welfare policies.

After the end of World War II, new conditions arose. First, the proletariat in capitalist countries were further awakened and waged political and economic struggles on a magnificent scale. Awestruck by the growing strength of the proletariat, the monopoly capitalist class had to make some concessions and gradually expanded social welfare measures. Second, owing to the third scientific and technological revolution, productivity in developed capitalist countries was greatly improved in the 1950's and 1960's. This made it possible for the capitalist class to give better wages and welfare treatment to the working people, because the relative surplus value and exploitation rate were being raised. Third, great development was made by multinational corporations, which have subsidiaries all over the capitalist world. The profit rates of their investments in developing countries are much higher than those in their own developed countries. Thus the capitalist class of developed capitalist countries can rake in superprofits, and can give the workers in their own developed countries higher wages and better welfare.

2. Implementation of the social welfare system is necessary for the monopoly capitalist class to grab higher monopoly profits and to maintain its class interests.

Engels pointed out long ago, "The bourgeoisie can also pretend to be merciful, but only when it is necessary to maintain their own interests." ("Collected Works of Marx and Engels," Vol 2, p 568) When high surplus value is guaranteed, the monopoly capitalist class finds that it is necessary to expand social consumption, so that they can free themselves from the plight of production stagnation. When economic crises occur, by utilizing this social welfare system, which can function as an "automatic stabilizer of the economy," state monopoly capital can mitigate a crisis and shorten the periods of crisis. The bourgeoisie also use all kinds of terms stipulated in the social security programs to fetter the workers, preventing them from taking part in strikes and political struggles. Through these tactics of drawing popular support, they can lull the fighting will of some of the workers and foster reformist and revisionist ideological trends in the worker ranks, so as to delay the emergence of revolutionary upsurge. Capitalist parties and politicians also use the improvement of the welfare system as one of their slogans in election campaigns in order to gain votes.

While implementing the social welfare system, the monopoly capitalist class tries its best to make this system bring more benefits to the higher income groups and to the exploiters. For example, there is a salary cutoff for the social security tax in the United States. As a result, low-income people find that their entire salaries are taxable, but for people in higher income groups, a part of their income is not taxable. In fact, this can be called "reverse progressive taxation." Besides, income from dividends, interest and rent are not necessarily taxable. People who have high incomes can also open "individual retirement accounts," by which they can save a large portion of their income from taxation and reserve this money for their retirement. Furthermore, government employees at all levels, especially congressmen, high-ranking officials, judges and career soldiers, enjoy a retirement system with excellent pay and other benefits. Even the famous American economist Milton Friedman could not but concede that the social welfare system in the United States "harms people in low-income groups and benefits people in middle- or high-income groups." Similar situations exist in other developed capitalist countries.

3. In developed capitalist countries, the social welfare expenditure is, in the end, a burden on the working people because of high tax rates and high prices.

In developed capitalist countries, working people in general pay their insurance premiums or social security taxes on a monthly basis, which guarantees their being entitled to certain benefits. Because of the expansion of social security coverage, the relaxation of insurance compensation conditions, the drastic increase in the amount of compensation due to inflation and poor management, the rates and amounts of premiums and insurance taxes have increased rapidly. In 1980, workers in the United States had to pay social insurance tax at a rate of 6.13 percent, as compared with the rate of 1 percent in 1937. The maximum taxable yearly income also rose from $3,000 in 1937 to $25,900 in 1980. The British national insurance program of 1979 stipulated that workers at the ordinary income level (weekly income from 19.5 to 135 pounds) should pay 6.5 percent of their income for insurance. In 1979, West German workers had to pay 9 percent of their wages for retirement insurance and another 5.65 percent for health insurance.

Of course, developed capitalist countries generally stipulate that both employers and workers should pay half of the various social insurance premiums. That part of the premium paid by employers seems to be paid by the bourgeoisie, but in fact it is also part of the value created by working people. Capitalists can always use such methods as forcing wages down or hiking prices up to shift these expenses onto the working people.

Expenditures on all kinds of social welfare benefits derive in part from the insurance premiums paid by employers and workers; the other part is derived from the state treasury. But the welfare subsidies and relief funds paid to people in the low-income and poverty categories are totally derived from the state treasury. This part appears to be given by the ruling class. In fact, capitalist states raise these funds by increasing taxes; in the final analysis, it is still the working people who bear this burden. In the United States, all kinds of taxes accounted for 31.2 percent of the workers' taxable wages in 1977. Sweden is famous for its comprehensive welfare system, but its tax rates are also terribly high. In 1980, a single, low-income Swedish worker with a yearly wage of $15,000 had to pay one-third of his income in taxes; as for people whose yearly income is higher than $15,000, one-half of their income has to go to pay taxes.

In spite of continuous increases in taxes and tax rates, revenues in the budgets of developed capitalist countries still cannot cover expenditures; huge deficits are a common phenomena. As a result, inflation is getting worse and worse, and commodity prices are becoming higher and higher. In fact, inflation and high prices are a kind of special taxation, by which, monopoly capitalist governments can further squeeze the working people.

It thus can be seen that, under the capitalist system, the social welfare funds are part of the labor force value created by workers in their necessary laboring hours. These funds are a part of the value of the means of subsistence, on which the worker can only maintain himself and his family at the basic standard of living. The only difference is that in the past these funds were managed by the workers themselves, but now a larger and larger portion of them is paid by monopoly capitalists in the form of welfare funds and fall under the unified control and management by the state machinery of state monopoly capital.

4. Although working people in developed capitalist countries have enjoyed high welfare benefits since World War II, this fact has not changed the exploitative nature of capitalism, has not mitigated the exploitation of working people, and still less has changed the exploited and enslaved position of wage workers.

As mentioned above, under the capitalist system, social welfare funds are part of the value of the workers' labor force. Guaranteeing the surplus value of the bourgeoisie is a necessary precondition for increasing these funds. Although social welfare funds have increased, the workers' working hours can still be divided into necessary laboring hours and surplus laboring hours. Thus the bourgeois practice of wringing out the workers' sweat and blood has not changed in the least. The workers' position of being exploited and enslaved has also not changed in the least. Long ago, Marx pointed out: "As better food and clothing, better treatment and more property could not eliminate the subordination and exploitation slaves suffered, the same change will also not eliminate the subordination and exploitation wage workers suffer. In fact, the increase in labor prices owing to the accumulation of capital only shows that the golden chains binding wage workers have become slightly looser." ("Das Kapital," Vol 1, p 678)

Furthermore, even an increase in social welfare funds cannot mitigate the degree of exploitation that workers suffer. Quite the opposite: by improving the welfare system, monopoly capitalists can mobilize the producers' initiative and improve productivity. As a result, the surplus value rate can be further raised and the degree of exploitation of the workers is also increased.

According to statistics, in the United States the workers' real income (nominal wages plus welfare benefits after deducting taxes and the effect of inflation) rose by 97.7 percent from 1948 to 1977. Of this income, the proportion of social welfare funds and capitalist enterprises' welfare funds rose from 9.4 percent in 1948 to 30.7 percent in 1977. However, in the same period, the proportion of workers' real income in the national income fell from 29.3 percent to 26.3 percent, but the surplus value rate rose from 236.7 percent to 280.9 percent. The workers' surplus laboring hours (on the basis of an 8-hour day) were correspondingly prolonged from 5 hours 37 minutes to 5 hours 54 minutes. According to Hans Tamel, an East German economist, the postwar surplus value rate in West Germany rose from 181.4 percent in 1950 to 260.0 percent in 1975.

5. Strict conditions are always laid down in the social welfare systems in developed capitalist countries; the amounts of insurance compensation and welfare allowances are too small to cover all the people who should be covered, still less to eliminate poverty.

The United States is the most developed capitalist country, but obvious defects and problems exist in its social welfare system. First, owing to harsh terms, many people, especially those in the poverty category, cannot draw any welfare allowances. For example, besides the retirees having to reach retirement age, pensions are only available to retirees if they had paid into the pension fund for a specified period of time. Disability terms are equally harsh, and a minimum period of paying premiums is required for those who draw disability allowances. Furthermore, only after being disabled for 6 months, can a person draw a disability allowance. Unemployment allowances are issued according to the beneficiaries' working time and their wage levels; these allowances are paid to them only for a specified period of time. But those who resign of their own accord and those who are dismissed for just cause are not eligible for unemployment benefits. Property ownership and income levels are strictly enforced to regulate welfare allowance eligibility. According to statistics, in June 1977, there were 7.7 million people who had suffered permanent disabilities in the United States. Owing to harsh terms, only 3.3 million of them could draw disability allowances. Second, there are some workers who are not covered by any social security measures. For example, in recent years, those covered by old-age and disability insurance only account for 90 percent of the employed workers. That means that there are still 10 million workers who are not covered. Many states in the United States exclude farmworkers, housewives and temporary workers from eligibility for unemployment insurance and industrial injury benefits. Except for those suffering from silicosis owing to having worked in coal mines, many people who contract occupational diseases cannot get any allowances. Third, the problem of guaranteeing medical treatment to those suffering from various diseases has not yet been solved. "Medicare" and "Medicaid" so far cover only a part of the medical expenses for old people and for low-income families with children. As for the health insurance of employed workers, premiums are generally paid by both employers and workers to some private insurance companies. The premium rates are very high, but the compensation only covers one-third of the insured medical expenses. According to statistics compiled by the U.S. National Institute of Health, even considering those insured by insurance companies, there were still 24 million Americans who were not covered by any health program, and another 20 million Americans who have a low level of health insurance coverage. Fourth, social security compensation and welfare allowances are very low. Unemployment allowances are generally equal to 40 percent of an unemployed person's former wages. Industrial injury benefits are only equal to two-thirds of an injured worker's former wages. According to statistics, a single American worker can only receive a pension equal to 31 to 58 percent of his wages before retirement. A married worker can receive a retirement pension together with his family allowance only equal to 47 to 78 percent of his wage before retirement. Therefore, many beneficiaries of social security and receivers of welfare allowances still live below the poverty line.

6. The social security system in developed capitalist countries is now facing a crisis. The monopoly capitalist class in some countries is trying to undermine the fruits achieved by the working people by long-term struggle.

As mentioned above, the major capitalist states raise their social security funds mainly by taxes. Although the rates of these taxes have been raised again and again, the state revenues still cannot cover the expenditures, thus causing these countries to face an inextricable crisis. For example, because of inflation and unemployment in recent years, the U.S. Government shifted part of funds for welfare allowances from the state treasury to the social security system. Coupled with other factors, such as the fact that the proportion of employed workers to retirees has declined, the growth rate of the income of social security funds is far behind the growth rate of their expenses. According to statistics, between 1977 and 1981, income for U.S. social security funds was $499 billion, but the expenditures of these funds were $540 billion, thus causing a deficit of $41 billion. In the current economic "stagflation," this is a prominent problem.

The fundamental reason for this stagflation lies in the basic contradiction in the capitalist system between the socialized production and the private ownership of the means of production. However, the monopoly capitalist class and its advisers attribute "stagflation" to the social welfare policies. They advocate that costly welfare programs have resulted in the weakening of the competitive power of their products on the international market and have fostered laziness and a dependent mentality among workers, thus lowering productivity and causing financial deficits and inflation. They maintain that the social welfare standard should be lowered and expenditures for social welfare items should be reduced. One of the major measures proposed in the "economic recovery program" of the Reagan administration is to reduce government expenditures, especially expenditures for social welfare programs. Other developed capitalist countries are also considering taking the same measures. If they really decide to adopt such measures and put into effect plans to slash social welfare expenditures on a large scale, they will not only find that they cannot free themselves from their economic plight, but, on the contrary, they will evoke stronger indignation and opposition on the part of working people, thus further sharpening class contradictions.

THE PARTY'S WORK STYLE SHOULD BE GRASPED IN THIS WAY

Beijing RED FLAG in Chinese No 6, 16 Mar 82 inside back cover

[Article by Zheng Nian [6774 1528]]

[Text] Recently a few localities achieved marked results and gained new experiences in grasping party work style. Their approach to dealing with unhealthy tendencies is not to be afraid of them and not to stall for time. Their methods are as follows: It is necessary to select an outstanding problem in the localities as a point of penetration; the leading bodies at various levels should set an example by each taking charge of the lower level, all the way down to the grassroots level; it is necessary not only to investigate and handle typical cases in earnest but at the same time put stress on ideological education. Evidently this is a good way for grasping party work style.

Some people say: "Unhealthy tendencies are like persistent ailments which are difficult to cure!" Not necessarily so. Whether they are "persistent" or "difficult" is decided by whether the leadership is determined to grasp them. If the leadership is determined to grasp them, they are neither "difficult" nor "persistent." If the leadership fails to grasp them, they are both "difficult" and "persistent." Recently a few localities conscientiously handled some typical cases. This news was published in the press. At the same time practical measures for checking these unhealthy tendencies were set forth and the leadership at various levels was instructed to implement them conscientiously. What with the resolute attitude on the part of the leadership and the effective measures and appropriate methods, the desired results were achieved very quickly, so that a healthy atmosphere prevailed and the unhealthy tendencies were visibly checked. The masses said: "So long as the leadership is not weak, it will be possible to improve party work style." The fact that they have won the very first battle is sufficient to explain that everything has a dual nature and that the unhealthy tendencies also have the aspect of a "paper tiger." So long as we can change the state of "being impassioned in speech, weak and flabby in action and softhearted in dealing with a problem," it is entirely possible to overcome them. In grasping party work style, it is no good to remain at the stage of issuing a general call. It is absolutely necessary to dare to grasp it and to grasp it firmly. So long as we can tackle a few issues and deal with them in a down-to-earth manner, we will be able to promote our work. Once the general atmosphere has changed, all "persistent" and "difficult" problems can be readily solved.

Other people say: "In order to check unhealthy tendencies, it is necessary to launch a campaign. Otherwise, there will be no possibility for improving party work style." The question now does not lie in whether we should launch a campaign but in whether we grasp party work style in earnest. In dealing with unhealthy tendencies, we cannot just sit and wait. We should go into action right away and wage struggles against them. It is necessary to sum up our experience in struggle and find out the ways to defeat them. The reason why the experiences gained in these localities are valuable is that they have proceeded from reality and struggled against the unhealthy tendencies by starting from grasping the outstanding problems in the localities. We should select the point of penetration well so that we can focus our attention on the main problem. When the leadership and the rank and file are of one mind and act in unison, it will be possible to change the situation in a very short time. It is necessary, in accordance with unified planning, to grasp, supervise and inspect the work from one level to another, and check it on schedule before acceptance. This will not only build up momentum but also enable the work to be carried out in earnest, thus giving full play to the power of the organizations. With respect to those people who dare to defy the law, it is necessary to deal with them according to law. By handling a case in this way, we will be able to reap the benefit of educating many people. It is necessary to hold organizational meetings well and solve the existing problems ideologically by discussing the harm and examining the ideological roots of the unhealthy tendencies. In the past some people held that it would have been "unreasonable" or "make things difficult" if they had not practiced unhealthy tendencies, and now they hold that by practicing unhealthy tendencies, they had "vilified the party, divorced themselves from the masses, and, if these tendencies were allowed to continue unchecked, they would adversely affect the four modernizations drive." In the past some people continued to complain about being wronged in their heart of hearts after they had made a "self-criticism" and returned what they had unlawfully taken or had paid compensation for; now they keenly regret their mistakes when they make self-criticisms and feel relief afterward. We have gained this enlightenment from these experiences: various localities should proceed from the local conditions, list the unhealthy tendencies about which the masses have many complaints, select a point of penetration and, after concentrating for a period of time to solve an aspect of the problem, go on solving another aspect of the problem. It is especially necessary to seriously handle major criminal cases regarding the economy and other aspects and to investigate and handle existing major criminal cases in the economic field in which some responsible cadres are involved. By constantly grasping the problem in this way, we shall certainly be able to drastically reduce the unhealthy trends and evil practices in the party, and a completely new situation in party work style will certainly emerge.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

SEVERAL QUESTIONS ON CURRENT ECONOMIC WORK

Beijing RED FLAG in Chinese No 7, 1 Apr 82 pp 2-10

[Speech by Zhao Ziyang at the national industrial and communications work conference on 4 March 1982]

[Text] The current national conference of industry and communications has discussed and studied measures for such issues as improving the economic results and doing a good job in this year's industrial production, communications and transport. Experiences in this regard have also been exchanged. According to everybody's view, the meeting is a successful one as it is held at an early date and it has a clear and definite guiding thought and a prominent central theme. Everybody maintains that this meeting will give a great impetus to this year's industrial and communications work. Now I would like to talk about the following questions:

I. On the Question of Raising Economic Results

On the basis of last year's remarkable achievements, our country has made further progress in industrial production since the beginning of this year. Judging from the results of January and February, the trend in production is good, and it is completely possible to fulfill this year's target of ensuring a 4-percent increase and striving for a 5-percent increase in total industrial output over last year. What we are afraid of this year is not about the problem of growth rate but about the failure to pay attention to economic results. It has been reported that there are still many cases of raising the quotas of output value at each level. While presenting the target of ensuring a 4-percent increase and striving for a 5-percent increase, the central authorities have already taken into consideration the speed of growth planned by various provinces and have incorporated this factor in the state's unified plan. However, certain localities and departments, while handing down the quotas, have raised the quotas at each level regardless of possibilities. Everybody wants to achieve a greater output value and speed up the growth. This is beyond reproach. During the period of readjustment, our country's national economic development must maintain a steady speed and we must not think that the slower the speed, the better. The issue is: We must unify speed with results. We must strive to attain the goal of having good results as well as a rapid increase in output value. It is certainly a good thing if such speed can be further accelerated; but if we only pursue output value and pay no attention to results, such a "speed" will do us more harm than good. Rather we should work in a down-to-earth manner so that our work will not be hindered by our seeking false reputation. The main problem now is not negligence of output value, but negligence of results. Certain localities and units have made much greater efforts to increase output value than to raise economic results, or they have only verbally claimed to raise economic results but have taken no practical and effective measures to attain the goal. The State Council maintains that it is necessary to emphasize correcting the guiding thought in industrial production. This is to say that we must stress economic results and a solid, not inflated, speed. This issue of having a correct guiding thought applies not only in industrial production, but also in capital construction, circulation and other fields of the national economy.

For a long period, we ignored benefits in blind pursuit of increased output in industrial production and did a great many foolish things. In the years after 1958 and during the "Great Cultural Revolution," the output figures were considerably inflated and waste was quite serious. The lessons in this respect are very profound. This problem continued after the smashing of the "gang of four." Although last year the figures were less inflated than in the past, many localities reported sharp increases in output values during the fourth quarter. This also caused some problems. Various provinces should figure out the extent of exaggeration in their growth rates in order to be sober-minded. Blind pursuit of increased output will necessarily result in the stockpiling of large quantities of goods. According to the data of the State Statistical Bureau, 58 major products were excessively stocked by commercial departments at the end of 1981. Output increase of certain products may be advantageous from the view of the part, but the result may be completely opposite if seen from the whole. For example, in east and northeast China where energy was already in short supply, some localities greatly overproduced for export ferroalloy and other products that consume large amounts of energy. This forced the east and northeast China power systems to generate more electricity than their capacity, or "eat their corn in the blade," as the saying goes, in order to meet the power and energy requirements. Such practices, if continued, will not only aggravate the dislocation but will also result in the recurrence of the past phenomena when "industry reported good news, commerce reported bad news, warehouses became overstocked and the financial revenue was zero." In the end, the banks were asked to issue notes to cover the deficits and the state and people suffered from it. If it was inevitable for us to do some foolish things in the past because of our lack of experience, we should have learned from them and become wiser. We must not repeat those foolish things of the past. Comrade Xiaoping has pointed out that to pay attention to economic results is an extremely important policy in all work. We should tap our potential and quicken our pace in raising the economic results. Last year at the Fourth Session of the Fifth NPC, the State Council put forth 10 principles for economic construction. The key point of these principles is to raise the economic results. Now that the NPC has approved these principles, we must fulfill them by our actions; they must not remain just words. This year we must have a major change and open up a new phase in raising economic results.

When we talk about economic results, it is first of all necessary to make clear one main point, that is, that we should spend as little living labor and as few materials as possible to produce still more products that meet society's needs. The first part of this sentence means that it is necessary to be as economical as possible and to reduce as much as possible the expenditure of living labor and materials. The second part of the sentence means that it is necessary to create more property for society, the key here being that the products must "meet the needs of society." It is not sufficient just to talk about producing more products, since that would not affect economic results. If the products are not what society needs, then the more we produce of them, the greater waste there will be. Therefore, the products we produce, including their quality, color, design and quantity, must meet the needs of society and be readily marketable. These needs are realistic and coincide with the actual level of investment and purchasing power. Society's needs are many-sided; they include the production needs and consumption needs and consist of demands in both of these two major categories. These needs change continuously with the development of production and construction and the improvement of the people's livelihood; there are different needs for different stages and each individual locality has its special needs. Whether we produce medium- and high-grade products or popular goods of dependable quality, we should always meet the needs of society. Only when the products meet the needs of society can the labor expended for these products win society's approval and can we have valuable and useful products instead of having wasted labor and useless articles. Our plans should proceed from the overall situation and take into account the future and the past; they should reflect as accurately as possible society's demands and meet the needs in the development of society. Only thus can we enable the national economy to develop in coordination with plans and in a proportional manner. If the products do not meet society's needs and are not readily marketable, there can be no proportionate and coordinated development. In our economic work in the past, what we neglected was exactly this fundamental point; consequently many problems arose. Producing more products that meet the needs of society with the expenditure of as little living labor and as few materials as possible is precisely what basic socialist economic law demands, and what the law of developing the national economy according to plans and in a proportional manner calls for. A socialist country should study the needs of society well and continually satisfy the needs of society; this is the aim we communists strive for. This guiding ideology must be firmly established. In handling economic work, the whole party should concentrate its efforts on saving as much living labor and as many materials as possible and on meeting the needs of society. It should make efforts to find new ways of raising economic results.

The question of raising economic results involves various aspects and is a considerably difficult question. As to why it is not easy to succeed in meeting the needs of society, there are two main reasons: One is limited understanding. Society's needs cannot be seen clearly at once, and it is especially difficult to see them clearly beforehand. It is usually when commodities go out of stock in the markets that their shortages are noticed, and it is usually when the warehouses are filled with stockpiled commodities that their excessive quantities are discovered. This demands timely understanding of the needs of society, understanding of market changes and trends, and improvement and enhancement of the level of planning work. The other reason concerns the question of interest relations. We should ascribe definite interests to enterprises and recognize and take care of the definite interests of localities. Failing to recognize such interests will result in eating "in the same canteen as everyone else," in which situation anyone can become irresponsible. When definite interests are ascribed to them, it will be easy for departments, localities and enterprises to determine their economic activities according to their interests. Some of the policy decisions of departments, localities and enterprises meet the needs of society, but others run counter to these needs. Although some products may not meet the needs of society, their production is carried on as usual; the plants share profits as usual; the localities receive a greater percentage of the profits and the commercial and supplies departments do not have to worry about overstocking of these products in the warehouses after their purchases because in the end they are completely taken care of by state finance. Consequently, falsehoods about output value continue protractedly without ever being resolved. Therefore, fundamentally, besides the demand that enterprises improve their business management and raise their scientific and technological level, raising economic results involves the questions of economic systems and economic structures and depends on the readjustment of economic structures and the reform of economic systems; there is no other way out. However, we cannot just wait and hold off our actions until the economic systems have been reformed and the economic structures have been readjusted. To solve this problem under the present situation in which system, structures and prices are all irrational, it is necessary to bring into full play the role of the leadership, namely, by strengthening guidance in planning and administrative intervention and strengthening supervision and inspection. An important task of the planning and economic commissions at various levels is to find out the extent of stockpiling, make a concrete analysis and seriously deal with it. If the products are needed by society but are stockpiled due to problems in the circulation of commodities, efforts should be made to actively strengthen marketing work and especially to open up rural markets or, in some cases, international markets. If the products are clearly not needed by society and are in the category of impractical goods from the view of the whole, administrative and economic measures should be applied. In such cases, administrative intervention should be firmly made without any fear of giving offense. If certain products are indeed overproduced, their production should be restricted. If certain products are temporarily in short supply, there is no need for us to rush headlong into producing them all at the same time. In stressing economic benefits, we should not only keep sight of the immediate benefits and the benefits to the part, but more important, we should not lose sight of the long-term benefits and the benefits to the whole. To make products meet society's needs--in addition to readjusting plans in a timely manner in light of market changes and intervening administratively and applying economic measures--it is necessary to strengthen market forecasting and improve planning work. At the same time, it is necessary to formulate and publish the economic and technical criteria for products and the criteria for factory construction as quickly as possible and strictly enforce this criteria in order to stop blind factory construction and blind production.

Bringing economic work to the path of raising economic results is the key to achieving a fundamental improvement of the financial and economic situation. We should spare no efforts to produce results in this regard. This is a new task for the vast number of cadres and workers on the economic front. It is also a new test for us all.

In the current industrial and communications work, the people's concern, as reflected in their reports, is concentrated mainly on energy and transportation issues. I will make three points: First, the coal, railway and communications ministries should make further efforts in carrying out the production, allocation and shipment of coal. Coal production was not bad in the first 2 months of this year and coal transportation was also good. But the implementation of the allocation plan was rather poor. Earnest measures should be taken to change this situation. Second, all localities should arrange their production in light of the energy supply situation. They should balance their industrial growth rates with the local energy supply; otherwise their goals will fall through. There are at present some localities that set very high targets for themselves and then ask the state to allocate more coal. This cannot be done. Third, energy supply cannot be expected to increase at present. The primary way out is to economize. It is necessary to save energy by every possible means. The energy shortage will not be resolved if we do not work to economize.

II. On the Question of Adhering to the Principle of Giving Highest Priority to the Planned Economy and Taking the Whole Country and the Overall Situation Into Account

Comrade Chen Yun recently made a series of important instructions on economic work. He once again stressed: Our country must adhere to the principle of giving highest priority to the planned economy with market force playing a subsidiary role. In national construction, the whole country and the overall situation must be taken into account. The fundamental policy that "first we must eat, second we must construct" must be implemented. He also pointed out that the first priority task of the special economic zones is to seriously sum up experiences These instructions all concern the major questions of principles and policies in economic construction and were put forward in light of the questions existing in our present economic life. They are of great immediate importance. They are in keeping with our economic policy of the recent years that calls for opening up our country externally and enlivening our economy internally.

Since the 3d Plenary Session of the 11th CCP Central Committee, under the unified leadership of the state and the guidance of state planning, we have enforced the policy of opening up our country externally and enlivening our economy internally. Our orientation is correct and our achievements are the main aspect. Without these reforms, we would not have the good situation we have today. This we must first affirm. However, in implementing the policy of opening up our country externally and enlivening the economy internally, we must be sober-minded and adhere to the aforementioned several principles put forward by Comrade Chen Yun, which are also the fundamental principles and policies our party has upheld for years. They must not be forsaken or be weakened. At present, while keeping sight of our achievements in opening up our country and enlivening our economy we must also be soberly aware that our opening up and enlivening will inevitably bring a number of problems. In this regard, we should have the courage to use the current favorable international and domestic conditions and continue to uphold the policy of opening up our country externally and enlivening our economy internally in order to promote our economic development. We must not waver over the established correct policy. At the same time, we must adequately recognize the problems brought about by this policy. We must not turn a blind eye to them or leave them alone. Today in stressing the need for giving highest priority to the planned economy and taking the whole country and the overall situation into account, our purpose is precisely to keep us sober-minded so that we can adopt measures to prevent the emergence of problems or resolve them if they have already emerged; to correctly and soundly implement the policy of opening up our country externally and enlivening our economy internally; to strengthen the position of planned economy; and to create conditions for further reforming our economic structure.

The purpose of our open-door policy is to introduce into our country foreign advanced technology and administrative knowledge as well as capital, which is useful to us in spurring our country's socialist construction. Because of the open-door policy, certain bad influences from capitalist countries will inevitably find their way into our country. Smuggling, peddling smuggled goods, speculation, swindling, corruption and accepting bribes have become rampant in certain localities and units; the capitalist living style and decadent ideology will corrode our party; certain weak-willed cadres will succumb to "sugar-coated bullets"; and our party members' work style and the people's habits may be contaminated. Our party, on several occasions in the past, when it carried out important new policies and faced new historical turning points, raised the issue that it was necessary to guard against capitalist inroads. One example was during KMT-CCP cooperation at the initial period of the war to resist Japanese aggression. The main problem needing to be resolved in those days was to combat factionalism and closed-doorism and open a new situation for the united front. At the same time, the party Central Committee explicitly pointed out that the CCP must maintain its ideological, political and organizational independence, adhere to the stand of acting independently and, keeping the initiative in our own hands, guard against problems generating from within our party. We did a very good job at that time. We took advantage of the favorable situation and, greatly expanding our strength, created a new situation. Instead of being corroded, our party become stronger. The second example was after victory in the liberation war. After acquiring national political power, our party members entered the cities from the rural areas and faced a dazzling world of humanity with its myriad temptations. In those days, the party Central Committee and Comrade Mao Zedong quickly reminded the whole party that it was necessary to guard against the attack of "sugar-coated bullets." Later, movements against the three and five evils were carried out. In those days, our party's political, ideological and organizational situation was very sound and we withstood the test.

Now we are taking advantage of the favorable international and domestic situation and are carrying out the policy of opening our doors to foreign countries and enlivening the economy at home, and we are facing another rigorous test. This time our party is confronting a much greater and more serious influence from decadent capitalist ideology at home and abroad, particularly the influence of international capitalism, than on the previous two occasions. Moreover, after a decade of turmoil, our party's fine traditions and work style have been impaired. Therefore, during this new historical period, it is all the more necessary to quickly alert all party members to the questions of capitalist inroads. By sounding this alarm we hope we can help our party members come to their senses, heighten their spirit and strengthen their will to withstand the test.

Today, smuggling, peddling smuggled goods, speculation, swindling, corruption, accepting bribes and other crimes in the economic sphere are much more serious than during the movements to oppose the three and five evils in 1952. The inroads of such crimes on our party organizations and cadres' contingents and their pernicious influence on the entire society are quite serious. This situation, if not struggled against immediately with determination, will develop from bad to worse in certain localities and will be unstoppable in 2 or 3 years. This is a prominent expression of the inroads of capitalist ideology under the new historical conditions--conditions of externally carrying out an open-door policy and internally enlivening the economy--and our struggle against all sorts of crimes in the economic sphere, is an important part in our allout struggle against capitalist inroads. This struggle is inevitable and is a protracted one. Just as Comrade Hu Yaobang pointed out: This is an extremely vital issue, which has an important bearing on our party's survival and on our country's prosperity or decline.

We must be fully aware of the seriousness, harmful effects and danger of the various crimes in the economic sphere and raise our consciousness of waging this struggle properly. If we fail to resolutely and powerfully strike at such crimes as smuggling, peddling smuggled goods, speculation, swindling, corruption and accepting bribes, not only will our building of a material civilization be seriously undermined, the building of a spiritual civilization will simply fail. Now the activities of rebuffing economic crimes are going on simultaneously with the "courtesy month" activities and the masses have acclaimed these activities and said our country is hopeful. All units on the economic front must resolutely carry out this struggle through to the end. By no means should they act perfunctorily or superficially. Of course, when we carry out this struggle we will not resort to the method of handling legal cases and exert special efforts to deal with major cases. This struggle will be carried out along with the overall reorganization of our enterprises and the general examination of financial affairs. We must, through reorganization and examination, find the clues, strengthen investigation, and track down and seriously handle the problems so as to strike at the criminals and educate our cadres. At the same time, we must establish and improve various rules and regulations and plug loopholes so that the criminals will not be able to avail themselves of them. Doing this will spur our efforts to improve management, economic accounting and economic results.

Another conspicuous problem is the recent growth of the trend toward departmentalism, decentralism and liberalism in the economic sphere. This is another major problem which has cropped up under the new historical conditions. We have domestically implemented the policy of activating our economy, delegated some powers to the local authorities and enlarged the enterprises' decisionmaking powers for the purposes of whipping up the enthusiasm of the local authorities, the various departments and enterprises and the masses, turning human talents and land and other material resources to good account and vigorously developing China's national economy. Efforts to expand decisionmaking powers and activate the economy are also apt to foster the trend toward departmentalism, decentralism and liberalism, to weaken and depart from the state's unified plan, to interfere with and break up the unified market of socialism and to affect our efforts to take the whole country and the overall situation into consideration. Instead of surveying and dealing with problems on the basis of the overall interests of the state, some localities and units take into account the local as well as their own interests. In dealing with the higher level, they disobey the unified plans of the state and seek private gain at public expense. In dealing with the units and other localities concerned, they shift their troubles onto others and harm others to benefit themselves. In conducting foreign trade, they refuse to implement the policy of unifying as one and joining efforts to deal with foreign countries, and jostle against each other. As a result, the foreign countries reap the benefits. There are presently still many signs of people carrying out construction and production blindly in disregard of the needs in society as well as the overall and long-term interests of the state. In some localities, the tasks for state monopoly and compulsory purchase have been shirked. Economic blockade between one district and another is fairly serious. There are many examples in this respect. Ours is a unified socialist nation. We must have a unified plan and unified domestic market. We must not allow one market for one province. If this practice is permitted, its political and economic consequences to our nation will be unimaginable. Also, for example, in the field of foreign trade, there is evidence of various districts, departments and enterprises vying with each other in cutting prices and counteracting each other's efforts. This has caused considerable damage already. The result is that by counteracting each other's efforts, the local authorities and enterprises reap some small benefits while the state suffers a great deal.

In order to strengthen centralization and unification in economic work, we must adhere to the overall plan on major issues while allowing freedom on minor issues. We must advocate centralism on major issues while allowing decentralism on minor issues. We must also correctly handle the relations between the practice of taking the whole country and the overall situation into account and the practice of whipping up local enthusiasm. The state must interfere with these erroneous practices and issue orders to eliminate them. It must not allow each one to pursue his own course.

1. In foreign trade, we must adhere to the policy of unifying as one and joining our efforts in dealing with foreign countries. After expanding the powers of the local authorities and various departments in conducting foreign trade, we must resolutely adopt effective measures to eliminate the

erroneous practice of vying with each other in dealing with foreign countries and in cutting prices. In foreign trade, it is necessary to appropriately expand the powers of the local authorities. However, at the same time, we must thoroughly solve the problem of selling products of the same category abroad in a unified manner. With a main port as a center, we must form a joint administration in exporting products of the same category in order to strengthen our coordination and management. After the powers in foreign trade are expanded according to district, the nine coastal provinces and municipalities in particular must exert still greater efforts in strengthening their unity in selling the products of the same category abroad, and thoroughly prevent each of them from forming an individual system in foreign trade so as to avoid disrupting their traditional and historical relations in coordination. The departments concerned must formulate necessary measures to strengthen coordination and unity with the support of central cities and main ports.

2. The products to be transferred according to state plans, including farm and sideline products, must be transferred strictly according to such plans. No one is allowed to retain them for his own use or to utilize them as a means of cooperation with others or to sell them at a negotiated price.

3. We must resolutely correct the practice of enforcing economic blockade between one district and another. Except for those to be allotted or delivered according to state plans, all products which have met the standards set by the state and those products produced in accordance with state plans are permitted to be marketed throughout the country. The enterprises are authorized to select and purchase the products themselves. The party and government organs in various localities must not interfere with the enterprises. If they do, the enterprises have the right to resist such interference.

It is necessary to care for old base areas, the regions inhabited by minority people and remote areas. It is necessary to provide technology and equipment to help these areas turn out products suited for local production and achieve even greater economic development.

4. The commodity price and revenue system must be centralized and unified. Without the approval of the State Council, no locality, department or unit is allowed to change a tariff rate or reduce or increase taxes. Without the approval of the State Council, the price of any product within the limits of state commodity price control must not be increased or decreased.

Comrade Chen Yun said: The task of top priority in the special economic zones at present is to summarize experience. I think the question of earnestly summarizing experience not only prevails in the special economic zones or in the two provinces of Guangdong and Fujian, but also in the whole country. All these reforms aimed at activating the economy at home and those within the foreign trade system must be reviewed and summarized to help us remain sober-minded and thoroughly solve the problems which have cropped up so that the reforms within the economic system will be healthily and extensively developed. For example, we must advocate the expansion of the enterprises' decisionmaking powers and the implementation of the economic responsibility system. However, we are indeed faced with the question of how to divide profits. We must carefully study how to take into account the interests of the state, the collective and the individuals simultaneously and to determine the share belonging to the state, to the enterprises and to the individuals as well as the most appropriate form of distribution. After the expansion of the enterprises' decisionmaking powers, we must also strengthen the management and supervision over such enterprises accordingly. To let the local authorities adequately share some powers is necessary. However, we must study how to avoid setting up economic blockades between one locality and other, and keep from following the trends of departmentalism and decentralism that may possibly prevail and how to prevent such trends from affecting the necessary practice of centralism and unification in China's economic work and to keep them from influencing the country as a whole. On the one hand, the foreign trade departments must pay attention to bringing into full play the enthusiasm of the units at all levels. On the other hand, they must also prevent themselves from competing against and undermining each other in front of foreign businessmen. In this respect, we must also earnestly sum up our experience. In short, the open-door policy in foreign trade and the policy of enlivening the economy domestically will not change, and the orientation for carrying out reforms remains firm. However, we must pay full attention to existing problems and sum up our experience and lessons. We are doing this precisely because we seek to do a still better job in enforcing reforms from now on.

The tentative plan for reform is:

1. The economic policies that have been put into practice generally will not be changed this year in order to maintain their stability and continuity. As far as the policy on economic results is concerned, the practice and level prescribed by the government last year should be generally maintained in terms of economic relationships between the state and the enterprise, and between the state and the enterprise on the one hand, and the individual on the other. However, extreme irrationalities in some individual units should be appropriately readjusted.

2. This year we should also consider what is to be done next year. By summarizing our experiences, we should put forward our views on how to complement, perfect or readjust the implemented policies and measures for next year. There appear to be three situations in this regard, one being that in which policies and measures which are effective and correct in orientation should be upheld. Another situation is that in which some policies and measures are correct in orientation but have side effects. These policies and measures should be continuously carried out if such effects can be eliminated by strengthening management. In this case, it is necessary to strengthen management in order to consolidate and improve the policies and measures. Some policies and measures are basically correct in orientation, but their side effects cannot be eliminated for a fairly long time because management cannot keep up with the situation. In this case, an appropriate readjustment should be made. The third situation is one in which

improper policies and measures should be corrected next year. No matter what reform is to be carried out, the general guideline is to combine the strengthening of centralization and unification with the activation of the economy and to bring into full play the initiative of localities, departments, enterprises and people under the guidance of state planning and the principle of taking the whole country into account.

3. It is necessary to work out as soon as possible an overall plan for reforming the economic system so that we shall have a long-term plan for reform.

III. On the Question of All-Round Consolidation and Readjustment of Enterprises

Efforts must be made to consolidate enterprises in order to achieve better economic results. Otherwise, there would be no foundation for all other work. The party Central Committee and the State Council have clearly defined the purpose and requirements of enterprise consolidation and have laid down explicit principles and policies in this regard. Now I will particularly discuss the following several points:

1. The first group of enterprises selected for consolidation this year should be big- and medium-sized key enterprises with more problems and a great potential and which urgently need to be consolidated. Many in this group should not be good enterprises; enterprises with more problems should be consolidated first. When these enterprises are consolidated well, their results will be raised quickly. Some enterprises that have a strong leading body and have done basic work well may carry out their consolidation by themselves or may be consolidated later. In this spirit, the lists of enterprises selected for consolidation in various localities should be adjusted.

2. Special attention should be paid to staffing enterprise leading bodies and reforming the leadership system. Judging from the streamlining of the State Council, the readjustment and strengthening of enterprise leading bodies can be carried out at a faster pace and they can become compact and efficient leading bodies. When the central administrative structure is streamlined, it will give a tremendous stimulus to enterprises in this regard. Enterprises have many qualified cadres and technicians in their thirties or forties who are well versed in their fields of work and who have both ability and political integrity. A number of them should be selected and promoted to positions in leading bodies so that great progress can be made in having leading bodies consist of revolutionary, well-educated, professionally competent and young cadres. In this way, it will be possible to bring about a noticeable change in this regard. To achieve this purpose, there should be an age limit in selecting and appointing managers and assistant managers of enterprises and directors and deputy directors of factories during the consolidation. Except for such exceptionally big enterprises as the Anshan Iron and Steel Company and such national corporations as the China Shipping Corporation, it is necessary to select as far as possible personnel below age 50 and no older than 55 for managers, assistant

managers, factory directors and deputy directors. Party committee secretaries and responsible persons of workers congresses may be a little older but not too old. Some comrades in enterprises who have not reached the retirement age and are still physically fit may go to the second line to serve as staff officers or advisers to do counseling work. Some comrades have suggested that personnel with an educational level equivalent to that of a college graduate and with practical experiences be selected for directors of big key enterprises. This is a good suggestion. If it is difficult for some enterprises to select personnel with the educational level equal to that of a college graduate for their directors, they should at least select persons who have the educational level of a polytechnical school graduate or those who have become qualified through self-study to be their directors. Only by properly staffing enterprise leading bodies during the consolidation will it be possible to bring about a big change in the outlook of the enterprises.

3. It is imperative to staff various units according to their fixed number of personnel and to train workers and staff members in rotation. After streamlining the administrative structure, a large number of cadres of central organs should be organized for study and training in rotation. This is a matter of strategic significance. During the enterprise consolidation, coupled with the institution of the economic responsibility system, it is necessary to be determined to get the surplus workers and staff members out for study and to persevere in doing so. Then, there will be a change in the educational level of all workers and staff members after a few years. If the surplus personnel should be allowed to remain in workshops and sections and on shifts, many malpractices will occur. This situation must be corrected. People in all localities should work hard in order to gain experiences in this regard.

4. We must strengthen leadership in a conscientious way. Party committees and governments at all levels must place the overall reorganizations of enterprises on their agenda and leading comrades themselves should take charge of this task. Economic commissions at all levels as well as all industrial and communications ministries, departments and bureaus must carry out this task in a practical way, and those teams assigned to work at selected units must carry out their assignments in earnest. The central authorities have decided that the organizational reform will not be initiated in provinces, municipalities and autonomous regions this year so that energies can be concentrated on enterprise reorganization and other tasks. All ministries under the State Council must assign someone to be especially in charge of this task and changes in the organs should not interfere with this task. All ministries concerned are requested to immediately hold meetings to study this task, work out plans and send out teams to work at selected units. The State Economic Commission is to be responsible for inspecting and supervising this task. We must carry out the task of reorganization in a down-to-earth manner for 2 or 3 years, promote all fundamental work at enterprises to meet the demands set by the central authorities, and greatly enhance their economic results so that there will emerge an entirely new look at the enterprises.

In connection with the enterprise reorganization, there is another problem, namely, readjustment of enterprises. Those industrial enterprises that turn out products not meeting social demands, that consume too much energy or that have long operated at a loss should be shut down, and have their operations suspended; they should be amalgamated or switched to the manufacture of other products and the practice of blindly setting up new industrial enterprises should be stopped. This is a positive measure taken to enhance the overall economic results of the society and to make the lineup of enterprises as well as the geographical distribution of industries become rational. Taking into consideration that enterprise reorganization has to be carried out as a major task, that cases of violations in economic fields have to be handled and that the reform of organs has to be promoted this year, we should be aware that a lot of work has to be done this year. In this connection, enterprise readjustment can be carried out only within a certain limit in 1982. Among those enterprises that have to be closed down or have their operations suspended first are metallurgical plants and chemical plants consuming much energy, machine-building plants and electronics plants turning out products of very poor quality, oil refineries achieving very poor economic results and some industrial enterprises run by communes or production brigades that contend with advanced enterprises for the supply of raw materials, fuel and power. Efforts should also be made to arrange their problems in order of importance and urgency, and to work out plans for enterprise readjustment as well as practical measures to deal with those enterprises that have to be closed down or have their operations suspended so as to be well prepared for promoting this task in a planned way next year.

At the same time, we must also pay attention to the promotion of major technological reforms at enterprises in a planned way. During the current period of economic readjustment, many machine-building plants are seriously in need of tasks to achieve while over 20 million dun of rolled steel is stocked in warehouses and the contingent of capital construction teams does not have much work to do while wages have to be paid and management expenditures have to be spent. On the other hand, plant facilities have become out of date and some of them have to be replaced with new ones. Can't we think of some way to "make a start" somewhere and activate work in various fields? We must consider the possibility of banks issuing loans to machine-building plants in the form of credit loans to sellers, of alloting rolled steel to these plants for the manufacture of new highly efficient equipment and of selling the equipment to those enterprises that need it to replace old equipment that is low in efficiency but high in energy consumption. It will not cost too much to carry out this task, for in promoting technological reforms, funds spent on equipment account for about 85 percent of the total investment under general circumstances. Some civil engineering projects have also to be completed. Since these projects will not need much funding, preparations for such projects can be made by either local units or enterprises themselves. Once this measure is taken, overstocked rolled steel will have an outlet, machine-building industry will be reactivated, the amount of waste iron and steel that can be supplied for remelting in furnaces will be increased, metallurgical industry will be given an impetus, tax revenues for the state will be increased and a new outlook will be brought about to the technology and equipment at various plants. This was tried out at the No 2 motor works with good results last year. We must make a start in technological reform and renewal of facilities this year. In promoting the technological reform centering on energy conservation, we must, first of all, reform technology in turning out several major products, including boilers, motor vehicles, transformers, water pumps and fanning machines [feng ji 7364 2623] as well as a number of basic parts for machines. We must do a good job in promoting technological reforms at such large enterprises as the Anshan Iron and Steel Company and the Nanjing Chemical Industrial Company, acquire some experience in this concern and then popularize their experiences.

IV. On the Question of Finance

The readjustment work was carried out conscientiously in 1981 by implementing the guidelines of the central work conference held in December 1980. As a result, the financial situation in 1981 was better than expected. Revenues totaled 102.8 percent of the annual plans. There was a deficit of less than 2.7 billion yuan, the figure mentioned in the report to the Fourth Session of the Fifth National People's Congress. However, we are still confronted with considerably great difficulties in finance. As stated in the 1982 state budgets, we anticipate the expenditures to exceed revenues by 3 billion yuan this year. Therefore, while noting the excellent situation we must also anticipate latent dangers in financial work this year. If we fail to achieve a balance between financial revenues and expenditures in the main, the deficit will increase and it will lead to issuance of more currency. This will affect not only the basic stability of commodity prices at markets but also the situation of stability and unity.

The general guideline for this year is to consolidate and stabilize the economic achievements and march forward steadily on this basis. Whatever happens, we cannot lower our guard after having initially stabilized the economy and thus aggravate the latent danger again. To this end, the Central Committee and the State Council have asked for efforts to further implement the policy of readjustment, restructuring, reorganization and upgrading and to continuously maintain a basic balance of revenues and expenditures and of credit receipts and payments together with a basic stability of commodity prices. This is not only an economic question but also a political one.

Fundamentally speaking, to resolve a financial question, it is necessary to develop production in earnest, improve economic results and do a good job in increasing revenues and cutting expenditures. Besides continuously and energetically developing the production of consumer goods as planned, changing the service orientation of heavy industry and conscientiously reorganizing enterprises, efforts should be made to grasp the following well:

1. The purchase price of agricultural and sideline products should be stabilized. The financial burden has become very heavy as more money is put into circulation and many different kinds of subsidies are offered. In 1981 the state gave subsidies of 32 billion yuan for more than 30 kinds of

commodities, of which over 80 percent had something to do with the prices of agricultural and sideline products. Although agricultural and sideline product prices have increased very little in the past 2 years, the proportion of increased and negotiated prices is growing bigger and bigger and the actual purchase price for agricultural and sideline products is still rising steadily. Generally speaking, to solve this question we must have a stable policy and readjust measures that exceed the limit of policy and those that are drastically irrational. We must refer to the method used by Zhejiang and other places of fixing the basic figures for planned purchase and apportioned purchase of agricultural and sideline products by the state; places that had abandoned this method should restore it. By now, 3 years have passed for some new producing areas; next year they should think about fixing a rational purchasing task or the purchase proportion. The increased and negotiated prices for purchase exceeding the planned quota should also be readjusted and controlled.

2. The granting of bonuses should be controlled. In general they should be stabilized at last year's level within the scope of provinces, municipalities and autonomous regions this year with emphasis on doing away with egalitarianism in bonus-granting and on distribution according to work so as to make the bonuses work effectively. Indiscriminate granting of bonuses should be firmly corrected.

3. Efforts should be made to tighten financial discipline, intensify supervision and inspection and plug loopholes. At present, many enterprises have indiscriminately assigned production cost, evaded tax and rationed profits which ought to be delivered to the state. All this has reached a fairly serious degree. We must pay attention to this and solve it. The financial inspection carried out early this year which achieved good results should be continued. Problems once discovered should be dealt with expeditiously; we should not turn big problems into small ones and small problems into no problem at all.

4. Investment in capital construction must be controlled. While there is no possible major breakthrough in capital construction, an expenditure item under plan, the amount of funds raised on one's own, the funds the enterprises themselves have and the fixed capital investments made with bank loans have grown into a considerably large sum. There are many problems in this also. Various provinces, municipalities and autonomous regions should check on them. For those projects that should go on, we should study how to put the funds to good use. Another problem is that some places have set up their own investment trust companies taking away bank deposits to do construction. To summarize, the amount of money available is limited and establishing an investment trust company here would mean reducing bank deposits there. This in fact amounts to diverting a part of the credit originally being used as current capital to capital construction, thus extending the capital construction line and hampering the improvement of economic results. I now reiterate that with the exception of those investment trust companies approved by the State Council or designated departments concerned, all other investment trust companies should be turned over to the banks. The job of raising and using funds should be handled exclusively by the banks and should not be done independently without them.

In short, our entire economic situation has come out of the "bottom of the pot," but the latent danger has not yet been basically eliminated. We rather assess the problem more seriously; we should never lower our guard or become unrealistically optimistic.

V. On the Question of Intensifying Ideopolitical Work

Under the new situation, ideopolitical work should not be weakened but intensified. Over the years, our political organs have been busy launching mass movements but they still lack an integrated set of experiences in doing ideopolitical work well in the economic sphere. We should make an effort to study and summarize experience in this area. Ideopolitical work should be based on the demands of the four modernizations and integrated with economic work and with the state of the mind of workers and staff in order to have a definite object in view to truly solve problems. In discussing how to intensify ideopolitical work, this conference has introduced the Daqing oilfield's experience of strengthening the building of contingents of workers and staff and the experience of the Tianjin caustic soda plant in carrying out education on the love of the party, the motherland and socialism through studying history and Chinese modern history. All this is more vivid, more realistic and convincing. We must, through meticulous and careful ideopolitical work, make the fundamental guiding principles of taking equal consideration of the interests of the state, the collectives and individuals and of "first, the people must have sufficient food; second, socialist construction must be carried out," take root in the minds of workers and staff and in work implementation as well.

Since the 3d Plenary Session of the 11th CCP Central Committee, the party and government have made maximum efforts in improving the people's livelihood in the rural areas and cities and the great majority of the masses are satisfied. The state of mind of the people in the cities at present is stable and upward looking on the whole. It should also be noted that a small number of people in the cities are still not too satisfied and are grumbling. Among them there are also elements with ulterior motives who desire to stir up trouble. It seems that there is a necessity for choosing a suitable time this year to universally carry out a vivid education on the economic situation. We should, through this education, reckon an overall account with the urban people and let the broad masses understand under what conditions the state solved the question of the people's livelihood since the downfall of the "gang of four," especially in the past several years since the third plenary session. The account would cover the increase in commodity prices, people's income, state subsidies to the urban people, employment, in the total amount of wages and bonuses, in housing for workers and staff, in the sale of durable consumer goods, and in urban savings deposits. All accounts should be brought into the open. The country has an account book. In the 3 years from 1979 to 1981, jobs were found for 26 million jobless young people who returned to the cities and towns; housing covering 220 million square meters in floorspace was newly completed for workers, staff and the people in the cities. The state increased subsidies of the selling price of agricultural and sideline products annually to more than 20 billion yuan. The total amount of wages for workers and staff in 1981 was 25.1 billion yuan greater than in 1978 or an increase of 44 percent; the average annual wages of workers and staff increased from 614 yuan in 1978 to 772 yuan in 1981 or an increase of 25.7 percent and so forth. Every city, every enterprise and every unit has such an account book and we should speak up with facts and figures. We must also make clear the existing problems in the spirit of seeking truth from facts. For example, for some party and government cadres, personnel engaged in scientific research, teachers and workers and staff of collective enterprises, their actual income has not been raised much and has even dropped. We should let the masses voice their opinion openly so as to help us carry out education about this situation and improve our work. Judging from results of education conducted in Shanghai, Liaoning and Xuzhou, in so doing, most of the people have come to know the truth and eliminate misunderstanding; they have realized that the party and the state have indeed made utmost efforts in the interests of the people. By reckoning accounts, workers and staff of the Shanghai No 2 weaving plant who used to grumble about their livelihood problems have become even-tempered and good-humored and vigorous in work. A party branch secretary of the Ningbo municipal clothing embroidery factory made some most profound and objective remarks. She said: According to the workers, over the past several years, they have found: 1) they have more money in their pockets; 2) commodity prices have also risen; 3) they still have more money in their pocket after carefully figuring out income and expenditures; 4) the young people have higher demands. The masses of workers are very reasonable. So long as we earnestly carry out education on the economic situation, a healthy atmosphere will prevail more promisingly and there will be no room for rumors and slanders.

We should, through education on the economic situation, further lead the people to fully understand our national conditions and to foster the idea of building our country through thrift and hard work and of arduous struggle. Ours is a developing socialist country with a huge population, a weak foundation and a very burdensome construction task in all fields. Livelihood improvement can only be materialized gradually with the development of production. It is therefore wrong and unachievable to put forth impractical and excessive demands. As to livelihood problems, we should not simply compare with the developed capitalist countries, nor should we compare with those oil-rich countries or certain countries and regions which have become prosperous by relying on processing. We have to go through a protracted hard struggle in order to build our great motherland into a more prosperous and strong country and to make all our people "comparatively well-off" for a more prosperous life later. This requires us to earnestly implement the principle of "first, the people must have sufficient food; second, socialist construction must be carried out." The people's livelihood needs to be improved gradually, but there is also a problem of doing things according to one's own capability. We still have to allocate some funds, goods and materials for construction and for continuously enlarging reproduction in order to advance toward the four modernizations. This is where the fundamental interests of the people of the whole country lie. A prosperous life will never become a reality if we only strive for enjoyment of life and divide up and eat up everything instead of carrying out construction. We must, through education, make the people correctly understand and handle well the relations between construction and livelihood and between accumulation and consumption and integrate the immediate with long-term interests.

We are deeply convinced that by striking at lawbreaking and criminal activities in the economic sphere and promoting the building of spiritual civilization together with education on the economic situation this year, the people's spirit will be greatly enhanced and the social mood will take a turn for the better.

BE A CLEAR-HEADED, STAUNCH AND PROMISING MARXIST

Beijing RED FLAG in Chinese No 7, 1 Apr 82 pp 11-14

[Article by Editorial Department]

[Text] We are going through a historical stage of great changes and development, from chaos to order and from poverty to abundance. The task of the party during this stage is to lead our 1 billion people to gradually build up the country into a modernized, highly democratic and highly civilized socialist power. Faced with this new situation and new task, party members and cadres, especially high- and middle-level leading cadres, must strive to become clear-headed, staunch and promising Marxists.

In order to be staunch and promising, one must first of all be clear-headed. As a Marxist, in order to be clear-headed, the most fundamental question is to have a farsighted and comprehensive view and accurate analysis and assessment of the present situation.

In the more than 5 years since the smashing of the "gang of four," especially since the 3d Plenary Session of the 11th CCP Central Committee, our party has reestablished the Marxist ideological, political and organizational line; formulated a series of principles and policies for socialist modernization that are suited to our country's national conditions; adopted many effective measures to improve the party's work style, enforce party discipline and restore the party's fine traditions; completed the task of bringing order out of chaos in guiding ideology; and made tremendous achievements in practical work. Our party and country have thus passed through the crisis caused by the decade of disorder of the "Great Cultural Revolution" and embarked again on the road to prosperity. This is the mainstream of the present situation and is a basic fact that no one can write off. If we take a wavering attitude or have doubts in this assessment of the present situation or if we take the nonessentials of the present situation for the essentials, we will commit grave mistakes. Does this mean, however, that other than war, there are no major dangers to our party, our country and our socialist cause and that we can sit back and relax? Of course not. Dangers exist even in time of peace.

Lawbreaking criminal activities in the economic field are now much more widespread than they were during the movements against the "three antis and the five antis" 30 years ago. Corrupted by capitalist ideas, some party members and cadres and even party organizations have degenerated. Of course, this phenomenon is only relatively more outstanding in a small number of localities and among a small number of cadres. It is only a countercurrent in the constant advancement of our party and country. If the whole party unifies its understanding and action and is united in waging an unremitting struggle, this countercurrent will certainly be overcome. However, if the whole party does not pay sufficient attention to this countercurrent and does not wage a resolute struggle against it, this countercurrent will undoubtedly exert a serious corrosive influence on the ranks of our party, undermine our social values and destroy the cause of socialist modernization. This clearly shows that other than war, there are dangers that will cause the decline of our party and country. We must have a clear-headed understanding of this important question which concerns the future and destiny of the party and country.

What do these dangers stem from? It goes without saying that we must maintain vigilance against the aggression and subversion of imperialists and social imperialists. Neither must we lower our guard against the activities of the remnants of the counterrevolutionary cliques headed by Lin Biao and Jiang Qing. But we should be even more aware that fortresses are most vulnerable to attacks from within. Our party is the vanguard of the working class. As long as the body of our party is healthy, maintains the purity of communism and is always linked with the people, no enemy forces will be able to defeat it. In this sense, the main danger lies within the party itself and in the possible moral degeneration of wavering members.

As to the party itself, the key is held by its high- and middle-level leaders, its principal leading cadres. In the article "The Role of the Chinese Communist Party in the National War" written in 1938, Comrade Mao Zedong said, "So far as shouldering the main responsibility of leadership is concerned, our party's fighting capacity will be much greater and our task of defeating Japanese imperialism will be more quickly accomplished if there are 100 or 200 comrades with a grasp of Marxism-Leninism which is systematic and not fragmentary, genuine and not hollow." This passage correctly and clearly states the position and role of leading cadres with a good grasp of Marxism in the revolutionary cause. In leading a population of 1 billion people toward socialist modernization, our party now needs 10,000 or 20,000 such Marxists instead of 100 or 200. If our leading cadres at high and middle levels are clear-headed Marxists, are staunch Marxists and are promising Marxists, the party will be built better and its fighting capacity will be greatly increased. Thus, our party will be able to correct all mistakes and overcome the phenomenon of corruption.

At present, we are faced with a fierce struggle between the corrosive influence of capitalist ideas and the resistance of socialist ideas to this influence. Viewed from what has already been exposed, a relatively serious tendency of bourgeois liberalization has emerged in many areas of China's social life. Decadent capitalist ideas and ways of life have exerted a rather serious corrosive influence on the ranks of the Communist Party and are rather seriously poisoning the general mood of society. Indeed, many party members and cadres have been roped in within a very short period. Some old cadres who were not conquered by the enemy's force of arms or the suppression of the Lin Biao and Jiang Qing counterrevolutionary cliques have been conquered by the bourgeois "sugar-coated bullets" in the past few years and have become captives of the bourgeoisie. That capitalist ideas have intruded into the militant Communist Party is a fact that brooks no neglect. Facts have clearly shown that bourgeois liberalization is not just a question of the cultural and ideological fronts but is a common question facing all fronts. On the economic front, phenomena such as smuggling, selling contraband, offering and accepting bribes, corruption, theft, speculation, swindling and appropriating large quantities of state property are not isolated or accidental occurrences. They are outstanding expressions of bourgeois liberalization under new historical conditions, that is, at a time when an open-door policy and a policy to enliven the domestic economy are being implemented. They are also an important manifestation of class struggle under socialist conditions. These facts have proved that under the new historical conditions, if we do not strengthen ideological and political work, do not establish and perfect corresponding management systems, do not adopt effective management measures and do not wage a struggle to resist the corrosive influence of capitalist ideas, we will not be able to smoothly carry out modernization. In the face of the serious corrosive influence of decadent capitalist ideas and ways of life, we must have the understanding that the present struggle against the corrosive influence of capitalist ideas and bourgeois liberalization, including the struggle to hit out at crimes in the economic field, is a protracted struggle that concerns the success or failure of China's socialist modernization and the prosperity or decline of the Communist Party and the country. The whole party must attach great importance to this struggle.

However, we must not forget historical experiences and lessons. Although the question of corrosive influence of capitalist ideas and bourgeois liberalization is rather outstanding at present, it is not after all the principal contradiction in our country. The principal contradiction in China is the contradiction between the people's growing material and cultural needs and the backward social production. This contradiction must be resolved by means of socialist modernization. The political line formulated at the 3d Plenary Session of the 11th CCP Central Committee is precisely to unite the people of all nationalities throughout the country to gradually build our country into a modernized, highly democratic and highly civilized socialist power. This is a Marxist line. It reflects the common desire and demand of the people of all nationalities throughout the country and represents the greatest interests of the masses of people. We must resolutely implement this line. The reason why we wage the struggle against the corrosive influence of capitalist ideas and bourgeois liberalization is also precisely to promote a fundamental change for the better of the party's work style, the people's practices and social order, to eliminate all interferences and obstacles in implementing the party's political line and to ensure smooth progress in our efforts to achieve socialist modernization. Therefore, if we want to be staunch Marxists, we must first firmly adhere to the line. We must not obscure the orientation of our advancement, must not shift the focus of our work and must not repeat the mistake of "taking class struggle as the key link." For over 20 years after the socialist transformation of the private ownership of the means of production had basically been completed, we did not shift the focus of our work to socialist construction. We thus regarded class struggle as the principal contradiction and committed the mistake of magnifying class struggle, causing the country and the people to suffer a lot. We should not do such foolish things again. In his report "The Present Situation and Tasks" given on 16 January 1980, Comrade Deng Xiaoping said: "Starting from the new year of the first year of the 1980's, we must not waste even one single day. We must concentrate all our attention on building the four modernizations." "Unless a large-scale war breaks out, we must be determined to persist on doing this. Everything should center round it and it should not be interfered in any way. Even if a large-scale war breaks out, we must continue to do it or begin our efforts again after the war is over. Our whole party and all the people must set this as the high aim and lofty aspiration. We must grasp it firmly, be more 'stubborn' and not be irresolute." We must always bear these words in mind.

Some people attribute the emergence of capitalist corruption and bourgeois liberalization to the party's open-door policy and the policy to enliven the domestic economy. This is totally wrong. We must make it explicit that such policies are firm and unshakable and introduced in accordance with the needs of our socialist modernization and with the international situation. It is of great strategic significance to implement such policies because our country is a big country which has a vast population, a poor foundation to start with and a relatively backward economy. In order to change this backward situation, we must make breakthroughs and learn the skills to manage the domestic economy and develop economic relations with foreign countries. We must devise a path of socialist construction which suits actual Chinese conditions and must never again take the old road which adopted a closed-door policy toward foreign nations and rigid management of the domestic economy. These correct policies of an open-door policy and policy to enliven the domestic policy will still be enforced even after our economy is developed. We should realize that there are numerous factors accounting for notable criminal activities in the economic field in some areas. For instance, there are still remnants of the ancient society and ideological influences of the exploiting class in our country; the pernicious influence of anarchism and extreme individualism which had been instigated by the Lin Biao and Jiang Qing counterrevolutionary cliques during the 10 years of disorder is far from being eliminated; while implementing the open-door policy and the policy to enliven the domestic economy, we have not been able to keep pace with the ideological and political work and with some necessary systems and measures of management, with the result that the influence of decadent capitalist ideas and the bourgeois way of life has multiplied, and so on. These are very important reasons. How can we attribute the rampancy of illegal and criminal activities in the economic field to the implementation of the open-door policy and the policy to enliven the domestic economy? Our party has drawn a clear demarcation line regarding these policies. The criminal activities in the economic field have nothing to do with these policies. In view of our party's principles, all these evil deeds have always been considered as illegal and are impermissible under party discipline and state law. All practices under the pretexts of being "special and flexible" which distort such policies and which are divorced from the socialist orientation, divorced from the communist stand and are contrary to party spirit and the party's principles, can only sabotage such policies. What we should do now is to sum up past experiences, carry forward the achievements obtained, overcome shortcomings and correctly and healthily implement the policies which have been formulated. We absolutely should not change the policies. Regarding this question, we must not waver in the least extent.

The revolutionary history of our country has shown that both the question of upholding the proletarian stand and maintaining the party's communist purity and the question of taking precautions against and opposing class capitulationism exist whenever we make contact with the bourgeoisie. Chen Duxiu's class capitulationism was manifested during the period of the great revolution. Wang Ming's class capitulationism was manifested in the early years of the war of resistance against Japan. In the early years since the founding of the country, it was perfectly correct and extremely necessary for us to cooperate with the national bourgeoisie. It also proved to be a complete success. However, some of our party members and cadres were hit by the "sugar-coated bullets" of the bourgeoisie despite Comrade Mao Zedong's warnings released on the eve of the liberation to the whole party against the attack of the bourgeoisie's "sugar-coated bullets." We are in a poorer situation at present compared to the situation then. Such circumstances are unavoidable in the new historical era. We must not lose our confidence in the party's policies because of the launching of the anticorruption struggle; similarly, we must not neglect, or slacken our efforts or be afraid to wholeheartedly launch the anticorruption struggle because we want to uphold and implement the party's policies. All our party members and cadres, and particularly the high- and middle-level party cadres, must have a firm proletarian stand, bear in mind the party's fundamental aim of wholeheartedly serving the people, bear in mind the party's ultimate goal of realizing the communist ideals, bear in mind the party members' vocation of maintaining the party's communist purity, and must always guide our actions with the communist ideological system during this struggle.

The present period we are in is a historical period of great significance, and also one in which there is plenty of scope for our talents. We should not be satisfied in being mediocre, decrepit and muddleheaded, but try our best to become useful and promising people. At present, the most important thing for us to do is to combine political steadfastness with scientific foresight, proceed from the higher plane of strategic ideology, shore ourselves us, be bold and resolute in our work, and try our best to create in the next few years a really new situation in various fields of our construction, including the development of our economic relations with foreign countries. In order to fulfill these targets, we must uphold the four basic principles, correctly carry out the line, guiding principles and policies of the party, go deep into the reality of life, strengthen investigations and studies, repeatedly study the new situations and solve new problems. We must master two skills: the skill of managing construction at home and that of developing our economic relations with foreign countries. We must carry out our work in two ways: developing the material civilization and improving the spiritual civilization, while correctly understanding and handling the relationship between the two civilizations. We must carry out reform and readjustment to eliminate the irrationality and shortcomings existing in the production relations and in the superstructure, resolutely carry out the streamlining of administrative organs and reform the cadre system with revolutionary spirit. We must regard opposition to the bourgeois liberalization tendency as an important part of party building and of consolidating political power for a certain period in the future, and attach importance to it. On the other hand, we must unswervingly carry on the struggle to seriously crack down on illegal and criminal activities in the economic field. We must fix our attention on and seriously and speedily handle those severely illegal and criminal activities, such as smuggling and selling contraband, bribery, corruption and theft, speculation and swindling, appropriating state and collective properties, and so on. We must punish those cadres who engage in serious crimes, especially those who are occupying important posts, and should never hesitate in taking actions against them, and not appease or shield them. With this struggle, we not only can resolutely stop unhealthy tendencies in the economic field, but also give the vast number of party members and cadres a profound Marxist education on party character, party work style and party discipline.

If we recall our party's militant course over the last 60-odd years, we can see that our proletarian revolutionaries of the old generation headed by Comrade Mao Zedong and others never failed to put forth to the whole party the task of strengthening studies whenever the revolution arrived at a turning point. Now, as the vast number of party members and cadres are to make themselves clear-headed, staunch and promising Marxists, they have to strengthen their studies in Marxism-Leninism-Mao Zedong Thought. Some articles written by Comrade Mao Zedong during the period of the anti-Japanese war, such as "The Situation and Tasks in the Anti-Japanese War After the Fall of Shanghai and Taiyuan," "Introducing the Communist," "Preface and Postscript to Rural Surveys," and so on are especially worth being reviewed. Although all of them were aimed at the concrete circumstances of the time, and our situation today is quite different from the historical conditions then, the basic standpoint, points of view and methods embodied in these articles remain very educational to us. All of our party members and party cadres, in particular leading cadres at middle and high levels, have to study anew and solidly master Comrade Mao Zedong's theory and tactics of the dual nature of the united front which promoted unification along with struggle. Under all circumstances we must resolutely safeguard our purity as communists, and we are not allowed to lower our ideological understanding and political consciousness as communists. All communists should never be corroded by the bourgeoisie. Under the new historical conditions, we must creatively apply this magnificent thought to developing our economic relations with foreign countries, to carrying out the policy of enlivening the domestic economy and all fields of social life, so as to overcome the tendency of bourgeois liberalization, to resolutely resist and oppose the corrosion of capitalist ideas. Thus, we will be able to stand invincibly and be unremitting in our advance toward winning new victories.

READJUST THE AGRICULTURAL SECTOR, IMPROVE ECONOMIC RESULTS

Beijing RED FLAG in Chinese No 7, 1 Apr 82 pp 15-19

[Special commentary by Bai Rubing [4101 1172 0393]]

[Text] How to accelerate the development of agricultural production, improve the commodity turnover rate and improve economic results is a problem of strategic importance which should be solved in readjusting the agricultural structure of Shandong Province. Here I would like to discuss some of our methods and theories for readjusting agricultural structure.

I. Rationally Readjust the Overall Crop Pattern Under the Guidance of State Planning

To readjust the agricultural structure, it is first necessary to satisfactorily handle the proportional relations between grain on the one hand and cotton and edible oil on the other hand. Since liberation, Shandong Province's agricultural production has developed considerably. Calculated in terms of 1970 prices, the total agricultural output value increased from 3.28 billion yuan in the early days after the founding of the PRC to 11.35 billion yuan in 1978, an increase of 2.5 times. However, owing to the "leftist" influence, the agricultural structure has been irrational and the economic results of agricultural production have been very poor over a long period of time. In the 22 years between 1956 and 1978, the average per capita income from distribution of the commune members throughout the province increased by only 16.5 yuan, an average annual increase of 0.75 yuan, of which the average per capita income from distribution of one-fourth of the basic accounting units was below 40 yuan. Particularly between 1959 and 1978, the four relatively poor prefectures of Heze, Liaocheng, Dezhou and Huimin consumed 11.07 billion jin of state marketing grain, spent 628 million yuan of relief funds and owed the state 517 million yuan in loans. Thus the problem of providing adequate food and clothing to commune members has remained unsolved for long years.

In the past, one of the important reasons for the poor economic results of our province's agriculture was that the ratio and distribution for grain and industrial crops, such as cotton and peanuts, were irrational. The climate and soil of Shandong Province are relatively suitable for the growth of multifarious crops. Historically it had a tradition of growing grain, cotton, peanuts, soybeans and flue-cured tobacco. While getting a good grip on grain production, vigorously developing such industrial crops as cotton and peanuts is not only the strong point of the province's agriculture but also the needs of the state and the people's livelihood. However, owing to the quite serious one-sidedness in the guiding ideology in our agricultural production, in agriculture, exclusive stress would be put on grain at the expense of industrial crops. Of the 40 million mu of farmland of the four prefectures in northwestern Shandong Province, 10 million mu of farmland is saline-alkali soil. The per mu yield of grain on such soil is 200 or 300 jin, the low yield being no more than 100 jin. If it is sown with cotton and things go well, every mu of such farmland will yield about 100 jin of ginned cotton and the income from it is largely equal to 300 percent of that from sowing grain crops. But, in the past, one-sided emphasis was put on the practice of "taking grain as the key link," the minimum acreage under cotton totaled only over 3.8 million mu, over 5.6 million mu less than the 1956 figure. In Jiaodong and central and southern Shandong Province there are several tens of millions of mu of sandy land which is suitable for growing peanuts. Previously, an area of 9 million mu of land was sown with peanuts. But later the minimum acreage under peanuts was reduced to over 3 million mu. As the result of the failure to bring the strong points into play, this subjective practice ended up with the production avenues becoming narrower and narrower.

Since the 3d Plenary Session of the 11th CCP Central Committee, we have implemented a series of the CCP Central Committee's principles and policies concerning agricultural matters. While enthusiastically introducing various forms of the production responsibility system, in the light of the province's actual conditions, we have readjusted overall crop pattern to ways suitable to local conditions and have achieved remarkable successes. Over the past 3 years, the average annual increase in the total agricultural output value of the province has been 7.3 percent; that in grain, 0.3 percent; that in cotton, 63.3 percent; that in peanuts, 13.9 percent; the yearly increase in the income from the diversified economy has been 22 percent; and that in the income of the commune members from collective distribution, 19 yuan. Thus the income in 1 year equals that of over 20 years. To develop industrial crops, we have adopted the following measures: 1) We have earnestly carried out the state's regulations concerning the readjustment of prices for the agricultural and sideline products and aroused the enthusiasm of the peasants for growing such industrial crops as cotton and peanuts. 2) In 1979, we began practicing "linking the purchase and marketing of grain with that of cotton," ensuring the grain ration for cotton growers, raising the standards for selling chemical fertilizers and grain as rewards to the cotton growers and encouraging the cotton-producing areas to grow more cotton. 3) In the concentrated cotton-producing areas, the principle of "ensuring cotton with grain and promoting grain with cotton" and that of "simultaneously grasping grain and cotton, with the stress on cotton" has been practiced. 4) We have summed up and spread, in real earnest, the typical experiences in effecting the double good harvest of grain and cotton and that of grain and edible oil and popularized such fine varieties as "Lumian No 1." 5) We have appropriately expanded the acreage under such industrial crops as cotton and peanuts, turned a considerable amount of saline-alkali land which is unsuitable for growing grain crops into land sown with cotton and turned portions of hilly areas into land sown with peanuts, and the greater part of the newly reclaimed "three wastelands" (sandy land, farmland running to weeds and alkaline land) have been sown with cotton and peanuts. Over the past 3 years, the acreage under such industrial crops as cotton and peanuts has been expanded by more than 7 million mu. The strong point of the northwestern areas of Shandong Province--cotton--and the strong points of the Liaodong peninsula and the central and southern areas of the province--peanuts, flue-cured tobacco and others have been brought into fuller play. The total output of cotton in 1981 was 13.5 million dan, 10.41 million dan more than the figure in 1978 or an increase of 337 percent and that of peanuts in 1981, 27.78 million dan, 9 million dan more than the 1978 figure or an increase of 47.9 percent. The ratio of the output value of industrial crops all over the province to the total output value of the planting industry increased from 15.7 percent in 1978 to 27.6 percent in last year. The commodity turnover rate of agricultural and sideline products has increased year after year. The commodity turnover rate for grain between 1978 and 1981 increased from 13.6 percent to 14.5 percent; that for cotton, from 87.4 percent to 95 percent; that for peanuts, from 57.3 percent to 60.2 percent; and that for flue-cured tobacco, from 95.7 percent to 97 percent. At present, the needs of the province for cotton, edible oil and tobacco have been ensured and, moreover, cotton, edible oil and tobacco can still be exported to earn funds to support state construction. In the fiscal year 1980, a net amount of 180 million jin of edible oil and of 960,000 dan of flue-cured tobacco was exported, an increase of 80 percent and 27 percent over that in 1978 respectively; and 1.36 million dan of cotton was imported from other provinces in fiscal year 1979, but in fiscal year 1980, 4.95 million dan of cotton was exported and in fiscal year 1981, 7.7 million dan was expected to be exported.

After the expansion of acreage under cotton and oil-bearing crops and the reduction in acreage under grain crops, will grain output fall? This is a question which quite a few comrades worry about. The results of practice show that grain output has increased rather than dropped. Grain, cotton and edible oil have promoted one another. Along with the development of industrial crops, the income of collective, communes and individual commune members has increased by a big margin, thus providing more funds for expanding reproduction and also large amounts for purchasing cottonseed-based fertilizer, peanuts and soybeans. This has played an important role in restoring and developing soil fertility and ensuring an increase in grain production. In the past, the four prefectures in northwestern Shandong Province concentrated on grain alone and, as a result, cotton production was not promoted and grain output was both low and unstable. Over the past few years, acreage under cotton has been expanded in line with specific local conditions and, as a result, cotton output has doubled and redoubled and grain output has also increased satisfactorily. Despite a reduction of nearly 2 million mu of farmland under grain in 1981, grain output registered an increase of 1.65 billion jin and cotton output registered an increase of more than 2.7 million dan over those in 1980. The masses say: "Particular attention has been paid to both gold (grain) and silver (cotton) and life has thus become increasingly more gratifying."

However, the acreage under industrial crops must not be expanded blindly. After the prices for agricultural and sideline products were raised, the peasants vied with one another in growing more industrial crops such as cotton and peanuts. Some concentrated grain-producing areas also reduced the farmland under grain crops and expanded the farmland for growing cotton, peanuts and tobacco and thus emerged the contradiction that industrial crops and grain are vying with each other in competing for farmland. In order to solve this problem, we have paid attention to the following things:
1) Priority must be given to planned economy in agricultural production. Full play must be given to the strong points of every province and locality on the one hand, and agricultural production must subject itself to state plans and the needs of the people's livelihood on the other. We must not indiscriminately grow whatever crops promise more income. Seen from the conditions of the province, the present acreage under industrial crops constitutes 25.63 percent of the total area of cultivated land. The proportions of the acreage under grain, cotton and oil-bearing crops are already largely rational. The acreage under industrial crops must not, in general, be expanded any more on a large scale. Shandong Province has a population of more than 73 million, and the area of farmland sown to grain crops must be kept at a level of over 70 million mu, averaging 1 mu of farmland sown to grain crops per capita. Before there is a breakthrough in agricultural science and technology, without maintaining so much farmland for growing grain crops, it will be difficult to be self-sufficient in grain. 2) Assuming full responsibility for grain purchase, marketing and allocation under a contract has been practiced. In order to ensure the decisionmaking power of the units at lower levels in planting and to enable them to uphold state planning and guidance, we have clearly pointed out that, under the premise of being self-sufficient in grain, the concentrated cotton-producing areas are allowed to go all out to develop cotton production; under the condition of ensuring the fulfillment of grain purchase tasks and ensuring the grain ration of the commune members, the concentrated grain-producing areas are allowed to appropriately develop industrial crops. Assuming full responsibility for grain purchase, marketing and allocation under contracts between the province and prefectures, between the prefectures and counties, and between the counties and communes and their subdivisions has been widely practiced. The contracts will not be changed once they are fixed. 3) It is necessary to reform the cropping system, make farming scientific and intensive, and constantly increase the yield of each unit area. Special stress should be put on doing a good job in intercropping and interplanting grain and cotton and grain and oil-bearing crops and improving the multicrop index. Last year, Wenshang County intercropped and interplanted wheat and cotton on 70,000 mu of farmland, resulting in an average per mu yield of 310 jin of wheat and 130 jin of ginned cotton. Calculated in terms of the acreage under practical cultivation, the per mu yield of wheat was equal to 1,033 jin, an increase of 470 jin compared with the output resulting from the method of single-cropping wheat; the per mu yield of ginned cotton was equal to 185 jin, 57 jin more than the output resulting from the method of single-cropping cotton. The potential for intercropping and interplanting grain, cotton and oil-bearing crops is enormous. In the future attention must be paid to promoting the intercropping and interplanting grain, cotton and oil-bearing crops.

II. Gradually Shift the Focus of Readjustment to the Overall Development of Agriculture, Forestry, Animal Husbandry, Sideline Occupations and Fishery

Grain, cotton and edible oil constitute an important part of agriculture but are far from the whole of agriculture. Only when agriculture, forestry, animal husbandry, sideline occupations and fishery are developed in an overall manner, can agricultural production be put on a foundation of ecological balance, and a benign cycle ensured and reliable conditions created for steady increases in grain, cotton and edible oil production. For a long period of time, we have not had a profound understanding of the dialectical relationships among agriculture, forestry, animal husbandry, sideline occupations and fishery, and more often than not regarded agriculture as the "principal occupation" and forestry, animal husbandry and fishery as "sideline occupations." This one-sided argument has bound us hand and foot and obstructed the development of forestry, animal husbandry and fishery.

Practice has given us an increasingly clear understanding of the fact that forestry and animal husbandry occupy an extremely important position and play a unique role in ensuring a benign cycle in agriculture. Afforestation can conserve headwaters as well as water and soil, prevent wind and fix sand, and regulate climate. Rainfall in areas covered with forest in the province is 15 to 20 percent more than that in areas without forest, and water retention in the former is 20 to 30 percent more than in the latter. After a forest net was established in 95 percent of the farmland of Yanzhou County, wind speed within the forest net was reduced on the average by 38 percent, air humidity increased by 6 percent and annual evaporation decreased by 375 mm. Developed animal husbandry can provide large quantities of organic fertilizers, ameliorate the soil, improve soil fertility, promote planting, and promote fulfillment of the target of "more livestock, more fertilizer and more grain." The high-quality barnyard manure provided annually by Rongcheng County's animal husbandry is equal to 100 million jin of compound chemical fertilizer. According to calculations, 36 percent of the nitrogen content, 56 percent of the phosphorus content and all the potassium content of the soil of this county at present are derived from applied barnyard manure.

Over the past years, we have consistently deepened our understanding of developing forestry, animal husbandry and fishery, adopted some measures and attained relatively satisfactory successes. However, last year's output value of forestry, animal husbandry and fishery amounted to only 14.4 percent of the total agricultural output value, of which the output value of forestry accounted for 1.1 percent; that of animal husbandry, 11.2 percent; and that of fishery, 2.1 percent. This shows that the province's structure of agriculture, forestry, animal husbandry and fishery is still quite irrational. This state of affairs requires that we further emancipate our minds, broaden our horizons, and effect an upswing in the production of forestry, animal husbandry and fishery as quickly as possible while paying close attention to the production of grain, cotton and edible oil.

Shandong Province has quite rich favorable natural conditions and enormous potential for developing forestry, animal husbandry and fishery. Apart from

110 million mu of cultivated land, the province has 56 million mu of barren hill land, beach wasteland and parcels of land scattered around villages, at both roadsides and along riverbanks, lands which are suitable for forestry and animal husbandry and are equal to half of the area of the existing cultivated land. The province has over 3,000 kilometers of coastline and more than 3 million mu of shallow sea and sandy soil which are available for breeding but only one-tenth of which has been utilized; it has over 4 million mu of freshwater composed of reservoirs, lakes, streams and ponds as well as river courses which are available for breeding and the greater part of which has not been utilized. The initial plans of the province in this respect is that a good foundation for the production of forestry is to be laid down within 3 years and all land suitable for forestry is to be planted with trees within 5 or 7 years, both in mountainous areas and hills as well as on plains. In the production of animal husbandry, while ensuring the steady increase in pigs, it is necessary to substantially develop plant-eating animals, such as cows, sheep, rabbits and geese. In the production of fishery, while appropriately controlling the gathering of fish and improving the quality of fish products, it is necessary to lay stress on seawater and freshwater breeding.

Judged from the conditions of the province, to speed up the development of forestry, animal husbandry and fishery, first, the leadership at various levels must raise their understanding, help the vast numbers of cadres and masses realize the important economic and social significance of grasping forestry, animal husbandry and fishery through various ways and means, put forestry, animal husbandry and fishery in the same important position as agriculture and grasp well forestry, animal husbandry and fishery as we have done with grain, cotton and edible oil. Second, the party's policies must be implemented. It is necessary to assign the barren hills, beach wasteland and all land suitable for planting trees to the production teams and peasant households under contracts as quickly as possible, and in addition assign part of the barren hills to the commune members for their sideline production. In animal husbandry, while upholding public livestock breeding, it is necessary to formulate and implement the relevant policies and vigorously encourage the peasant households to engage in livestock breeding. The main problem at present is that the level of pig breeding is decreasing. This has come about as a result of the fact that after the introduction of the production responsibility system, many communes and their subdivisions abolished some past effective regulations concerning pig breeding and, as a result, the enthusiasm of the masses was dampened. We are restoring, according to different specific conditions, the regulations concerning land for growing fodder, fodder rations, workpoints for collected manure, and the measure of 1 jin of pork for 1 jin of grain and so on, regulations which are aimed at encouraging commune members to breed more pigs. The units introducing the system of fixing output quotas for individual households and that of assigning land to each household in exchange for fixed levies are practicing the assigned purchase of pigs and have signed contracts related to this. Third, attention must be paid to the use of science. In paying close attention to the science and technology of forestry, special stress should be put on doing a good job in the breeding of fine varieties, the prevention and cure of plant diseases and the elimination of pests, and in the popularization of the already proven scientific and technological results. Take apples for example. The per mu yield of apples in the province is 1,000 jin, with the maximum per mu yield being 2,000 or 3,000 jin and the minimum per mu yield being 400 or 500 jin. With the spread of some common techniques for increasing production, the total apple output will increase from the present 2.4 billion jin to 3 billion jin. Fourth, it is imperative to grasp management. The key to grasping management lies in widely establishing and perfecting the production responsibility system in forestry, animal husbandry and fishery, doing a proper job of business accounting, and trying hard to reduce costs and improve economic results.

III. Take the Road of Comprehensive Operations Combining Agriculture, Industry and Commerce

To modernize agriculture and help the peasants to become prosperous as soon as possible, it is necessary to step out of the narrow scope of operation where efforts are concentrated on agriculture alone without paying attention to processing and commerce, to take the road of comprehensive operations combining agriculture, industry and commerce, and to improve the commodity turnover rate for agricultural and sideline products. Most of the raw materials of light industry in cities come from the countryside, which constitutes the main market for processed commodities. Therefore, doing a good job in locally processing agricultural and sideline products (including the semiprocessing of raw materials for light industry) will lessen the pressure on transportation and eliminate stockpiling, and economize on the time and expenses needed to transport materials and to help the peasants double and even triple their income by providing other ways than solely depending on the income from supplying raw materials. It must still be realized that the so-called rational agricultural economic structure must be an economic structure under which labor power is rationally distributed and time for labor is sparingly used. Shandong Province has a population of more than 73 million, of which 66 million are peasants. Along with the universal adoption of the production responsibility system and the constant improvement in agricultural mechanization, the surplus labor in the countryside will grow and grow. By developing commune- and brigade-run enterprises and carrying out a diversified economy in a big way, we will be able to fully utilize the labor resources of the countryside. This will not only provide more commodities and boost the income of peasants, but also be of far-reaching significance to the building of small cities and towns and to the lessening of the differences between city and countryside, between industry and agriculture. The labor power poured into industry, sideline occupations and the diversified economy last year by Yantai Prefecture constituted 54.8 percent of the total agricultural labor power; the income from industry, sideline occupations and the diversified economy made up 60.3 percent of the total agricultural revenue, and the average income of every commune member from collective distribution was 206 yuan. Looking at the province as a whole, the production brigades whose average per capita distribution is above 400 to 500 yuan are exclusively, apart from the solely fishing teams and cotton-growing teams, brigades whose industrial and sideline production and diversified economy constitute a considerably large proportion of their economy.

Shandong Province has quite rich resources for engaging in the processing of agricultural and sideline products, and the commune- and brigade-run enterprises have broad prospects. Last year the province produced over 13 million dan of cotton, of which a considerable part of the cottonseed could not be shelled and extracted into oil, and oil extraction alone produced an income of over 60 million yuan. The province has an annual yield of over 3 million tons of cotton firewood, those of which were used in processing totaled only 20,000 tons, comprising no more than 1 percent. The total output of fresh and dried fruit in the province is over 3 billion jin, of which the defective and substandard fruit which should be processed annually is about 400 million jin, but at present only about 4 million jin can be processed, accounting for 1 percent. The potential for processing straw articles and wickerworks is fairly large. The annual yield of corn husks which can be used for straw weaving is 300 million jin, of which only 100 million jin has been utilized; of the more than 57 million jin of wheat stalks, only over 10 million jin has been utilized; and of the more than 90 million of reeds, only 15 million jin has been utilized. Of the 4.7 million pieces of goat skins purchased by the province, only 290,000 pieces have been processed; of the purchased 170,000 pieces of cowhide, only 60,000 pieces have been processed; and of the 23 million pieces of other furs, only 5 million pieces have been processed. It can thus be seen that there are bright prospects for the vigorous development of the processing of agricultural and sideline products. If things are done well in this respect, it will bring about enormous economic results. For instance, processing sweet potatoes into starch will increase income from this produce by 80 percent and further processing of it into vermicilli will boost income from it by another 55 percent. The province has an annual yield of about 50 billion jin of sweet potatoes, and if 5 percent of this yield is processed into vermicilli, an additional more than 200 million yuan can be obtained.

To develop the processing industry of agricultural and sideline products, it is imperative to study and find solutions to the problems of relevant policies and structures, gradually bring the industry into line with state planning, and provide it with support and assistance in materials, funds and technical force. Besides first fulfilling the needs of the processing of state enterprises, the communes and their subdivisions should be organized in a big way to process those agricultural and sideline products which are suitable for local processing. Regarding some processing of agricultural and sideline products, the practice of establishing joint operations between the state on the one hand and the communes and their subdivisions on the other is encouraged. This practice will not only be conducive to finding a solution to the problem of being insufficient in processing capacity and to improving product quality and economic results, but also to resolving the contradiction of collective and state enterprises competing with each other for raw materials and tasks. It is necessary to provide reinforced planning and guidance and to make overall plans and rational arrangements for the processing orientation and processing quotas of a locality or a unit by taking all factors into account and to guard against blindness.

With the development of agricultural production, and particularly the development of industrial crops and a diversified economy, the existing commercial channels have more and more seriously failed to meet the needs of rural commodity circulation. At present, there exists the widespread phenomenon of "it is difficult to buy what we want to buy, and difficult to sell what we want to sell" in the rural areas. Some agricultural and sideline products are stockpiled in one place and are out of stock in another place. Not to reform the existing rural commercial structure will seriously interfere with agricultural production and the development of the entire agricultural economy. Apart from grasping well the experiment of the structural reform of supply and marketing cooperatives, to develop rural collective commerce, it is still necessary to develop brigade-run commerce in an active and orderly way, to turn the purchasing and marketing agencies of the supply and marketing cooperatives into collective commerce in which the brigade is taken as the basic accounting unit and assumes full responsibility for its own profits and losses, and to set up production and marketing service companies in charge of the commune's diversified economy and of organizing production, purchasing raw materials, promoting the sale of products, importing improved varieties from other places, directing and popularizing new technology and signing contracts on behalf of the collective and the commune members.

Readjusting the agricultural structure and improving economic results is an extensive and profound change in the rural economy. In the course of this change, we will constantly encounter some ideological obstacles, and some new conditions and new problems will crop up. This requires the party committees at various levels to provide more effective and practical leadership, to forcefully conduct ideological and political work, and to lead the peasants in persevering on the socialist road. Seen from the present situation, in carrying out ideological and political work in the rural areas, efforts should be concentrated on the following matters: It is necessary to correctly handle the relationship between the state, the collective and the individual, and earnestly give simultaneous consideration to the interests of the three parties and not concentrate on one aspect alone. It is necessary to correctly handle the relationship between state planning and guidance on the one hand and respecting the decisionmaking power of production teams and peasants on the other. Both the production teams and peasants must have "small freedoms" in planting, operation and handing over to the state or selling their products, and at the same time subject themselves to state planning and guidance. It is necessary to correctly handle the relationship between the multifarious sectors, forms and channels of rural commerce and the strengthening of market control and to enthusiastically carry out various activities of transportation and sale, so as to enliven the market on the one hand and to observe the state's policies and decrees, strictly forbid smuggling, speculation and profiteering as well as dishonest practices on the other. It is necessary to correctly handle the relationship between accumulation and consumption. Since their income has increased, apart from improving the conditions for their livelihood, the peasants are encouraged to boost accumulation which is to be used in expanding reproduction. We encourage hard work and frugality and oppose extravagance and waste. The key to doing a good job in ideological and political work in the rural areas lies in strengthening the building of the party basic organizations and political power. After the implementation of the production responsibility system, the party and government work in some units was weakened. This is a problem which warrants close attention and urgently requires solution. It is necessary to give full play to the role of the party branch as a fighting bastion and to the exemplary vanguard role of the communists, to strengthen the functionary role of the basic political power and to guard against separating oneself from collective affairs, and to overcome weakness and laxity in leadership. So long as the work of the party basic organizations and political power is strengthened and done successfully, the readjustment of the agricultural structure and the healthy progress of all rural work will be ensured of developing on a sound basis.

MR LI DINGMING AND THE IDEA OF BETTER TROOPS AND SIMPLER ADMINISTRATION

Beijing RED FLAG in Chinese No 7, 1 Apr 82 p 19

[Historical note by Huang Zheng [7806 1513]]

[Text] During the anti-Japanese war, our party launched a large-scale campaign for better troops and simpler administration throughout the liberated areas in accordance with the suggestion put forth by Mr Li Dingming, a patriotic personage in northern Shaanxi. In his article "Serve the People" of September 1944, Comrade Mao Zedong said: "The idea of 'better troops and simpler administration' was put forth by Mr Li Dingming, who is not a communist. He made a good suggestion which is of benefit to the people, and we have adopted it." ("Selected Works of Mao Zedong," Vol 3, p 954)

Li Dingming, born in Mizhi County, northern Shaanxi, in 1880, was a Hanlin Academy degree holder of the Qing dynasty and served as section chief in the government of Yulin Prefecture. He also had been a middle school teacher and a primary school principal in Yulin, Shaanxi Province. After that, he earned his living by practicing medicine and farming in his native place. After the establishment of the Shaanxi-Gansu-Ningxia revolutionary base area, he acted as the head of the Finance Committee of Mizhi County and was elected as the chairman of the county's Consultative Council in 1941. On 7 November 1941, he was elected vice chairman of the Consultative Council of the Shaanxi-Gansu-Ningxia Border Region at its second session. On 20 November of the same year, he was also elected vice chairman of the border regional government. Mr Li Dingming held the CCP in great regard. While working with CCP members, he made efforts to closely coordinate and cooperate with them. He also enjoyed high prestige in the border region.

It was at the beginning of November 1941, when he attended the second session of the Consultative Council of the Shaanxi-Gansu-Ningxia Border Region that Mr Li Dingming put forth his suggestion for better troops and simpler administration in order to improve the situation in the administrative organs of the border region that was not appropriate to the state of the war at that time. He said: "At a time when the people are undergoing hardships and the natural resources are in short supply, if we do not want to restrict military and administrative development owing to economic exhaustion, and if we do not want to harm our economic lifeline as a result of our military and administrative development, the government should make overall plans for the economy and apply the principle of better troops and simpler administration. It should keep its expenditures within the limits of income and draw up a budget so as to maintain a good balance." "Militarily, we should make our troops better and intensify their combat strength in line with the principle of every man being able to fight and help to win battles. We should avoid having the old and weak in the armed forces just to maintain a certain number. Meanwhile, the government should practice simple administration and streamline its organs. It should pursue a policy of limited staff with high efficiency and proficiency in order to avoid the existence of unwieldy organs with redundant staff and the waste of manpower and financial resources." On 18 November, the session passed Mr Li's proposal by a majority of 165 votes, and it was to be "submitted to the government for immediate action." In its declaration, the session formally proclaimed that "the government must practice simple administration and streamline its organs." In accordance with the opinion of the Consultative Council of the Border Region, the government made a decision to act accordingly and at the first government administrative meeting, it set up a special committee for this purpose.

Comrade Mao Zedong attached great importance to the suggestion made by Mr Li Dingming. He underlined in red the essential paragraphs and jotted them in his notebook with this comment: "This is a good method, which serves as an effective cure for our red tape, bureaucratism and formalism." At the beginning of December 1941, the CCP Central Committee decided to popularize this method adopted in the Shaanxi-Gansu-Ningxia Border Region. It issued the instruction for "better troops and simpler administration" to all anti-Japanese base areas, calling for overhauling organizations at all levels, streamlining organs, strengthening grassroots units, enhancing efficiency and practicing economy in manpower and materials. Following that, the CCP Central Committee issued some further instructions and decisions on the issue of making troops better and simplifying administration. Yanan's JIEFANG RIBAO repeatedly published editorials and sponsored discussion meetings on this subject.

When he was vice chairman of the border regional government, Mr Li Dingming earnestly carried out all the instructions issued by the CCP Central Committee. At that time, he was already over 60, and though in poor health, he was still very resolute in his work. In his inaugural address, Mr Li Dingming said in all sincerity: "After having read and studied some different books about socialism, I have come to understand that socialism is the only doctrine which is absolutely fair. In the world today, all countries are bound to follow the road of socialism. Now, China is besieged by a formidable enemy and is short of natural resources. There are numerous difficulties in pursuing socialism. Nevertheless, at this juncture of life and death, we must endeavor to carry forward socialism." Through three streamlinings, the Shaanxi-Gansu-Ningxia Border Region achieved great successes in its work. In his report "Summary of Streamlining the Border Regional Government" at the fourth meeting of the border regional government on 7 January 1944, Mr Li Dingming pointed out: "The border regional government has merged and reduced its internal offices by one-fourth. The organs directly under the government have been reduced from 35 to 22. The number of their staff has been cut down from 469 to 279. The counties in the border region have also been greatly restructured. We have attained our goals in five aspects--streamlining, unifying, promoting efficiency, practicing economy and combating bureaucratism."

The streamlining carried out in the Shaanxi-Gansu-Ningxia Border Region and other anti-Japanese base areas played an important role in overcoming the severe economic difficulties at that time, continuing the protracted war and winning final victory in the anti-Japanese war. We should never forget the important contribution made by Mr Li Dingming in this respect.

IT IS IMPERATIVE TO UPHOLD THE BASIC PRINCIPLES OF MARX' THEORY OF REPRODUCTION--PART THREE

Beijing RED FLAG in Chinese No 7, 1 Apr 82 pp 20-25

[Article by Deng Liqun [6772 0550 5028]]

[Text] III. Giving Priority to the Growth of the Production of the Means of Production Is the General Law of Expanded Reproduction

As we mentioned before, during the period of readjustment, it is inevitable for heavy industry to grow a little bit slowly or even not to grow temporarily. But can we conclude that the growth rate of heavy industry should always be lower than the growth rate of light industry and the proportion of heavy industry output value should always be smaller than that of the light industry output value? Should we take this as a policy to be adopted in our long-term planning? Some comrades hold this view. I deem that this view is inadmissible and we will make big mistakes if we accept this view. The comrades holding this view do not distinguish provisional measures from long-term policies and do not understand that, generally speaking, during the period of readjusting the economy, heavy industry should develop a little bit slowly while the production of light industrial products in short supply should grow faster, for it will be impossible to implement the policy of readjustment if we do not do our best to look after the industrial departments producing products in short supply, especially when energy supplies are limited. Yet while elaborating long-term plans, we still must uphold the principle of giving priority to the growth of the production of the means of production. Giving up this principle will result in the prolonged backwardness of heavy industry, stagnation of our light industry, agriculture and even of heavy industry itself (especially transportation and the energy industry) because of a lack of an increasingly perfected technology and equipment, and because of the permanent strain on our raw material and energy supplies, and thus give rise to very great adverse effects on the development of the national economy. Therefore, although we are temporarily reducing the proportion of heavy industry, we should not regard this as a long-term policy. In the long run, it is still necessary to increase the proportion of heavy industry gradually and appropriately. Even during the period of readjustment, energy and transportation are still regarded as key sectors when we arrange capital construction. This is indispensable for ensuring smooth expanded reproduction. This is all the more so in the process of industrialization, during which machines are to replace manual labor in production.

Not long ago, some comrades from theoretical circles put forward the formal proposition that we should build our society into an industrialized society with a light industrial structure. We adopted this proposal while drafting a document in April 1979 pursuant to the Central Committee's instructions. The document has not been completed and this proposal has consequently been given up. We might enquire into this proposal while conducting research. But taking this as a policy to be implemented deserves much debate. We want to substantially develop the production of consumer goods for daily use, and especially the production of consumer durables, so as to increase the supplies of these products continuously. But if there is insufficient energy, no new types of materials, and no modern technology and equipment, it will be impossible to produce consumer goods in such a way that the growing demands of the broad masses, both quantitatively and qualitatively, can be met. It is impossible to carry out modern construction without giving priority to the growth of the production of the means of production. There is no doubt that we must grasp light industry. We have not done enough in this regard and we still have to make great efforts to boost light industry. But we ought to be more far-sighted. That is the very reason why we should study economic principles and far-reaching policies. We still must uphold the principle of giving priority to the growth of the production of the means of production. In other words, the growth of heavy industry still must take priority. In the past, Comrade Mao Zedong always said that heavy industry should be the center of our economic construction, and he did not deny this even when talking about arranging the national economy according to the order of agriculture, light industry and heavy industry. Here the point is to have a clear idea of the direction in which heavy industry should render its services. In 1979, pointing to the metallurgical departments' blindness in respect to both output and quality, Comrade Chen Yun proposed that the metallurgical industry change its service orientation. He cited housing in the countryside as an example. Peasants were having difficulty in erecting houses for lack of timber in the countryside. The metallurgical departments could have produced some metal parts and supplied them to the countryside. This applies not only to the metallurgical departments, but also to all other heavy industry departments, which should orientate their services correctly, always bear in mind the needs of developing agriculture and light industry and the needs of the people's livelihood, and serve agriculture, light industry, the market and the people's livelihood. At the same time, they should bear in mind the needs of national defense. In addition, they should heed the demand of the international market so as to increase exports and help develop the domestic economy. In the past, we exported more semifinished products, such as tungsten ore, than finished products and even had to import many finished products, such as tungsten filaments, and thus suffered great losses. Heavy industry now has the task of readjusting its service orientation and should consider what to do in the light of the needs of agriculture, light industry, the market, the people's livelihood and exports. Meanwhile, the internal structure, or the internal proportionate relations of heavy industry, should be streamlined so that heavy industry can adapt itself to the readjustment of its service orientation. In the past 30 years, we have laid down quite a sizable foundation for construction, building up fixed industrial assets amounting to over 410 billion yuan and erecting over 400,000 industrial and communications enterprises. Now a very urgent and important task is to carry out, step by step, technological transformation on the foundation of modernization that we have built.

If we fail to carry out gradual technological transformation, the equipment in these enterprises will become more backward in a few years, and still less will they be modernized. If heavy industry's service orientation is correct, and plans and restructuring are carried out according to this orientation, there will be ample scope for it to play its role, its output value can be raised, its proportion can be increased, and its position and role in the national economy will become more important.

We propose that now, and for quite a long period in the future, on the industrial side, the development of the production of the means of consumption should occupy an important place. We should first ensure fulfilling the needs of developing industries producing consumer goods whether in respect to energy and material supplies, investment and allocation of credits, arrangement for the use of scientific and technological forces, and selection of research topics, or in respect to the introduction of technology and equipment from abroad. Does this contradict the principle of giving priority to the growth of the production of the means of production? There is no contradiction as long as the departments producing the means of production follow the correct service orientation, because the production of consumer goods cannot develop without the supplies of the means of production, or to put it the other way around, only if the production of the means of production grows first, will it be possible to meet, promptly and sufficiently, the needs of the departments producing the means of consumption in respect to machinery, equipment and newly discovered industrial raw materials.

Some comrades refute the principle of giving priority to the growth of the means of production from the viewpoint of policy while some refute it from the viewpoint of theory. The arguments of the latter are, in summary: According to one argument, this principle is theoretically unsound; according to another argument, it plays its role only under certain historical conditions and is therefore not a universal law.

Why is this principle theoretically unsound? The following arguments deserve to be brought up for discussion.

First, giving priority to the growth of the means of production is not Marx' viewpoint and Marx' opinion. Giving priority to the growth of the means of production is not the condition for expanded reproduction in the capitalist society. What are the facts? Marx in fact did not make such a generalization. It is Lenin who did so. But Lenin entirely followed Marx' theory when making this generalization. While interpreting Marx' theory concerning the condition for realizing expanded reproduction, Lenin included technological progress in the formula, made a detailed analysis bv means of charts, and then concluded: "Thus, we have seen that the production of the means of production which manufacture the means of production grows fastest, then follows the production of the means of production manufacturing the means of consumption, the production of the means of consumption grows most slowly. Even without the study that Marx made in his 'Das Kapital,' volume two, it would be possible to come to the above conclusion by referring to the law according to which constant capital tends to grow faster than variable capital, because the statement that the means of production grow fastest is merely another way of saying that this law applies to the total social product." ("Collected Works of Lenin," Vol 1, p 7) Under the capitalist system, technological progress and replacement of manual labor by machines find expression in a high growth rate of constant capital in comparison with variable capital. So whether Lenin is right in including technological progress (constant capital grows faster than variable capital) in his analysis depends on whether what "has been included" represents Marx' viewpoint. Whoever has read "Das Kapital," volume one, knows that in the chapter "The Process of Capital Accumulation," Marx demonstrated by detailed discussion that under the capitalist system, technological progress finds expression in the downward tendency of the ratio between variable capital and constant capital. As a matter of fact, Marx expressed this opinion on many occasions. For instance, in "The Theory of Surplus Value" he said: "With the development of capitalist production, the part of capital invested in machinery and raw material grows while the part of capital spent on wages decreases. This is an irrefutable fact." ("Collected Works of Marx and Engels," Vol 26, p 402) All this proves that the argument that Lenin's generalization is not Marx' viewpoint is without foundation.

Second, technological progress can also be achieved through economizing on means of production and, under this condition, technological progress will not find expression in the downward tendency of the ratio between variable capital and constant capital; according to the same argument, what has just been said is not covered by the analysis of Marx and Lenin. But, as a matter of fact, while analyzing the reproduction of capital in a society, Marx and Lenin never neglected to consider that more advanced and more perfect technology and equipment would replace backward ones. We know that while analyzing simple reproduction in "Das Kapital," volume two, chapter three, Marx expounded on how the two kinds of constant capital were replaced, including the replacement of value and physical replacement, which, besides, should correspond to one another; he also expounded on how additional constant capital was derived while analyzing expanded reproduction. As he said in the above-mentioned chapter, for replacement and addition alike "most of the means of production undergoes continuous renovation as a result of industrial progress. Therefore, instead of in the original form, replacement takes place in the form of renovation." ("Collected Works of Marx and Engels," Vol 24, pp 190-191) That is why he divided expanded reproduction into extrinsic expansion and intrinsic expansion. So-called intrinsic expansion means raising the efficiency of the means of production.

Of course, the point is not what Marx' and Lenin's views were, but whether their views are out of date.

It is true that since the middle of this century, especially since World War II, the developed capitalist countries have been increasingly resorting to economizing on the means of production for achieving technological progress. As a result, the capital component tends to decrease. For instance, in the United States, the ratios between capital and wages for the processing industries were: 4.12 in 1909, 3.26 in 1919, 3.67 in 1929, 3.51 in 1937, 2.49 in 1948, 2.36 in 1953 and 2.45 in 1968.

Does this mean Marx' principle that with technological progress, the ratio between variable capital and constant capital tends to decrease, and that, therefore, the argument that the growth of the means of production takes priority is no longer valid? We should admit that under the condition of achieving technological progress through economizing on the consumption of the means of production, this process, although not as evident as when manual labor was being replaced by machines, is still taking place. Let us make some simple analyses. What has constituted the economies of the means of production realized by the industries in the capitalist world in recent years? Lower consumption of raw materials and other material inputs, mainly owing to newly discovered raw materials and improvements in technology and equipment; lower expenditure on the so-called negative part of fixed assets, that is, buildings and projects. Here, many factors are effective only for a short period and will not be able to play a role forever. As regards the so-called positive part of fixed assets (or to cite Marx, "the skeleton system and muscle system of production"), the proportion of machinery and equipment has been increasing. Taking the major material production departments of the United States as an example, the ratios between their capital value and wages were: 1.06 in 1929, 1.1 in 1937, 1.12 in 1940, 1.07 in 1950, 1.27 in 1958 and 1.27 in 1968. While demonstrating that "in the process of capital accumulation accompanied by capital buildup, variable capital decreases relatively," Marx said: "With the lapse of time, one day old capital will be renewed from head to foot, will cast off its skin and will regenerate in the form of better technology, under which form, a smaller amount of labor will suffice for operating a larger quantity of machines and raw materials." ("Collected Works of Marx and Engels," Vol 23, p 689) Have the facts in the past decades refuted this thesis of Marx' or further corroborated it? Evidently, they have corroborated this thesis.

Third, the production relations in capitalist society are the condition for the law of giving priority to the growth of the means of production to operate, and this law ceases to exist under the socialist system. What should be our view of this argument? Of course, there is an acute contradiction between accumulation and consumption under the capitalist system, where constant capital grows faster than variable capital. In other words, more and more newly formed capital shifts into the production departments manufacturing the means of production, even to the extent that the two major categories become disproportionate. This has already become an objective law of economic development in capitalist society. But, just as Lenin pointed out, "Replacement by machines of manual labor is not 'absurd' at all, on the contrary, this reflects the role of all technological progress made by mankind." ("Collected Works of Lenin," Vol 1, p 88) In "Das Kapital," volume three, chapter two, which was rewritten by Engels according to Marx' manuscript, there is a passage which reads: "Labor productivity rises just because: the share of living labor decreases while the share of past labor increases; but since the total amount of labor embodied in commodities decreases, the decrease in living labor exceeds largely the increase in past labor." However, "as regards capital, the law of raising labor productivity does not operate unconditionally. As regards capital, this kind of productivity may be raised not when living labor can be saved in general, but only when the economy in paid living labor exceeds what is added to past labor." ("Collected Works of Marx and Engels," Vol 25, pp 290, 292) A very clearcut distinction has been made: the decrease in the share of living labor and the increase in the share of past labor, and the resulting decrease in the total amount of labor contained in products, is a universal law which operates in societies with any social and economic structure; the feature peculiar to capitalist society is that instead of seeking to economize on living labor in general, capital seeks to economize on the part used for remuneration of living labor. Just because of this, under the capitalist system, giving priority to the growth of the means of production is related to the phenomenon that the production of the means of consumption falls behind that of the means of production. But the production of the means of production cannot be separated too far and for a long period from the development of the production of the means of consumption. So when the production of the means of production has developed to a certain extent, there will be fluctuations and even crises, after which the lost equilibrium will be restored.

Production in a socialist society is, by nature, not for seeking profits but for meeting the needs of workers; it does not develop blindly but according to plan. We are absolutely in a position to ensure, by consciously observing the law of giving priority to the growth of the means of production, timely and sufficient supplies of the means of production to the two major categories so as to expand reproduction smoothly, and at the same time to ensure, by consciously observing the law of coordinated development of the two major categories, a correlative development of the production of the means of consumption and the production of the means of production while enhancing the development of the production of the means of production. Opposing the aim of production and the planned and proportionate development of production in socialist society to giving priority to the development of the production of the means of production, and asserting that giving priority to the development of the production of the means of production will cause the two major categories and even the entire national economy to become disproportionate and will make it impossible for production to meet the workers' needs in their material and cultural life, are views which do not have any foundation. For instance, under the capitalist system, a relative population surplus, or a huge contingent of jobless people, will inevitably appear in the course of capital accumulation, as the capital component increases. This is not only the inevitable consequence of, but also the condition for, production in a capitalist society. We also want to continuously replace backward equipment by more advanced equipment. That is why we must give priority to the growth of the production of the means of production and would otherwise be unable to realize modernization. But while determining the spheres and steps of the modernizations, we must give due consideration to the employment situation. In our country, which has a large population and an unfavorable starting point, employment is a great issue. Therefore, it is impossible to modernize our country quickly, and for a long period of time, manual labor and semimechanized production on the one hand and mechanized and automated production on the other hand will coexist. This is not only because it is impossible to accumulate so much capital overnight, but also because only in this way can more jobs be created. Since the 3d Plenary Session of the 11th CCP Central Committee, we have arranged jobs for over 26 million people while readjusting the national economy at the same time. Would capitalists have done the same thing? They definitely would not, for their method is to lay off as many people as possible. It is not only out of economic considerations but also out of political considerations that we have been doing so, because in this way we can in return secure social stability and unity, which are the indispensable conditions for building a modernized socialist country. In order to realize modernization as well as to arrange for employment, we must appropriately resolve the contradiction between the level of employment and the raising of labor productivity.

In the past, our national economy became disproportionate more than once. Since the 3d Plenary Session of the 11th CCP Central Committee, investigations and summarization of past experiences have been making it more and more clear to everyone that the policies guiding our economic work which were of the "leftist" ideological persuasion were the main causes. Policies of the "leftist" ideological persuasion included blindly pursuing high targets, biased interpretation of the giving of priority to the growth of the production of the means of production, and stressing the development of the steel and iron industry alone. As a result, the two major categories became disproportionate. Misinterpretation of the principle and the principle itself are two totally different matters, which should not be mixed up in our discussions. In the past, things went wrong in this regard, not because we upheld the principle of giving priority to the growth of the production of the means of production, but, on the contrary, because we acted against this principle, because correctly applying this principle requires us that we maintain a harmonious correlation between the two major categories.

Some comrades fail to make this distinction and ascribe the disproportion to the principle of giving priority to the growth of the production of the means of production, and even say that if this principle is alleged to be a law, then it can only be a law disrupting the overall equilibrium and a law disrupting the national economy. Other comrades even say that if we had started our industrialization from light industry, we would have accumulated much more capital and would have avoided the drastic ups and downs in our economic development. Thus, they have brought up an issue to be treated very seriously: Was the policy during our first 5-year plan ultimately right or wrong? As everybody knows, the industrial foundation in old China was very weak. Before the war of resistance against Japan, modern industry only represented slightly over 10 percent of the total industrial and agricultural output value, while heavy industry represented 23 percent of the total industrial output value. In 1949, steel output was only 158,000 tons, while most of the machine-building enterprises were small factories capable of carrying out repairs only. Under such circumstances, if economic construction had not been centered on heavy industry, it would have been impossible to equip light industry and agriculture with comparatively advanced technology so as to realize industrialization. Just because our party adopted the correct policy of taking heavy industry as the key sector, we were able to quickly establish our own modern machine-building industry, power equipment industry, metallurgical industry, mining equipment industry, high-alloy steel industry, important nonferrous metals industry and other burgeoning industries, and thus remarkably change the backward outlook of our industry as well as lay a solid foundation for further developing our national economy. During the first 5-year plan, while ensuring that the development of heavy industry remained the first priority, we also succeeded in developing light industry and agriculture. During these 5 years, the growth rate of the total industrial and agricultural output value averaged 10.9 percent per annum with the total heavy industry output value growing at an average rate of 25.4 percent per annum, the total agriculture output value growing at an average rate of 4.5 percent per annum and the total light industry output value growing at an average rate of 12.9 percent per annum. Facts have proved that the policy of giving priority to the development of the production of the means of production implemented during the first 5-year plan was correct. What we need to correct now is the misinterpretations of this policy, instead of the policy itself, which we can by no means give up.

Let us now discuss whether giving priority to the development of the production of the means of production is a law common to all forms of expanded reproduction, or a law which operates only under certain historical conditions.

First, as some comrades put it, let us have a look at "real economic life." Nobody denies that in the 19th century and in the first few decades of the 20th century, the production of the means of production took priority in capitalist industrial development, and only since the middle of the 20th century, especially in the decades after World War II, have the first category and the second category on the whole developed in parallel, with the growth rate of the second category exceeding that of the first category occasionally. This means that, as regards the development of capitalism, the latter situation has a shorter history than the former one, and that even the latter situation needs to be analyzed in detail. If we take the machine-building industry alone, which is the most important production department of the means of production, and compare it with light industry (the textile, garment, footwear, foodstuffs industries and so on), we see that the growth rate of the former has still been higher than that of the latter. From 1955 to 1974, the growth rate of industry in the developed capitalist countries averaged 5 percent per annum, with the growth rate of the machine-building industry averaging 5.6 percent per annum and that of light industry 3.8 percent per annum. The proportion of the machine-building industry in industry as a whole rose to 36.2 percent in 1974 from 31.3 percent in 1955, while that of light industry declined to 27.7 percent in 1974 from 31.5 percent in 1955. In the United States, from 1955 to 1977, the average growth rate of the total national product was 3.2 percent per annum, that of industry as a whole was 3.6 percent per annum while the average growth rate of the machine-building industry was 5 percent per annum, that of the electrical engineering and electronics industries 5.2 percent per annum, that of the precision machine-tool industry 6.7 percent per annum; the only exception was the industry manufacturing means of transportation, recording a lower-than-average annual growth rate, that is, 3.5 percent. In the case of Japan, between 1951 and 1974, the average growth rate of the national product was 9 percent per annum, that of industry as a whole was 13.7 percent per annum, while the average growth rate of the machine-building industry was as high as 19.1 percent per annum. In West Germany, England and France, the machine-building industry has also grown more or less faster than industry as a whole and than the national product. These figures show that we cannot simply deny that in the past few decades priority has been given to the growth of the means of production.

Of course, in addition to machinery and equipment, the machine-building industry also produces a part of the consumer goods for daily use. Yet, even taking into account this factor, the above judgment remains valid, because on the one hand the machine-building industry mainly produces machinery and equipment rather than consumer goods for daily use, and on the other hand, the textile industry, which falls under the category of light industry, also produces a part of the products used in production. Based on data published in the July 1981 issue of the American periodical "Manual of Basic Economic Statistics," some comrades have used the end-products on the market to calculate the growth rates of the industrial consumer goods and equipment in the United States from 1947 to 1980. The results are: the consumer goods increased by 341 percent while the equipment increased by 489 percent. These are very convincing data.

In the second place, even without making the above detailed analysis, there still remains the problem of how to grasp the relationship between economic laws and economic phenomena. While speaking of "the law of decreasing profitability," Marx said: "Some reactions will necessarily produce their effects to resist and counterbalance the effects of this general law, making it a law of tendency. Therefore, we call the decline in general profitability a downward tendency." ("Collected Works of Marx and Engels," Vol 25, p 258) While analyzing the general tendency of raising the agricultural component in the capitalist countries during the 19th century, Lenin also said: "We lay stress on the word 'general,' because both Marx and his disciples have always regarded this law as a law of general tendency in the capitalist world rather than a law operating under every particular circumstance." ("Collected Works of Lenin," Vol 4, p 93) No economic laws (in fact even no laws in general) exist in isolation without encountering the reactions of the factors which obstruct and resist their effects. Therefore, they can only be "laws of general tendency," and "real economic life" can by no means always correspond to economic laws without the slightest departure from them. Taking the law of giving priority to the production of the means of production as an example, in the past few decades, this law has encountered many factors obstructing and resisting its effects in the major capitalist countries. What we mentioned before while talking about the changes in the capital component was this factor. As a matter of fact, there are many other factors. For instance, depreciation of the means of production, increase in staff and workers' nominal wages, development of service industries and so forth. The development of service industries will boost the demand for consumer goods on the one hand and does not generate a great demand for the means of production on the other hand. This cannot but be reflected by the ratio between the growth rates of the two major categories.

It is particularly worth pointing out that since World War II, the growth rates of the production of minerals and fuels in the major capitalist countries have been noticeably lower than the growth rate of industry as a whole. Why could this situation exist? This is because these countries have become more dependent on imports for these products. According to statistics, the energy output of the United States in 1950, calculated on the basis of standard fuels, was 1,165,060,000 tons while the consumption amounted to 1,139,880,000 tons. Output exceeded consumption. But in 1958, consumption started exceeding the output, and in 1975 the consumption amounted to 2,349,550,000 tons while output was only 2,036,670,000 tons, the difference being 312,880,000 tons. In England, the standard fuels output in 1950 was 219.88 million tons while consumption amounted to 221.03 million tons. So the difference was not very big. But in 1975, the consumption rose to 295.33 million tons while output declined to 183.99 million tons, the difference being 111.34 million tons. The following data well illustrate the degrees of dependence on imported minerals and fuels on the part of the major capitalist countries.

The amount of products imported as a percentage of domestic supplies for some products in 1975:

	United States	England	France	West Germany	Japan (1976)
Crude oil	33.1	99.4	98.9	94.2	99.7
Coal		3.9	40.9	3.3	76.6
Iron ore	29.0	28.1	77.9	93.0	99.6

Raw materials and fuels account for a very large share of the means of production. If this part of the means of production is not produced inside the country, this cannot but be reflected in the growth rates of the means of production.

Economic life in a society is always related to political life. Therefore, in addition to economic factors, internal and external political factors also affect the effects of economic laws. This has to be taken into account while investigating how economic laws operate. We will not discuss this point here.

Factors counterbalancing the effects of the law of giving priority to the production of the means of production definitely exist in the socialist economy. For instance, although the socialist economy is basically an economy which develops according to plan and therefore does not have economic crises owing to overproduction as does the capitalist system, the production of the means of consumption and the production of the means of production will become seriously disproportionate for various reasons, especially because policies guiding economic work inappropriately and unilaterally emphasize the growth of the production of the means of production. Then, it will be necessary, as well as possible, to take the initiative in readjusting, suitably slowing the growth rates of the production of the means of production and substantially accelerating the development of the production of the means of consumption. Therefore, even under socialist conditions, it is impossible to permanently give priority to the production of the means of production.

Many people have enumerated and analyzed the factors which resist and obstruct the effects of the law of giving priority to the production of the means of production, yet have concluded that this law is not a universal law. This conclusion cannot be approved. We ought to pay attention to the "particular circumstance" arising from the obstruction of and resistance to the effects of economic laws. But this does not permit us to deny the existence of economic laws. If we adopt this method of analyzing problems, we may, I am afraid, deny any economic laws. (End)

ON GOAL, BASE AND SPEED

Beijing RED FLAG in Chinese No 7, 1 Apr 82 pp 26-27

[Article by Jin Wen [6855 3080]]

[Text] In reforming society and pushing it forward, the proletariat always maintains a clear goal. Our long-range goal is to realize communism. And our present goal is to build a modernized and powerful socialist country with high degree of democracy and civilization. In order to attain this goal, we have to start from the base of actual national strength. In the course of working toward this goal, we have to maintain a certain speed. Then, how should we decide on a really suitable speed? There are two methods. The first is to draw up a plan for capital construction based on a "high speed," which would be the product of subjective thinking; and the other is to draw a plan based on the present national strength.

From the statement "The scale of construction must conform with national strength" by Comrade Chen Yun, we see that he opposes the former and advocates the latter. He said: "The scale of construction must conform with the financial and material resources of the country. Whether it conforms with the latter is the criterion for judging whether the economy is stable. In a big country like ours with a population of 600 million, economic stability is extremely important. If the scale of construction is beyond the limits which financial and material resources can meet, then it is simply a rash advance and it will give rise to economic disorder; if the former and the latter are in balance, the economy will remain stable. Of course, it is no good to be so conservative that a reasonable speed of construction is not maintained." Initially, it would seem that it is not economic development but "economic stability," and it is not speed but "conformity," that was emphasized here. But actually this is not the case.

All people who support the socialist cause hope that our country's construction can be pushed forward more rapidly. Their hope is reasonable. The point is that development cannot emerge out of a void, and the speed must be subject to the limitations of the base. The reason is that the development of material productive forces is a continuous process. Marx pointed out in a letter to P. V. Annenkov: "Men are not free arbiters of their productive forces--which are the basis of all their history--for every productive force is an acquired force, the product of previous activity. The productive forces are, therefore, the result of practical human energy; but this energy is itself circumscribed by the conditions in which men find themselves, by the productive forces already acquired, by the social form which exists before they do, which they do not create, which is the product of the preceding generation. Because of the simple fact that every succeeding generation finds itself in possession of the productive forces acquired by the preceding generation, which serve as the raw materials for new production, a cohesiveness arises in human history, which is the basis of man's history." ("Selected Works of Marx and Engels," Vol 4, p 321) Similarly, in marching toward the goal of socialist modernization, we cannot do without a starting point, but the starting point is not up to us to choose. It can only be the existing base, the existing national strength, which mainly means the present productive forces. How and at what speed we approach our goal are not decided by people's will. Although a social movement is a process of material movement with the people's participation, and man's subjective initiative is by no means negligible, the social movement can never be freed from the limitation of national strength. The favorable factors embodied in national strength, at present or in the future, are helpful to us in raising the speed of development; meanwhile, the unfavorable factors will always affect it.

Economic development, being the growth of material force, must be handled with meticulous care. Only a solid, steady and substantial speed of development with good economic results will be good for our work of approaching the goal. And those "high speeds" with great fluctuations and bad economic results will be detrimental to both the country and the people. They can never speed up construction; in fact, they actually slow progress.

The lessons we have learned over the past years show that one-sidedly pursuing "high speed" and "high standard" and disregarding the compatibility between the construction scale and national strength will inevitably give rise to serious imbalances among various sectors of the national economy, production of substandard goods, tremendous waste of material resources, an upsurge of unhealthy tendencies in the economic field and an upsetting of the normal socialist economic order. In other words, they will bring about economic unstability or economic disorder. A country whose economy cannot be developed steadily will never be able to make remarkable and substantial progress although it puts both time and effort into this. Then what is meant by stable development? It means that every step is a substantial move forward. The speed, though not so "splendid" on an annual basis, will be marvelous in the long term. That is what we call striving for "stability" on the basis of "compatibility," and in turn, striving for development on the basis of "stability"; taking the whole situation into account and paying attention to real effect. Therefore, striving for stability can by no means be regarded as a rightist practice.

It is quite obvious that the idea of compatibility between the construction scale and national strength does not mean to oppose the demand for raising speed. On the contrary, it should not obstruct the achieving of a "reasonable speed." In his article "The Present Financial and Economic Situation and Certain Methods To Overcome Difficulties," Comrade Chen Yun said: "The basic idea of our work should be: striving for high speed while being well prepared for stagnation. We should try our best to achieve anything which is favorable to the increase of agricultural production. However, we must be aware that we will probably not reach the ideal speed although everything has been done. Therefore, we have to be well prepared for stagnation." Despite the difficulties caused by the "leftist" guiding ideology and rash actions at that time, Comrade Chen Yun remained in favor of maintaining a certain speed. "Striving for high speed" means to reach a relatively high speed; while being "well prepared for stagnation" means taking into consideration the minimum speed which we could reach with our "very best efforts." Here the "stagnation" owing to standing idle is intolerable, and it has nothing to do with that "stagnation" we mentioned in the idea of being "well prepared for stagnation." Similarly, although today we have suffered much from leftist rash practices in economic construction, we should never go to the other extreme and think that it is better to develop the economy as slow as possible.

Starting from and keeping compatible with the national strength is the material prerequisite for us in determining the speed of development. To do so is not a negative but positive act. However, there is emerging an idea in some places that gives no importance to speed in the present period of readjustment. Naturally such an idea leads to slackness and low efficiency. It is true that we started the economic readjustment in the beginning of the 1980's mainly because we had promoted the "high speed" and "high standards" in the past under the guidance of the "leftist" thinking which brought about a serious imbalance among various sectors of the national economy and severely undermined the national economy. Of course, the economic readjustment has to clear away the "leftist" guiding ideology, and lower the impractical "high speed" and "high standards" to a practical level in actual work. Therefore, some units have to be "closed, suspended, merged or shifted." What are all these measures for? They are intended to completely get rid of the "high speed" which caused great fluctuations and disregarded economic results in the past, and to replace it with a steady speed of development which will produce good economic results. Therefore, readjustment does not mean that we do not pay any more attention to the speed of development, but that we are to achieve an integration of speed and results, so that we can take a firm stand and advance in a better way on a more concrete basis. Thus, we will be able to turn the impractical "high speed" into a solid and substantial speed.

Such a speed can be reached and is bound to produce prominent results in the period of economic readjustment. This readjustment will on the one hand readjust the proportionate relationships between industry and agriculture, between light industry and heavy industry, and between accumulation and consumption; and on the other hand, readjust product structure, technical structure, enterprise structure and organization structure, and rationalize economic structure. If only we can conscientiously carry out these tasks the national economy will be able to maintain a certain growth in the readjustment which will bring substantially more benefits to the people. In the future, following the successful completion of economic readjustment and reform, our country's economic construction will surely achieve higher speed on the road of steady progress and healthy development. However, we should never forget the truth that "the scale of construction must conform with the national strength." Only by doing things in a practical and realistic way and making progress in solid steps can we reach real speed on the road toward achieving our goal.

WHAT IS CREDIT INFLATION, AND IS IT THE SAME AS CURRENCY INFLATION?

Beijing RED FLAG in Chinese No 7, 1 Apr 82 p 28

[Article by Chen Wenlin [7115 2429 2451] in "Questions and Answers" column]

[Text] Answer: Credit inflation refers to the volume of credit exceeding the sources of credit. In this case, the corresponding supply of goods and materials cannot keep pace with the growth of loans. The function of credit is to regulate social funds. In general, the volume of credits created by banks is based on the amount of deposits they have on hand. For example, if loans exceed sources and the state does not control marketable goods and materials, credit funds will be used to cover financial deficits or an excessive number of long-term construction loans will be made (these loans cannot supply marketable products in a short time), and then the phenomenon of the supply of money in circulation exceeding the supply of goods and materials will arise as a result of the new purchasing power derived from these loans. As a result, commodity prices rise and money is devaluated. Does this mean credit inflation will certainly arise whenever banks make loans in excess of the sources of these funds without a guarantee of goods and materials? I do not think so. In my opinion, only when the volume of credit expansion exceeds a certain limit does credit inflation occur. Last year, a basic balance was maintained between revenue and expenditure and between inflow and outflow of credit funds in our country. But there was not a complete balance, so the possibility of credit inflation still exists. We should never ignore this fact. In his government work report, Premier Zhao Ziyang said: "We should keep fund raising under control and prevent credit inflation. And the banks' role of accumulating, transferring and controlling credit funds must be strengthened."

Currency inflation refers to an excessive amount of paper money circulating in society--exceeding normal needs in commodity exchange and labor payment, and followed by devaluation. One of the inevitable results of inflation is a rise in commodity prices. But not all price rises occur because of inflation. China has incurred financial deficits for several years running. The supply of money has grown faster than the demand for money in circulation. An excess of banknotes exists in the market. Commodity prices have risen, but only by a small margin, because ours is a planned economy. 1) Purchasing prices of grain and other agricultural products are higher than their selling prices, and the difference is subsidized by the state. Thus, prices of people's daily necessities are basically stable and the stability of people's livelihood is guaranteed. 2) Generally, there have been no major price rises throughout the country, but have been some price increases and decreases. The extent of a price rise is limited by the state planning mechanism and administrative intervention. The workers' standard of living might be affected by a price rise. However, their standard of living is not only based on the level of prices but also on the level of their wages. In China, owing to adjustment of wages, issuance of bonuses, increase in employment and other factors in recent years, the growth of the per capita wage income of workers' families is higher than the growth of commodity prices.

Since 1979, we have raised the prices of agricultural and sideline products in a planned way. This was done in order to achieve price parity between industrial and agricultural products. It was not prompted by an excess of circulating money. These price adjustments are beneficial to rapidly recovering and developing agricultural production and to improving supply to urban residents and is of positive significance. Therefore, while observing and determining whether the amount of money circulating in market is reasonable, it is unadvisable to only examine the increase and decrease in the volume of money supply. This should be concretely analyzed by linking production with circulation.

Credit inflation is closely related to currency inflation. In Western capitalist countries, currency circulation includes two aspects--cash circulation and noncash settlements. There are no limits to the settlements of capital by account transfer or cash payments. So, credit inflation and currency inflation are, in fact, one and the same. Currency circulation in China only refers to cash circulation, and does not include noncash settlements. However, because money is put into circulation through credit procedures, the balance between the amount of cash put into or withdrawn from circulation depends on the balance between the inflow and outflow of credit funds. On a nationwide level, withdrawal of money from circulation means that the credit inflow volume is larger than the credit outflow volume; putting money into circulation means that the credit outflow volume is larger than the credit inflow volume. The balance of inflow and outflow of credit coincides with the balance of inflow and outflow of cash. In the past, owing to the interlocking of finance, credit and cash, capital construction pressed for finance and finance pressed for credits, so deficits in credit funds were covered by increasing the amount of currency issued. Under this system of fund management, if credit inflation occurs, currency inflation will certainly follow. But credit inflation and currency inflation are two different concepts. On the credit balance sheet, the volume of credits is equal to the volume of deposits plus the volume of currency issued. The increase and decrease in the volume of credits reflects the increase and decrease in the volume of deposits and the withdrawing and depositing of cash. Therefore, credit inflation might simultaneously take the forms of account transfers and cash payments, while currency inflation generally refers to an excessive increase in cash payments. In order to prevent credit inflation, the relationship between credit and currency should be properly handled, and the comprehensive balance of finance, credit, materials and foreign exchange should be maintained.

SEVERAL QUESTIONS WHICH CALL FOR ATTENTION IN LITERARY AND ART CREATION AT PRESENT

Beijing RED FLAG in Chinese No 7, 1 Apr 82 pp 29-31, 43

[Article by Wen Hua [5113 6895]]

[Text] Socialist literature and art must be improved and developed through a continuous process of practice and summing up of experience. In recent years, literary and artistic creation has flourished, bringing about a situation that has rarely been seen since the founding of the PRC. In the second half of last year, comrades in literature and art circles began to study and implement the spirit of the Central Committee's forum on questions on the ideological front, earnestly carrying out criticism and self-criticism in a comradely and realistic manner. In addition to affirming the achievements and mainstream of this development in literature and art, on the question of overcoming and preventing the mistaken tendencies of bourgeois liberalization, they reached a basically unanimous understanding, exchanged ideas and strengthened unity, creating conditions that are conducive to the further flourishing and healthy development of literature and art.

These studies and discussions have played an important role in the development of our country's socialist literature and art. One of the most outstanding results is the fact that we have had to draw a clear distinction between right and wrong on certain basic questions of literary and artistic creation.

1. A number of literature and art works describing social life during the "Great Cultural Revolution" have appeared since the smashing of the "gang of four." These works have played a positive role in understanding this internal disorder that brought serious calamity to the party, the state and the people of all nationalities and in understanding the essence of the Lin Biao and Jiang Qing counterrevolutionary cliques. However, an outstanding problem that exists in a few of these works is that they are unable to draw a clear distinction between, on the one hand, Lin Biao and the "gang of four," and on the other hand, the party, the state and the socialist system. As a result, objectively they have varying degrees of bad effects on the party, the people's regime, and the socialist system.

It should be noted that, although Lin Biao and the "gang of four" seized a considerable amount of the state's and party's power during the "Great Cultural Revolution" and invariably waved the banner of the party and socialism to justify their perverse acts, they were in fact a diseased growth on the body of the party and the socialist system. Lin Biao and the "gang of four," along with the serious calamity they brought on the people, were certainly not products of the party and the socialist system itself. On the contrary, they were the enemies of the party and socialist system of the working class. While they may have prevailed for a while, in the end they did not and could not escape the punishment of history. Once the victory against them had been achieved, it was inevitable that our party and socialist system should move rapidly into a new historical period. This is the true face of Chinese history during and after the "Great Cultural Revolution" and is also something that our party, and the people of all nationalities, including workers in literature and art, have come to understand through the summing up of the experiences of this historical period. As the "Resolution on Certain Questions in the History of Our Party Since the Founding of the PRC" pointed out, "Although we suffered from sabotage by the counterrevolutionary cliques during the 'Cultural Revolution,' we won out over them in the end. The party, the people's political power, the people's army and Chinese society on the whole remained unchanged in nature." These highly complex social and historical phenomena occurred under very special conditions and some authors have failed in their efforts at artistic condensation and judgment, believing that the "Great Cultural Revolution" represented 10 years of fascist dictatorship, during which time the state's political power was completely in the hands of the "gang of four." This mistaken understanding has meant that their works paint a very dark picture of the social reality during that time, giving no hint of either the reactionary nature of the Lin Biao and Jiang Qing counterrevolutionary cliques or the historical trend which was to result in their eventual downfall and offering no insight into either the struggle of the party and the people of all nationalities or the inevitability of their final victory. The inability to grasp the true nature of society in a correct and comprehensive manner has prevented a small number of authors and artists from correctly understanding and expressing the most profound and inherent truth of the age that "our people are a great people and that our party and socialist system have enormous vitality." It seems that a summing up of both the positive and negative experiences and lessons of literary and artistic creation and a deep study and appreciation of the "resolution's" scientific analysis of the "Great Cultural Revolution" will contribute significantly to the improvement of artistic and ideological standards in this type of creative activity.

2. Practice has proved that pursuit of special privileges and bureaucratism are, in the entire ranks of revolutionary cadres, only partial and temporary phenomena which can certainly be overcome by the forces of the party and the people's regime themselves. In observing life, selecting material, refining plots and portraying characters, writers and artists should take a stand that conforms to the basic interests of the party and the people. Moreover, through their own creative work they should be able to play a positive role in improving party work style and work and in promoting socialist modernization. However, an important point that needs to be put forward here is that

it is essential to clearly distinguish the fundamental differences between the old and new social systems and between the party's cadre force and the very small number of degenerates and speculators who have worked their way into it. The socialist system is incompatible with the phenomena of pursuit of special privileges and bureaucratism. Our cadres are certainly not bureaucrats of the old system; they are the people's servants and communists who devote their all to the cause of liberating the whole of mankind. Otherwise, there could be no new China in which the people are masters, and there could be no victory for socialism in China. It is absolutely essential to mercilessly expose the small number of degenerate elements and speculators. However, there is no basis at all for maliciously uglifying and launching unbridled attacks on good comrades who have shortcomings or going so far as to paint a dark picture of the entire party and cadre rank. There is a school of thought which believes that those within the party have come to form a "privileged class"; maintaining that only artists have a "conscience" and that politicians have no "conscience." No matter what an individual author's motives may be, any work which is written on the basis of such thinking will be basically contrary to historical facts. Our party and the people of all nationalities earnestly hope that writers and artists will be able to shift the focus of their creative activities toward the ongoing struggle, to build a new life. To say that this represents a ban or a disguised ban on any writing dealing with privilege and bureaucratism reflects a serious misunderstanding of the situation. There is still a dark side to our life and not a single day passes without the party and the people having to struggle against these dark aspects, including privilege and bureaucratism. The task put forward by the Central Committee of struggling against corruption is further proof of this. Two years ago, Comrade Hu Yaobang's "speech at the playwright forum" clearly pointed out that "our party has already resolved to solve the problems of bureaucratism and privilege and is currently adopting measures to this end. The party dearly hopes that comrades in literary and art circles will join us in adopting the correct policy, using literary and artistic creation to expose and overcome bureaucratism and privilege seeking." This is both the sacred right and the unshirkable responsibility of socialist artists and writers. Faced with the various problems for which the party and people show concern, our writers and artists must not close their eyes to any of the backward, negative and ugly phenomena that confront them. Rather than remaining silent, they should bring the indispensable critical functions of socialist literature and art into play in a real and effective manner. In fact, in all areas of artistic creation--novels, films, plays and poetry--there have been a considerable number of successful works which have had the correct ideological viewpoint, shown great artistic creativity and adopted the correct method in exposing and opposing all types of unhealthy trends, including privilege-seeking and bureaucratism. The party and the people have, of course, shown great interest in and welcomed these works.

3. Since the smashing of the "gang of four," we have sharply criticized all kinds of expressions of the personality cult in the literature and art field. Take the ideological stand of Marxism, for example. A number of writers and artists have used the form of literature and art to expose the complex, multifaceted political and historical causes of "overconcentration of party

power in the individual, and the growth of autocracy in the party and of personality cults," to help people to draw the necessary lessons. This is very significant. But of course, not all works which deal with this subject and theme have the correct stand, viewpoint and method, nor do they all express a rigorous creative attitude and a sense of revolutionary responsibility. Certain works take a one-sided and vulgar view of the problem and use insinuations and satire to describe the proletarian revolutionary leaders, especially Comrade Mao Zedong, as symbolizing "monarchical power" and "divine rights." This leads to distortions of history. "Comrade Mao Zedong was a great Marxist and a great proletarian revolutionary, strategist and theorist. It is true that he made gross mistakes during the 'Great Cultural Revolution.' But, if we judge his activities as a whole, his contributions to the Chinese revolution far outweigh his mistakes. His merits are primary and his errors secondary. He rendered indelible meritorious service in founding and building up our party and the Chinese people's Liberation Army, in achieving victory in the cause of liberation of the Chinese people, in founding the People's Republic of China and in advancing our socialist cause. He made major contributions to the liberation of the oppressed nations of the world and to the progress of mankind." Every writer and artist who seeks to express this solemn and important theme and subject should use the "resolution's" scientific and factual assessment of Comrade Mao Zedong's historical position as an ideological guide. Several writers have recently tried to sum up lessons and experience in this area in the light of their own creative practice. This has been of enlightening significance in the question of how our literary and artistic creation should solve the relationship between opposition to personality cults, on the one hand, and correct treatment of revolutionary leaders, on the other.

4. In the past there was a simple tendency among our creators of literature and art to completely ascribe a person's social nature to his class nature. This tendency has been criticized and has started to be corrected in practice. In recent years bringing order out of chaos on the theoretical level has led to the appearance of a group of successful works guided by the Marxist world outlook which express concretely the richness and complexity of human society. However, a number of works preaching abstract human nature have also appeared. This is mainly expressed in the following ways: 1) observing life and history from the viewpoint of abstract human nature and defining the struggle between the masses under the Communist Party's leadership and the "gang of four" as a struggle between human nature and antihuman or animal nature; 2) making vigorous efforts to seek beautiful human nature in class enemies or reactionaries, blurring the distinction between the enemy and ourselves and even making "human nature" and "human feeling" an excuse for defection to the enemy, treason and other treacherous acts; 3) preaching that abstract human nature is the lever of history and the motive force by which mankind can hold together and society can develop; 4) holding that the revolutionary war and land reform waged under party leadership and even the socialist system itself depress and ruin human nature; 5) in theoretical circles, confusing a person's nature with his natural properties and abilities. As a result of this, people have begun to believe that "writing about emotion means writing about love, and writing about love means writing about sex." Such a viewpoint and tendency has, in reality, only opened the way

for vulgar works advocating "sexual emancipation" and promising sensual excitement. There is an urgent need for further analysis, study and criticism of such a viewpoint and tendency.

5. Serving the masses and socialism is the fundamental orientation of our literature and art. The reason that literary and art creation has been able to achieve such outstanding results and to win the support and praise of the broad masses of the people in recent years is that, through the accurate portrayal of people's lives, this creation has expressed the thinking, the emotions, the aspirations and the demands of the people. Serving the people means regarding the people as an entity and as a decisive factor stimulating the advance of history, and means serving the people's fundamental interests and desires. Hence we certainly cannot separate serving the people from party leadership and the socialist system, nor can we set them against each other. However, certain literature and art workers claim to be the people's spokesmen on the one hand and adopt a posture of opposing "the politics of government" and "official politics" on the other. There are others who announce that they will stand on the side of the people whenever any conflict emerges between the party and the people. However, it can be said with certainty that any attempts to drive a wedge between the party and the people or any attempt by the so-called representatives of the people to deviate from the party and the socialist system will inevitably come to naught. We can also say with certainty that the people have no need for such representatives. The ideological sentiments expressed in the works of those writers who profess to "stand resolutely on the side of the people" are invariably those of individualism and anarchism. The people openly decided long ago whether such ideological sentiments are beneficial or damaging. There are also some writers who regard "box-office value" as the sole criterion for judging whether the masses are being served well or badly. In fact they are just catering to and satisfying vulgar and backward emotions and interests not yet overcome by a part of the masses. This is quite different from truly serving the people. Comrade Mao Zedong pointed out 40 years ago that, "undertakings which truly serve the masses of people are now certainly under the leadership of the proletariat." History has borne witness to the truthfulness of this judgment. Only those writers and artists who uphold the four basic principles will ever become true representatives of the people's interests and will ever be able to create good works that suit the basic interests of the broad masses of the people.

6. In literature and art creation, reflecting the essence of life should be the meaning of the task "writing about the truth." So-called artistic truth, however, does not refer to the simple copying of the phenomena of life, but to using living artistic images to expose the inherent connections and objective trends that exist in and between objects. In literature and art theory and practice, some people set "writing about truth" against "writing about the essence" and confuse "writing about the essence" with embellishing life and advocating "hiding the truth and deceiving people." This both violates the Marxist theory of cognition and also belittles and twists the truth of literature and art. Just as the affirmation of simple facts cannot be termed "truth," the naturalistic portrayal of the daily phenomena of life cannot be called "artistic truth." Artistic truth should be the reproduction

of the real essence of life. The most essential things, however, are always concealed by the superficial phenomena of daily life. Therefore, in order to achieve artistic truth one must explore and uncover the details and true meaning of life and condense them artistically. If one is incapable of seeing the "deep currents" of life and notices only the froth on the surface and the dress, and if one does no more than list life's phenomena, exaggerating catastrophic scenes and displaying only ugly phenomena, this will not only distort the true face of life, confuse people's understanding and create bad social effects but will eventually also bring into question the artistic content of the things described.

Our socialist literature and art are developing healthily. We firmly believe that so long as efforts are made to study, and regular attention is paid to guarding against and overcoming bourgeois liberalization and other unhealthy trends, our socialist literature and art will certainly be able to achieve even greater success. As a crude outline of several questions concerning creation, this article provides reference material for further discussion among comrades in literature and art circles. If there are places where the wording or analysis is either imperfect or simply erroneous, we sincerely hope that readers will offer their criticism.

A BRIEF DISCUSSION OF THE THEORY OF 'NATURAL RIGHTS'

Beijing RED FLAG in Chinese No 7, 1 Apr 82 pp 32-36

[Article by Gu Chunde [6253 2504 1795]]

[Text] Not long ago, the theory of "natural rights" established by the bourgeois thinkers became one of the most important "theoretical" bases of the bourgeois liberal trends prevailing in Chinese society. Therefore, it is absolutely necessary to conscientiously observe and study the theory of "natural rights," expound the historical process of its emergence, development and progressive role, and point out its hypocritical and limited nature and its class essence.

I

The theory of "natural rights" was a product of historical development. It sprouted during the Renaissance in Europe. The 14th and 15th centuries marked the darkest period of feudal and autocratic rule in Europe. The feudal production relations severely hampered the development of the capitalist economy, and the feudal lords and churches brutally exploited the broad masses of serfs. The feudal state rule and the shackles of the church were unprecedentedly strengthened and class contradictions became increasingly acute. Under the trammels of the feudal production relations and the heavy oppression of the feudal hierarchy and church privileges, the oppressed classes were not treated as human beings. In particular, the bourgeoisie, which had emerged, did not possess any human rights. Those who were the representatives of commodities and currency lacked the freedom of carrying out commodity exchange and circulation, those who amassed enormous wealth were not allowed to enjoy comforts, and the masters of science and technology were brutally ruined. Hence, humanity, human rights, freedom and the emancipation of individual character naturally became the basic demands of the bourgeoisie. A fierce struggle between the bourgeoisie, feudal class and churches occurred in the ideological field. The Renaissance in Europe, which started in the 14th century and reached a high tide in the 15th century, was a concentrated manifestation of this struggle. Some early bourgeois thinkers ruthlessly attacked and repudiated Roman Catholicism and its decadent feudal ideology comprising mainly scholasticism and theology. They began to express their views on the rights of individuals from the angles of the reason, dignity and happiness of man. The ideological "natural rights" had already murkily developed, although they were not explicit. They ushered in the dawn of capitalism.

The theory of "natural rights" was formally established and developed during the period of bourgeois enlightenment in the 17th and 18th centuries. Those who initiated the theory included Hugo Grotius of Holland, John Locke of England and Jean-Jacques Rousseau of France. Proceeding from the rationality of mankind, they put forth for the first time the idea that the rights of individual freedom, individual happiness, acquisition of property and self-defense were innate and inborn in mankind, which even God could not deny, to counter feudal autocracy, feudal hierarchy and the theological concept that "power is granted by God." Grotius said that mankind was entitled to "natural rights." According to his interpretation, the contents of such "natural rights" included "life, freedom and property." Rousseau stressed that "every human being is born free and equal." They maintained that feudal rulers violated and sabotaged these rights of man and that people had the right to overthrow the feudal rule. According to inferences and hypotheses made by bourgeois thinkers, the so-called "natural rights" were nothing but basic rights enjoyed by people as human beings, that is, the rights of man. Their main contents included the right of existence, the right of freedom, the right of equality, the right of property, the right of self-defense, the right of resistance, and so forth. These rights are natural, eternal, universal, untransferable and inalienable and would never change regardless of time, place, nationality, background or environment. They came into being prior to the establishment of the state and law, or even the existence of mankind. The state and law could neither fix nor change them. This was the initial meaning of the theory of "natural rights."

The theory of "natural rights" reflected the characteristics of the capitalist production relations and represented the interests and demands of the bourgeoisie. Therefore, once it arose, it was accepted and welcomed by the bourgeoisie and became the theoretical basis of the bourgeoisie for repudiating the old order of feudalism. In the 17th and 18th centuries, the bourgeois revolution erupted in England, America and France. "Natural rights" became the basic contents of the political program of the revolutions. The "Declaration of Independence" of the United States and the "Declaration of the Rights of Man and of the Citizen" of France, issued in 1776 and 1789 respectively, were permeated with the principle, spirit and contents of the theory of "natural rights." The "Declaration of Independence" explicitly says: "We hold these truths to be self-evident, that all men are created equal, that they are endowed by their 'creator' with certain inalienable rights, and that among these are life, liberty and the pursuit of happiness." The "Declaration of the Rights of Man and of the Citizen" explicitly proclaimed: "All men are born free and equal in rights," "The purpose of any political integration is to preserve the natural and unshakable rights of man. These are rights of liberty, property, safety and resistance to oppression." The "declaration" particularly emphasized: "Property is a sacred and inviolable right." After the victory of the French bourgeois revolution, a number of constitutions were drawn up. Each constitution continued to affirm the principle of "natural rights" and stated that the principle of the "Declaration of the Rights of Man and of the Citizen" should be "scrupulously observed." At present, the basic rights of man and citizens have been stipulated in the constitutions of a number of bourgeois countries in the world. Hence, "natural rights" not only originated from natural law, but were also recognized and affirmed by substantive law. At that time, the implications and contents of "natural rights" were more extensive than when they were first established, because they actually included various basic rights of the citizen.

It is obvious that the theory of "natural rights" has become not only an important content of the bourgeois democratic system, but also its theoretical basis and the dogma which the bourgeoisie believes. In spite of the fact that the specific implications and contents might change in this way or that, its bourgeois character will never change.

II

The theory of "natural rights" in opposition to theocracy and monarchical power did play a fairly great progressive role in opposing the rule of feudal autocracy. However, we should realize that although the theory of "natural rights" flaunted the banner of the interests of common people, it actually represented and reflected the rights and interests of the bourgeoisie. Marx pointed out sharply that "natural rights" were actually the privileges of the bourgeoisie because their nucleus was the right of property. In a capitalist society, such rights can only be monopolized by the owners of capital. Marx also profoundly stressed: "Equally exploiting labor force is the main human right of capital." ("Collected Works of Marx and Engels," Vol 23, p 324) He affirmed that the relations of exploitation between capitalists and laborers, safeguarding the bourgeois rights of private property, and ensuring the capitalists' rights of freedom in trade and exploitation were the class essence of the theory of "natural rights."

Furthermore, the theory of "natural rights" is an out-and-out bourgeois idealist conception of history because, first of all, this theory regards human rights as "natural." This has distorted the historical cause for the formation of human rights. The Marxist theory of the state and legal theories tells us that the so-called rights refer to certain rights and interests which law bestows on people and that those who enjoy these rights are entitled to act in a certain way and demand that other people react accordingly. Rights and duties complement each other and are closely related. "There are no rights without duties nor duties without rights." ("Selected Works of Marx and Engels," Vol 2, p 137) They emerge, exist and develop simultaneously. Rights are neither innate nor exist naturally, nor are they created or bestowed by God. The establishment of rights is closely connected with the formation of class, state and law. Before the occurrence of class, state and law, no such thing as the exploitation of man by man could or would exist in primitive society. Therefore, the situation of some people having rights and some others not having rights could never occur. Just as Engels said: "Within a clan system, there was no difference between rights and duties." ("Collected Works of Marx and Engels," Vol 21, p 180) It was only after the occurrence of the exploiting and exploited classes and the formation of state and law that rights and duties were differentiated and set against each other. "It seems that all rights have been bestowed upon a class and that all duties pushed on another class." (ibid., p 202) It is obvious that no human rights are innate, but are all recognized, stipulated and endowed by the state and law.

Moreover, owing to the fact that the theory of "natural rights" regards human rights as "eternal" and "fixed and unalterable," it negates the objective law of the development and changes of the rights of man. Dialectical materialists maintain that all things in the world are constantly on the move, developing and changing. Nothing is eternal, fixed, unalterable or absolutely static. Rights as social phenomena are no exception. It is absolutely impossible for "eternal" and "fixed and unalterable" rights to exist. Man is neither isolated nor unrestrained. Man is a summation of social relationships. In a class society, any man as a member of a class finds himself in such a social relationship. The position of "man" in the social relationship is constantly changing. In the meantime, the nature, contents and scope of rights are also continuously developing and changing. The development and changes of rights are determined by economic conditions and the nature of the social system. Rights of a different nature will occur under different economic conditions and sociopolitical systems. At the same time, the scope and contents of rights of the same social nature will also change. "Natural rights" are rights of a capitalist nature, and their contents and scope are not the same in different stages of capitalist development. Negating the changes and development of the contents and scope of rights is a metaphysical view. Rights belong to the category of superstructure, and their existence and development cannot be separated from or exceed the material conditions and scientific and cultural level of the society. Just as Marx pointed out, "Rights can never exceed the economic structure of the society or the cultural development of the society restricted by the economic structure." ("Selected Works of Marx and Engels," Vol 3, p 12) If we talk about rights without taking into consideration the nature of the political system or the economic conditions and scientific and cultural level of the society, we will not only fail to truly bring to light the objective laws governing the development of rights, but also obliterate the class nature of rights and are liable to lapse into the quagmire of idealism. The stipulations of law on rights cannot be arbitrarily decided by legislators, because economic and cultural conditions, class contradictions and class struggle have to be taken into account. The exercise of rights has to be guaranteed not only by a constitution and laws but also by fundamental material conditions. If we only proclaim or stipulate certain rights in a constitution and laws without reliable economic and cultural conditions as a basis and guarantees to ensure their realization, all these rights can only be empty phrases which cannot be realized.

Furthermore, the theory of "natural rights" regards the rights of man as "absolute" and "unrestricted." Such a view distorts the characteristics and attributes of the rights of man. Facts have proved that absolute and unrestricted rights never occur. Even the founders of the theory of "natural rights" could not deny this. Spinoza admitted that people's freedom of speech should not go beyond the limit of disturbing the tranquility of society and harming the authority of the rulers. Montesquieu said more directly: "Political liberty does not mean that people can do as they please," "Liberty means that people can only do what is permitted by law." ("On the Spirit of Law," Vol 1, p 154) While proclaiming "natural rights," the "Declaration of the Rights of Man and of the Citizen" also restricted these rights, saying: "Liberty refers to all acts which do not harm other people," "The enforcement of each individual's natural rights should be confined within the limits that other members of the society can also enjoy the same rights." All these expositions and stipulations show that rights are neither absolute nor unrestricted. They always have strings attached and restraints. In a capitalist society, rights are limited to the scope of the interests of the bourgeoisie and the "scope permitted by the law" of the bourgeoisie. They are not allowed to hamper the bourgeois rights of property, rights of politics and ruling order.

Lastly, it is because of the fact that the theory of "natural rights" regards the rights of man as "universal" that it conceals the class nature of the theory. Since the establishment, existence and development of rights are connected with class and they are bestowed by the state and law, they cannot be "universal" and treat all classes equally without discrimination. In a class society, "man" does not transcend classes and national boundaries, but belongs to a certain class and nation. Any rights of man are rights of class, which are characterized by a distinctive class nature. The theory of "natural rights" replaces man belonging to a class with abstract "man" and the class nature of rights with the "universality" of rights. All this fully exposes the hypocrisy of this theory. In a capitalist society, rights are based on the antithesis between classes. The bourgeois state and law protect the rights of the bourgeoisie, and restrict and expropriate the rights of the proletariat. The rights of man and other democratic rights stipulated in the constitutions and laws of bourgeois states are true for the bourgeoisie and can be realized. The reasons are simple. It is because the bourgeoisie controls state power, wields the power for formulating and enforcing the law and possesses the means of production and all material conditions for exercising democratic rights. It relies on the state power to maintain its property relationships and rule of capital. Owing to the fact that the proletariat and the laboring masses do not possess any of these things, to them rights stipulated in laws are no more than empty talk which cannot be realized. The reason why bourgeois countries contain such high-sounding stipulations in their constitutions and laws is to deceive the proletariat and the laboring masses, mitigate the contradictions between the proletariat and the bourgeoisie and do some window dressing for the democracy and freedom of bourgeois nations. In the final analysis, their purpose in doing so is to maintain the reactionary rule of capitalism. Right from the first day when the bourgeoisie made its promise to the proletariat and the laboring masses, it never intended to make good this promise. On the contrary, it tried by hook or by crook to restrain and prevent the proletariat and the laboring masses from exercising their rights of democracy and freedom by utilizing its constitutions and laws. More and more such restrictions have been imposed. For example, the present U.S. federal law explicitly stipulates that nobody is allowed to use freedom of speech and of the press to "harass society" and propagate "violent revolution." With regard to the right to vote, many restrictions have been imposed, including the level of education, property conditions, length of residence, and so forth. The government can at any time use administrative orders to deprive the laboring people of their basic rights. Under such circumstances, it is difficult for the proletariat and the laboring masses to exercise their democratic rights which will protect their class interests, but also harm the interests of the bourgeoisie. Therefore, while using the rights of democracy and freedom and various civil rights stipulated in the constitutions and laws of the bourgeois countries to carry out "legal" struggle against the bourgeoisie and strive for the improvement of their political status and living conditions, the proletariat and the laboring masses should not be misled by the false appearances of bourgeois democracy and freedom. They should constantly raise their class consciousness and carry out their struggle to overthrow the reactionary rule of the bourgeoisie.

In a word, the rights of man are not "natural," but conferred and stipulated by the state and laws; the rights of man are not universal, but characterized by distinct class nature; the rights of man are not abstract, but specific; the rights of man are not absolute, but restricted by laws and ethics; the rights of man are not eternal, fixed and unchangeable, but their nature and applicable scope change as man's role in the material productive conditions and position are constantly changing. Different countries with different social systems have rights of different class characters. This is the basic viewpoint of Marxism-Leninism on the rights of man, which is sharply antagonostic to the theory of the "natural rights" of the bourgeoisie.

III

It is true that Marxists do not deny human rights altogether, but adopt an attitude of historically and specifically analyzing them. In the present-day world, "human rights" have become a popular slogan which is widely accepted by various countries and a tool for carrying out modern international and political struggle. With the progress of history, the concept of human rights has also undergone a new development. For example, in the past 10 or 20 years, the newly emerging countries--the Third World--have put forth a series of rights upholding national self-determination, defending the independence and sovereignty of nations, developing the national economy, freely dealing with various countries' wealth and natural resources, opposing foreign aggression, oppression and plunder, and demanding that a rational and new order based on the equality of various nations be established in international economic relations. All this has infused new contents into the concept of human rights. It has occurred as the opposite of imperialism, colonialism, racism and hegemonism and marks an important development of the traditional concept of human rights. This has further developed the concept of human rights. Of course, we agree to such a progressive concept of human rights and support the international struggle based on it.

In building socialist democracy, we should adopt an analytical and critical attitude toward the traditional concept of human rights, which was smashed by the emerging national and democratic movement as early as after World War II. We should interpret human rights in a way which conforms with Marxist principles. Moreover, we should use more scientific and truthful concepts--the rights of citizens--to expound our country's view on human rights. However, some people appreciate the theory of "natural rights" as a gem, saying that "man is born with the right to democracy and freedom" and that "absolute freedom of thinking and speech should be guaranteed." Some people even advocate that the bourgeois multiparty system and parliamentarism and election system be introduced to socialist China. They believe that the "socialist system is not as good as the capitalist system" and that "socialist democracy is inferior to bourgeois democracy." To them, Marxism-Leninism-Mao Zedong Thought no longer works and what they do is seek help from the bourgeois theory of "natural rights." The reason for the occurrence for this ideological trend is: During the 10 chaotic years, the Lin Biao and Jiang Qing counterrevolutionary cliques sabotaged the socialist democratic system and this ideological trend is a kind of historical punishment. Apart from that, in recent years, some people have been influenced by bourgeois ideology from abroad. Actually, the Chinese people had experience of the theory of "natural rights" long ago. Early this century, when Marxism had not yet been disseminated in China, Chinese bourgeois thinkers introduced the theory of "natural rights" to China from Western countries as a "new learning." They tried to use this theory to rescue old China, which was dark and backward, and establish a bourgeois republic. What was the result? Their efforts ended in failure. People who know a bit about modern Chinese history have probably not forgotten this. The theory of "natural rights" did not work in old China, let alone in the new period of socialism. If the theory of "natural rights" is preached again, does that not mean a great retrogression of history?

It is undeniable that there is room for improvement in our country's socialist superstructure and there are some shortcomings in certain aspects of our state system. However, what strength should we rely on to eliminate these defects? We should only rely on the strength of the socialist system and the broad masses of people and the leadership of the Communist Party and the guidance of Marxism-Leninism-Mao Zedong Thought, bring into full play the role of socialist democracy and improve the socialist legal system. We should on no account seek help from the bourgeois theory of "natural rights." Since the 3d Plenary Session of the 11th CCP Central Committee, the party and government have adopted a series of effective measures and done a lot of work to carry forward socialist democracy and improve the socialist legal system. We have reexamined and redressed throughout the country a great number of false charges, wrong sentences and frame-ups; implemented policies for cadres, intellectuals and nationalities and other policies; and strengthened the work of the people's congresses at all levels, established permanent organs for the people's congresses at the provincial and county levels, and established direct elections for people's deputies at and below the county level. We have restored and improved staff members' representative assemblies and drawn the masses to participate in state affairs, economic and cultural affairs and the affairs of social development. We have carried out criticism and self-criticism in the press and strengthened the masses' supervision over the organs of the party and government and their working personnel. We have strengthened legislative and judicial work and enacted a series of basic laws, including criminal law, law on criminal procedure, law on civil procedure, law on economic contracts and so forth. Our country's legal system is being gradually improved. The execution of these measures has guaranteed people's democracy and expanded their rights of being the masters of their own affairs. In particular, the "Guiding Principles for Inner-Party Political Life," adopted by the 6th Plenary Session of the 11th CCP Central Committee, has stressed that our country "will gradually build a highly democratic socialist political system" and that the building of the state organs at all levels should be strengthened in accordance with the principle of democratic centralism so that people's congresses at all levels and their permanent organs will become authoritative organs of state power of the people. We should gradually promote people's direct democracy in basic-level organs of state power and social life and exert great efforts to develop the laboring masses' democratic management in production. All this incontrovertibly proves that only the socialist system can ensure the full exercise of the people's various rights. It will not work and can only become frivolous and fantastic talk if we deviate from socialist democracy and the legal system and socialist modernization to talk about the problem of human rights.

Our country's socialist democracy is being strengthened and developed. It is, in essence, far superior to bourgeois democracy. It ensures the democracy of the majority of people to be the masters of their own affairs. Socialist democracy is democracy in both name and reality. The idea that "socialist democracy is not as good as bourgeois democracy" is a groundless bias. We firmly believe that in the struggle of the people of the whole country for building socialist material and spiritual civilization, our country will continue to expand the people's democratic rights and establish the most extensive and beautiful socialist democracy of mankind.

STRENGTHEN SOCIALIST EDUCATION IN THE COUNTRYSIDE

Beijing RED FLAG in Chinese No 7, 1 Apr 82 pp 37-40

[Article by Fan Kang [5400 1660]]

[Text] In the rural areas of our country, the implementation of the principles and policies worked out since the 3d Plenary Session of the 11th CCP Central Committee, and particularly the recent years of extensive practice of the various forms of production responsibility system, has aroused the enthusiasm of the masses of peasants; grain production and the diversified economy have been rapidly revived and developed and the livelihood of the overwhelming majority of the peasants has been improved in varying degrees. This is a situation that has not been seen for many years. However, at the same time we must see that this is just a beginning, the foundation has still not quite been consolidated, and quite a few new contradictions and new problems have surfaced. Therefore, it is imperative to continue to exert arduous efforts, strengthen investigation and study, work in a down-to-earth manner, and especially give more effective leadership to the ideological position and do more extensive and thorough ideological and political work among the broad peasant masses.

What is the basic task of the ideological and political work of the CCP in the rural areas at present? Briefly, it is to persevere unremittingly in carrying out socialist education among the peasant masses.

The vast numbers of peasants have consistently held an important position in the Chinese revolution and construction and have made and are continuing to make their unique important contributions. Since the founding of the PRC, our party has adopted a series of correct policies and measures and led the hundreds and millions of peasants in taking the socialist road. There is no doubt that the broad peasant masses have a reservoir of enthusiasm for socialism. Then does this mean that we need no longer carry out socialist ideological education among the peasant masses? That is really not so. China is a big country with a history of more than 2,000 years of feudalism. The influence of the ideology and habits left over by the age-old mutually separated individual economy is deep-rooted in the rural areas. At the same time, because of the "leftist" mistakes committed in our guiding ideology in the past, and particularly the sabotage carried out for years by the Lin Biao and Jiang Qing counterrevolutionary cliques, egalitarianism, poverty, unitary system of the means of production and the single-product economy, excessively rigid control, and so on, were regarded as the so-called essential properties of socialism and the peasants were forced to accept them, thus bringing about great confusion in people's minds. Over the past few years, in encountering this state of affairs, our party has resolutely brought order out of chaos and established the production responsibility system, a new form of operation and management, in the light of the need for reviving and developing production. This is a great change in the countryside. Quite a few people have failed to follow up ideologically, or they have misunderstandings, doubts and misgivings in one respect or another, which can be summarized in incisive questions: Is what is being practiced now aimed at practicing socialism? Do we still need to practice socialism? Practice demands the party of the working class to frequently give ideological and political education and provide correct guidance to the peasants. The rural party committees at various levels must frequently imbue the peasant masses with correct but not distorted socialist ideas (including the socialist road, socialist policies and the future of socialism) with specific objects in mind and help them more conscientiously continue to forge ahead along the path charted by the 3d Plenary Session of the 11th CCP Central Committee.

In the light of the actual situation at present, in carrying out socialist education, we must concentrate on the following tasks:

First, extensively and thoroughly propagate the correctness, great significance and socialist nature of the principles and policies of the CCP Central Committee since its third plenary session.

The vast numbers of peasants all understand that the improvement of their livelihood over the past few years is the product of the party's principles and policies since the 3d Plenary Session of the 11th CCP Central Committee. During the 10-year turmoil, there was a peasant in a rural area of northwestern Shandong Province who toiled all the year round without enough to eat and wear. He sought divine advice and promises year after year, but life for him still did not show the slightest improvement. The new policies formulated by the 3d Plenary Session of the 11th CCP Central Committee, especially after the implementation of the production responsibility system, enabled his family to come into their own economically at a rapid pace and to embark on the road to prosperity. After the autumn harvest last year, seeing that their house was full of grain and cotton, his daughter-in-law teased him: "Dad, are you still going to seek the advice and help of gods this year?" The old man cheerfully answered: "Oh, no, no. We must attribute all we have today only to the 3d Plenary Session of the 11th CCP Central Committee!" Look, the old man in a remote district also knew that his prosperous life was the result of the correct policies of the CCP. The "leftist" rural policies practiced during the "Great Cultural Revolution" brought about one result, and today's correct rural policies have produced another result. Contrasting these two results, the peasants have a very clear idea in their minds. We must firmly grasp this favorable opportunity and adopt various vivid and vigorous as well as concrete and effective forms to propagate the party's rural policies, and particular stress should be put on the socialist nature of these series of policies so that the peasants can see through their own immediate interests the brilliant prospects of the socialist collective economy and have a deeper love for socialism.

At present, because the remnants of "leftist" ideology are still playing a role, some cadres of the communes and their subdivisions regard one or two concrete forms of the production responsibility system (such as the system of fixing output quotas for individual households and that of assigning the households full responsibility for task completion) as the practice of dividing the fields and working alone and as retrogression to the old society and oppose and obstruct them as a result. Owing to the ideology and habits left over by the old society, some peasants consider the production responsibility system as a practice of "everyone looking after himself" and as nothing to do with socialism. Although these two kinds of erroneous ideas vary to some degree, they all stem from the misunderstanding of our policies. Our party's ideological work must have a definite object in view. At present, efforts must be concentrated on eradicating these misunderstandings. The overwhelming majority of the peasants are very happy about the present policies, but at the same time, they are afraid that the policies might change at any time. So, some of them go to the entrance of their villages to wait for newspapers every day. This idea of being afraid that the present policies might change at any time is, of course, related to the mistakes existing in our work on the one hand and is caused by the fact that they have an insufficient understanding of the socialist nature of the present policies, do not feel secure about the present policies and thus lack the proper steadfastness on the other hand. We must clearly state that the production responsibility system is only a change in the operation and management of the socialist agricultural collective economy and it does not touch on the system of collective ownership of the basic means of production. Take, for example, the system of assigning to the households full responsibility for task completion. It is a relationship of a contract between the peasant households and the collective, a relationship which is based on the system of public ownership of land. This system puts land, large-scale farm machines and tools and water conservancy facilities under the unified administration and use of the collective, accepts state planning and guidance, has certain public deductions, arranges the livelihood of the families of armymen and martyrs, the households enjoying the "five guarantees" and the families with material difficulties in a unified way, and in some cases it carries out agricultural capital construction in a unified plan. So it is a component part of the socialist agricultural collective economy rather than the individual economy of small private ownership existing before cooperativization. Along with the development of the productive forces, it will develop and become a more perfect collective economy step by step. We must still clearly state that our party and government will uphold that the road of socialist collectivization, and that the system of public ownership of the means of production such as land will not change for a long period of time and that the implementation of the production responsibility system in the agricultural collective economy will not change for a long period of time. So, the peasants can set their minds at rest.

The rural grassroots party organizations generally attach importance to carrying out ideological and political education among the peasants. The problem is that some localities regard this ideological and political education only as a means of bringing a certain concrete policy into force (it is necessary). They more often than not judge the case as it stands and neglect to carry out such education on the higher plane of the whole socialist education. The purpose of any work we communists do is both to attain the current concrete goal and to fundamentally enhance the socialist consciousness of the masses. Putting one-sided emphasis on concrete work at the expense of the big goal of educating the peasants in what is of fundamental importance is a tendency of routinism, which we must take care to guard against and overcome.

Second, carry out the education of correctly handling the relations of the state, the collective and the individual in a regular and sustained way.

In the rural collective economy, the relations of the state, the collective and the individual are more distinctive than those in the national economy and are more fully manifested in the various aspects of production and livelihood. This requires us to constantly pay attention to studying and readjusting it. Practice has consistently put these problems before the party's ideological and political work and has demanded that we adapt ourselves to different conditions and adopt different forms to find correct answers. The introduction of various forms of the production responsibility system in the rural areas, and particularly the form of fixing output quotas for individual households and the form of assigning the households full responsibility for task completion, has all the more made the correct understanding and handling of the relations of the state, the collective and the individual become a fairly striking problem. Take, for example, the form of assigning the households full responsibility for task completion. It raises the formula: "Hand over the amount originally agreed upon to the state, reserve the full amount for the collective and the rest is all one's own." This is a formula for handling the relations among the three parties. There is inevitably a struggle of different ideas in this respect. The other forms of the production responsibility system put solutions to the problem of the relations of the state, the collective and the individual in their own ways, and there are also ideological contradictions of one kind or another in this respect. This is not in the least strange. This is because putting principles into effect invariably requires a complicated process and is usually not as direct and smooth as one would wish. In addition, people's ideological consciousness is not uniform and in this respect there is a distinction between the advanced and the backward; in terms of people's vision, there is a difference between the farsighted and the shortsighted. There is a lot of work to do in unifying people's understanding. Therefore, we must conduct ideological work in a thoroughgoing manner.

In order to educate and lead the vast numbers of peasants in correctly handling the relations of the state, the collective and the individual, it is necessary to uphold the principle of simultaneously taking the interests of the state, the collective and the individual into account and not to concentrate on one thing only. At present particular stress should be put on the following tasks: 1) Take the planned economy as the dominant factor and regulation by market mechanism as the supplementary factor. This fundamental principle is also applicable to the countryside. Giving play to the decisionmaking power of communes and their subdivisions must be carried out under the state's unified planning. Going beyond the orbit of state planning will directly or indirectly infringe on the interests of the state. That is entirely wrong. One of the important reasons for some localities unrestrictedly expanding the area sown to tobacco and reducing pig breeding is that the peasants do not pay proper attention to ensuring the fulfillment of state plans. We must repeatedly emphasize to the peasants that the economy can be reinvigorated only under the guidance of state planning. It is wrong to impose excessively rigid control over everything, but anything which should be carried out in a centralized way must be properly put under unified administration. The peasants are only allowed to carry out their activities within the bounds of state planning. This will be conducive to the long-term interests of the peasants and the state can smoothly carry out its construction as a result. Departing from the guidance of state planning to seek the development of the small collective and even that of the individual will inevitably damage the interests of the entire people including the collective and the individual. Naturally, it is essential not to indulge in harmful directives, but correct state planning is absolutely indispensable. Therefore, while implementing the production responsibility system, it is imperative to strictly observe state planning, resolutely perform production contracts in full and not to violate them in any sense of the term. To ensure the interests of the state, it is essential to strictly act according to the guidance of state planning and carry out the state purchases and assigned quotas without fail. Correctly handling the relations of the state, the collective and the individual must first find expression in this respect. 2) At present, some peasants are not so enthusiastic about making deductions to the collective and even refuse to fulfill their obligations. It is obviously wrong for them to lump together the practice of some cadres taking more than their share with collective deductions. The collective deductions we have referred to here partially include various fields, such as accumulation funds and public welfare funds. The necessary subsidies for cadres constitute only a tiny amount of collective deductions. All this is indispensable for consolidating the socialist collective economy. If the socialist collective economy is fundamentally shaken, the whole interests of the state will not be ensured and our personal interests will lose their backing. Therefore, we must never set the interests of the individual against those of the collective. The vast numbers of rural cadres assiduously serve the people and a considerable number of them are so devoted to public service as to forget their own interests. There does exist the phenomenon in which a tiny number of cadres take more than their share. Our party resolutely opposes this practice. It confuses right and wrong to equate collective deductions with the practice of cadres taking more than their share. Using opposition to the practice of cadres taking more than their share as an excuse to refuse to provide deductions to the collective is in fact the reflection of the selfish mentality of small production. People with these erroneous ideas are expected to make amendments through education. Concerning oneself with the interests of the collective and safeguarding collective property are the basic requirements for the socialist collective peasants. Particular attention should be put on this point. 3) At present, a small section of peasants concentrate only on personal gains. Consciously or unconsciously, they seek one-sided development of themselves by trying to separate the personal interests from the relations of the state, the collective and the individual, a relationship which is inseparable. Some of them even harm the collective or use the pretext of boosting the interests of the collective to fleece the state. This is a harmful tendency. We must adopt effective measures to correct it rather than let it go unchecked. The production responsibility system is a means of socialist operation and management. In both the system of fixing output quotas for individual households and that of assigning the households full responsibility for task completion, there are both unified administration, and contracting rather than exclusive contracting. What is fundamental and plays a decisive role is the socialist economy. This is a major premise which brooks no violation. It is inevitable that differences will emerge, in that some commune members will become prosperous earlier and some later and that there will be differences in varying degrees among commune members. People who have now become prosperous or highly prosperous must enthusiastically help, on their own accord, those who have material difficulties for the time being. They must only look after themselves, still less infringe on the interests of others and the state. The relations of mutual aid in unity between the people is one of the important indications of socialist society. Opposing selfishness and encouraging the idea of doing everything for the country and the public are precisely an important content of socialist education. We must consistently pay close attention to it.

Third, carry out education in maintaining social public security and improving social customs in a big way.

Over a period of time, in some places in the countryside there have been various disputes and contradictions and a strained relationship among a section of people. What brooks no neglect is that some phenomena of breaking laws and violating discipline have developed. While rejoicing at the development of production and the improvements of livelihood, the broad masses of peasants feel anxious only about the worsening social public security. We must not treat the voice of the masses with indifference. The rural basic organizations must give full play to the role of political power inherent in them and adopt effective measures in maintaining social public security. Of course, it is first necessary to carry out education in a widespread way, mobilize men and women, old and young in the countryside to bring the superiority of socialism into play and to wage resolute struggle against the crimes of a handful of people by relying on organized forces. In some places, and particularly in some coastal rural areas, where there is no regard for productive labor, some peasants engaged in speculation and profiteering and even smuggling, thus committing economic crimes. We must oppose the corrosive influence of bourgeois ideas and deal blows at all offenses against the law, which endanger the socialist system.

With regard to the various conflicts of interests among the peasant masses, we must widely build socialist spiritual civilization through activities such as the "rules and regulations for villagers" and "five-good families." Everybody is encouraged to foster good ideology and good work style, such as loving the country as one's own family, putting other people's interests ahead of one's own and helping each other in unity to build a new socialist countryside. Some of our comrades more often that not have a one-track mind and concentrate on one thing only when they begin to work. When they are called on to grasp production, they exclusively concentrate on production. They do not attach proper importance to the building of socialist spiritual civilization. They little imagine that without the building of socialist spiritual civilization, production will certainly suffer. Therefore, the education in maintaining social public security and improving social customs should also be taken as a consistent basic task of our party's ideological work in the rural areas.

It cannot be denied that the introduction of the various forms of the production responsibility system in the rural areas has caused some new problems, both in organizational forms and work methods, for the party's ideological and political work. Now, with regard to propaganda and education work among the peasants, we must do it in a more thoroughgoing, solid and practical way, with the aim of really seeking solutions to the various problems to which the peasants pay close attention and about which they have no idea. Ideological and political work like this will be really welcomed by the peasant masses. In some places in the countryside, cadres of certain production teams refused to take further part in collective affairs. Such being the case, the commune members organized themselves spontaneously and had "team activities" at a fixed time (say, a month or half a month) to keep abreast of state affairs and study the teams' own affairs. Facts have proved that the peasants concern themselves with state affairs and need ideological and political work. The problem is that we must find a new method suited to the new conditions. After substantially reducing the interference in economic matters, the rural party branch committees must exert more energy and effort on studying the ideological conditions of the peasant masses, studying the party's principles and policies and carrying out ideological education among the peasants in a way that suits the remedy to the case. After diverse forms of the production responsibility system were introduced, we had more, rather than fewer, backbone elements whom we could rely on. The basic party organizations must establish various forms of relations with them and arouse them to carry out vivid and vigorous socialist education among the peasant masses, closely centered on the main subject of continuing to implement the party's rural principles and policies and making further advances amid the already very good rural situation and prospects. In carrying out socialist education among the peasants, it is first necessary to strengthen the party ranks and rely on them in carrying out vivid and vigorous propaganda and education work among the broad masses.

Our party has accumulated rich experiences in the mass work which the party has carried out in the countryside for long years, the most important of which is the pressing need to give play to the exemplary role of party members and the vanguard role of rural youth. At present, some rural party members ask the party branch committees for assignment of tasks to carry out ideological work among fixed households of their own accord. With a sense of pride rarely seen for many years, some veteran party members who were enthusiasts in the years of the land reform and are now already 50 or 60 years old contracted to contact and arouse large numbers of peasant households to help the poor become prosperous and to foster healthy practices and drive out unhealthy ones. They have done their work successfully. By working independently, they have enhanced their ability and won the respect of the masses. Young people invariably constitute a dynamic force. They are highly energetic and full of vigor, and they are the ones least influenced by old conventions. Party organizations must organize them through the CYL and help them to give full play to their proper and great role in carrying out socialist education and in building a new socialist countryside. So long as the leading members of the rural grassroots party organizations take the lead and closely rely on the two forces--the vast numbers of party members and young people--and create various effective methods in practice, rural ideological work will certainly be carried out in a vivid and dramatic way and will bring about incalculable material results.

CSO: 4004/30

CHANGE HABITS AND CUSTOMS AND MAKE THE ENVIRONMENT MORE BEAUTIFUL

Beijing RED FLAG in Chinese No 7, 1 Apr 82 pp 41-43

[Article by Yang Rupeng [2799 1172 7720]]

[Text] In carrying out courteous activities of the "five stresses and four points of beauty," the leading comrades of the CCP Central Committee have taken the lead and set good examples by participating in cleaning up and public health activities as well as by planting trees. But some people regarded these activities as a trifling matter and thought that it was unnecessary for leading comrades to take the lead and mobilize the masses. Are tree planting and public health activities important matters, and do they have any social significance?

The beautification program and public health activities are in the interest of improving the health of the entire nation. An environment that is covered with trees and shrubs, that is clean and beautiful, will help people to get rid of dirt, diseases, pollution, noise, and certain miseries and annoyances caused by natural calamities, and will improve people's physical well-being and make them happy and vigorous. The influence of the hygienic environment on the health of people is easy to understand. Marx said that public health work was important because this work would "protect the health and well-being of the labor force which is the basic source of all value." ("Collected Works of Marx and Engels," Vol 26, p 159) Comrade Mao Zedong also said that public health work was important because it was in the interest of production, work and study and in the interest of transforming the weak physiques of the Chinese people and making them healthy. This is an important matter directly related to the physical condition of the people, the strength or weakness of the country and the continuation of the nation; it is also related to maintaining social material production and spiritual production. Therefore, it is only natural that health be an important aspect of spiritual civilization. Under the cruel exploitation and suppression of the ruling classes before liberation, many of the urban and rural areas in our country were dirty and disease-ridden, and the people's physiques were very weak; the nation was called by some foreigners the "sickman of Asia." Following the establishment of the PRC, and owing to the concern of the party and the government and the efforts made by various health departments and medical personnel, health and disease prevention networks were set up at various levels and patriotic public health campaigns were carried out in depth. As a result, the health of our people has improved considerably, the average lifespan has increased, and the hygienic conditions in both rural and urban areas have been drastically improved. The great contributions of public health work in promoting the health of people across the country would have been unimaginable in the old China. But, at the same time, we must understand that it is a very arduous task to create a clean and hygienic environment and change the habits of paying no attention to health and courtesy. Therefore, it is necessary for us to carry out the "five stresses and four points of beauty" activities, carry out ideological education, and popularize knowledge about health and science so that people will be aware of the significance of paying attention to hygiene and of the serious hazards of not doing so. People must be mobilized to disseminate and persuade others to pay attention to hygiene--coupled with necessary and strict punishment measures--so that the good habit of "everyone is paying attention to hygiene, every household is clean and everyone is active in preventing pollution" will gradually become widespread, coupled with the building of a strong momentum of public opinion. The masses must be mobilized to clean all places, improve hygienic conditions in both rural and urban areas, and improve the hygienic environment in big and medium-sized cities.

In the past, we did not do much work to publicize the importance of planting trees for the health of the people, and the broad masses of people still do not have a necessary understanding of its importance. Enormous scientific research work and statistics on experiments have shown that forests and trees keep the air fresh, improve the climate, prevent blowing dust and lower noise pollution. Some trees, shrubs and flowers produce elements that kill bacteria and thus prevent some diseases. Other trees are helpful in detecting the extent of environmental pollution. Many areas of the world where people are living longer lives are characterized by mountains and rivers, and quiet and beautiful environments. To cover soil with green plants is not only in the interest of people's health, but also beautifies the environment; it is in the interest of the people that this work be done in a big way.

The campaign for planting trees and paying attention to public health is of great significance for the development of the national economy. When Lenin referred to industrial production, he said that it was necessary "to make labor conditions more healthy, to enable tens of millions of workers to work in hazard-free areas by eliminating smoke, dust and mud and to quickly transform the dirty and disgusting workshops into clean, bright and comfortable laboratories." ("Collected Works of Lenin," Vol 19, p 42) As we know, men are the most important and active factors in the productive force. To change the dirty and chaotic environment is in the interest of promoting people's physical conditions and of improving work, labor and study efficiency and is consequently in the interest of promoting the development of productive force. Furthermore, modernized mass production depends on equipment, instruments and meters and other advanced equipment with very high precision and sensitivity. In order to ensure smooth operation of this equipment and enable them to be used for the longest possible time, it is necessary to carry out civilized production. Paying attention to hygienic conditions and keeping the environment clean and beautiful is an indispensable condition and important part of such production.

Planting trees is very important in developing the national economy, and this work must be particularly stressed at the present stage because it is not only important but also urgent. Developed forestry is a criterion for state wealth, national prosperity and social civilization. Forests are valuable resources for the national economy because they provide us with timber and various forestry sideline products, but what is more important is that forests have a very important role of maintaining natural ecological balance. They constitute a very important condition for ensuring high and stable yields in agriculture and animal husbandry. In fact, forests play many roles in this respect. For example, they retain water resources, weaken surface and underground currents, preserve soil and water, act as windbreaks and sandbreaks, reduce pollution and partially regulate the climate. Therefore, to plant trees and develop forestry is a basic aspect of farm capital construction, a strategic measure in transforming nature, and a great cause that will benefit present and future generations.

People's understanding of the role of forests gradually deepens with the development of society and science. In ancient times, people were only aware of forests from the angle of their direct interest, which meant that forests provided them with timber and various forestry sideline products. They understood very little or did not understand at all the indirect interest they could get from forests. Following the development of agriculture, animal husbandry and industry, people began to reclaim lands and herd their animals in a way that damaged forests and to fell trees excessively. In addition, forests have been damaged by wars, fires and pests. As a result, the acreage of forests has decreased and the supply of timber is decreasing, and at the same time there have appeared natural calamities such as floods, drought, winds, sand and environmental pollution. When Marx was referring to the influence of the activities of mankind on the natural environment, he said: "It is only men that leave their own imprint on nature. That is because they have not only changed the position of plants and animals but also changed the outlook and climate of the places where they are living." ("Collected Works of Marx," Vol 20, p 373) That is to say, on the one hand, mankind has made increasing achievements in understanding and transforming nature, but on the other hand, he has caused a series of environmental problems. Therefore, "we must in no way become intoxicated with our victories over nature. Nature has taken its revenge on us for each of our victories. There is no doubt that we achieve the anticipated results in the first step of each victory, but the situation is always quite different in the second and third steps. It is often the case that the initial results are offset by unexpected influences." ("Selected Works of Marx and Engels," Vol 3, p 517) Engels pointed out that in the mid-19th century, the Russians recklessly felled trees and caused serious consequences that "have impoverished the soil in many regions." ("Collected Works of Marx and Engels," Vol 22, p 457) In our country, the loess plateau along the middle reaches of the Huanghe River was originally covered with forests and grasslands; it was a zone with prosperous agriculture and animal husbandry and the cradle of the Chinese people. The forests were later seriously damaged, which caused numerous calamities following big-scale construction undertaken by various rulers in history, damage during various wars and reckless logging of trees. In the contemporary era, the region has been subject to frequent natural calamities such as floods and droughts, and the river now contains more silt than any other river in the world. This problem is not just confined to the Huanghe River. We have made certain achievements in forestry construction over the past 3 decades and more since the founding of the PRC, but because of the very weak forestry foundation and the interference of the "leftist" guiding ideology, the situation of our forests is still lagging behind and they are far from meeting the needs of the development of the national economy as well as the people's livelihood. Our country is still one of the countries in the world with very low forest coverage. In addition, the distribution of our forests is not balanced, while many regions are characterized by serious ecological imbalance and soil erosion which have seriously affected the development of agriculture and animal husbandry. To make our country green and restore and develop forests is a very arduous and urgent strategic task of the whole nation. We must be clearly aware of this situation, take active measures and respond to the "Resolution on Unfolding an All-People Voluntary Tree-Planting Campaign" passed by the 4th Plenary Session of the 5th NPC and contribute to making our motherland green.

The tree-planting and hygiene campaign is a matter of changing habits and customs, and an important aspect of beautifying the environment and building spiritual civilization is that this will help promote the development of the political consciousness of the broad masses of people and form good social practices. These benefits can be said to be the basic spirit for our waging the tree-planting and hygiene campaign. Lenin once termed pernicious and infectious diseases and typhus as "bad consequences of Russians' uncivilizedness, poverty and ignorance." ("Collected Works of Lenin," Vol 30, p 198) He also pointed out that to eliminate these diseases and the louses that spread them "is our first measure for civilization." (ibid., Vol 30, p 160) Consequently, he personally signed the decision to allot fees for cleaning works in Moscow and meticulously inspected the nationwide activities of "hygienic environmental week" and advocated that "Moscow must set an example in cleanliness." (ibid., Vol 35, p 528) Planting trees and paying attention to hygiene is the common cause of hundreds of millions of people and such a campaign can draw the broadest masses of people to participate. This campaign cannot make achievements in a short time. Therefore, we must persist in tirelessly carrying out ideological education, hard work and management for years in succession. Comrade Hu Yaobang has pointed out that the campaign is closely related to the spiritual outlook of the entire Chinese people. To have done a good job in planting trees and paying attention to hygiene means to have demonstrated our organization and discipline, and this achievement represents our civilization, which arouses people's vigor.

The CCP Central Committee has highly valued the great political and economic significance of the tree-planting and hygiene campaign and considered the present national conditions and the ideological situation of the broad masses of people, and consequently it calls for doing a good job in cleaning, hygiene and tree planting to change the dirty environment as a breakthrough in building socialist spiritual civilization. It is not an easy job to change the habits and customs of tens of millions of people and overcome the difficulties that have accumulated for many years, nor can this work be completed at a stroke. But the Chinese people have a good tradition of paying attention to hygiene and planting trees, we have the powerful leadership of the party and the superior socialist system, excellent national conditions and industrious people. Therefore, as long as the party and government organizations at all levels are able to step up their ideological and organizational leadership, make overall arrangements, and mobilize the masses and are persistent in carrying out their work in a down-to-earth way, a clean and beautiful environment covered in green is sure to emerge in our urban and rural areas.

FALSE HISTORIOGRAPHY SERVING REGIONAL HEGEMONISM--COMMENTING ON SOME FALLACIES IN THE HISTORIOGRAPHY OF VIETNAM

Beijing RED FLAG in Chinese No 7, 1 Apr 82 pp 44-48

[Article by Dai Kelai [2071 0668 0171] and Xu Yongzhang [6079 3057 3864]]

[Text] Ever since the unification of the northern and southern parts of Vietnam, the Le Duan clique has been frenziedly pushing regional hegemonism in a vain attempt to dominate Southeast Asia. It has published numerous volumes of so-called historical works which, meeting the needs of its policy of aggression, distort historical facts, confuse right and wrong, make malicious remarks by innuendo and even go to the extent of openly spreading slander. In Vietnam today, historiography has actually become an instrument used by the Vietnamese authorities to push regional hegemonism.

A Fabricated "Van-Lang State"

To put Vietnam in a higher historical position, some Vietnamese historians have put back the date of the ancient history of Vietnam to an even earlier period. They assert that the Vietnamese "established the Van-Lang Society with a unique Bronze Age culture 3,000 to 4,000 years ago and that the Vietnamese nation was obviously extraordinarily strong." (Nguyen Linh and others: "The Question of the Hung-Vuong Kings and Archaeology" carried in Vietnam's HISTORICAL RESEARCH, March 1968, No 108, p 23) They even say that in ancient Southeast Asia, "a representative culture stemmed from the ancestral home of the Vietnamese" and ancient Vietnam was "a unique center of Southeast Asian culture." (Dang Nghiem Van: "The Course of Formation and Development of the United Vietnamese Nation" carried in Vietnam's HISTORICAL RESEARCH, March-April 1978, No 179, p 10) They also boasted that ancient Vietnam "was an agricultural center of the world." (Pham Huy Thong: "Bronze Drum" carried in Vietnam's SPECIAL ISSUE ON BRONZE DRUM, Vol 1, p 10) In short, they seemed to say that everything Vietnamese was the "best" in Southeast Asia so that Vietnam should naturally be the overlord of the region.

Anyone with rudimentary historical knowledge knows that the authentic recorded history of Vietnam could not possibly be dated back to earlier than China's Qin dynasty. In 207 B.C., Zhao Tuo, a Qin official in charge of the border area, founded a local independent state of Nanyue with the city of

Guangzhou as its seat of government. He established Jiaozhi Prefecture in the northern part of today's Vietnam and Jiuzhen Prefecture in the northern part of today's central Vietnam. This was the first Vietnamese political power recorded in history. In the ancient history of Vietnam, the Nanyue State was considered an orthodox governmental state and named the Trieu (Zhao) dynasty, and Zhao Tuo was called the founding ruler of the state of Vietnam. (Le Van Huu, a scholar specializing in ancient Vietnamese history, said: "Emperor Vo of the Trieu dynasty opened up the land of Vietnam and founded his empire there.... He rendered immortal contributions to the founding of an empire in Vietnam!" ("Complete History of Great Vietnam: Supplement," Vol 2) He regarded Zhao Tuo as the founder of Vietnam. In his "Binh Ngo Imperial Mandate," Nguyen Trai said: "Ever since our country was founded by the Trieu, Dinh, Ly and Tran families...." He regarded the Trieu dynasty as the first political power of Vietnam. Neither of them mentioned the "Van-Lang State.")

Not only foreign scholars studying Vietnamese history but also Vietnamese historians doubt the existence of the "Van-Lang State." According to the ancient history of Vietnam, the "Van-Lang State" existed for 2,622 years from 2879 B.C. to 258 B.C., during which time 18 Hung-Vuong kings reigned. Vietnamese bourgeois historian Tran Trong Kim pointed out: "Each of the Hung-Vuong kings was on the throne for an average of about 150 years. Though they lived in ancient times, it was hardly possible that such a great number of people would live such a long life." (Tran Trong Kim: "General History of Vietnam," Vietnamese version, p 25) This remark alone showed that the existence of the "Van-Lang State" was unbelievable. French Sinologist Henri Maspero also doubted the "Van-Lang State." (H. Maspero: "Van-Lang State," carried in "Collected Papers of French Institute of Far East Ancient Studies," No 18) Dao Duy Anh and some other Vietnamese historians shared his doubts. Dao Duy Anh said: "The Van-Lang State can only be a fabrication." "We should not rigidly hold that the word 'quoc' (state), being the area ruled by Hung-Vuong kings, meant a state in the sense that it does today." (Dao Duy Anh: "King of An-Duong and the State of Au-Lac," Hanoi, 1975, Vietnamese version, pp 37, 35)

What was especially absurd was that for the purpose of proving the existence of the "Van-Lang State," some Vietnamese historians had the effrontery to say that the "An (Yin) bandits" whom the "Van-Lang State" fought against were troops sent by China's Yin dynasty to attack Vietnam. (Phan Huy Le and others: "Several Decisive Strategic Battles in the History of the Vietnamese Nation," Vietnamese version, p 10; see also "General History of Vietnam," p 26) We may well imagine: The Yin dynasty was located in the central plains of China. It was so far away from the "Van-Lang State" that there were no relations whatsoever between the two. What caused a war between them? Under the technical conditions at that time, how could the Yin troops cross the Changjiang River and the mountain ranges and invade the "Van-Lang State"? Who else besides the fabricators would believe in this "invasion"?

Some Vietnamese historians not only went all out to collect myths and legends to fabricate history, but also adopted a capricious, pragmatic attitude toward archaeological finds. For example, they repeatedly said that the Dong-Son culture could "testify" to the existence of the "Van-Lang State." However, the report on the findings of the Dong-Son culture revealed that some copper coins of China's Han dynasty were among the relics unearthed at Dong-Son. This revelation was a far cry from their wishful thinking. Therefore, they arbitrarily repudiated the report under the pretext that "the method of unearthing the relics was not scientific." This resort to deception was indeed appalling!

"National Hero" of Aggression and Expansion

Some Vietnamese historians wildly exaggerated the "military achievements" of the Vietnamese feudal kings and generals in wars with foreign countries, extolling them to the skies and making them more perfect and taller figures than proletarian revolutionaries. An outstanding example is their extolling of Ly Thuong Kiet. They said: "In Vietnamese history, Ly Thuong Kiet proved himself a man of moral integrity and great ability.... Many people were astonished by his achievements in the war against China's Song dynasty." (Van Tan: "In Commemoration of the 900th Anniversary of the Victory of the Battle of Nhu Nguyet Giang: Ly Thuong Kiet and the Cause of Defending and Building the Country During the 11th Century," carried in Vietnam's HISTORICAL RESEARCH, March-April 1977, No 2, p 7) "He was a devoted patriot cherishing a strong desire for national independence. He was also an openhearted statesman and able militarist." They described Ly Thuong Kiet's "war of resistance against foreign aggression" as "a great, earthshaking war of resistance with many unique characteristics in the Vietnamese history of national defense over the past 4,000 years." They even praised a poem by Ly Thuong Kiet as the "first declaration of independence of the Vietnamese nation." ("Several Decisive Strategic Battles in the History of the Vietnamese Nation")

Ly Thuong Kiet was prime minister during the reign of Emperor Nhan-Ton of the Ly dynasty in Vietnam. The Ly dynasty was a rather powerful period in Vietnamese history, whereas the contemporary Song dynasty in China was a period of weakness in Chinese history. The Song dynasty was engaged in internal struggles against the Liao and Jin local governments of minority nationalities in the north and against the Xixia local government in the northwest. Being unable to handle affairs in the south, it adopted an "appeasement" policy toward the Vietnamese Ly dynasty in order to keep everything "peaceful." However, cherishing the ambitions of aggression and expansion, the Ly feudal rulers took advantage of the weakness of the Song dynasty to "match their strength with that of the Song dynasty" and "repeatedly dispatched invading troops to occupy territory." (Zhang Jingxin: "Resistance Against Vietnamese Aggression," Vol 2) Because Vietnam continually sent its troops to invade China and seize Chinese territory by piecemeal encroachment, the local officials of the Song dynasty were compelled to take measures against the Vietnamese invasion. At this juncture, seeing that the Song dynasty was facing many difficulties in carrying out the reform put forward by Wang Anshi, the Vietnamese rulers took the opportunity to launch a large-scale war of aggression against China under the pretext that local Chinese officials were strengthening border defenses.

Ly Thuong Kiet was supreme commander of this war of aggression. During the time from the end of the 8th year to the beginning of the 9th year of the Xining period of the reign of Emperor Shezong of the Song dynasty (1075-1076 A.D.), Emperor Nhan-Ton of the Vietnamese Ly dynasty dispatched a large army led by Ly Thuong Kiet to invade the border areas in China's Guangdong and Guangxi and occupy Qinzhou, Lianzhou and Yongzhou. The invading Vietnamese troops wantonly burned, killed and looted wherever they went. In Yongzhou alone, because a local official, Su Jian, led the people in a dogged resistance, the invading troops commanded by Ly Thuong Kiet perpetrated a massacre, killing "more than 58,000 residents." In Yongzhou, Qinzhou and Lianzhou, they "killed more than 100,000 people," "retreated but took with them captives from these three places" and caused great damage. ("Complete History of Great Vietnam: Biographies of Emperors," Vol 3; "Outlines of Vietnamese Comprehensive History," Vol 3; and "Continuation of 'Zi Zhi Chronological History of China,'" Vol 272) The invading army led by Ly Thuong Kiet openly interfered with our country's internal affairs by opposing the reform carried out by Wang Anshi. In every city or township which it had invaded, it put up notices stating that the reform would "afflict people with suffering, and our army has come to rescue the people." ("Outlines of Vietnamese Comprehensive History," Vol 3) These deeds of naked aggression against our country and interference in our country's internal affairs were historical facts of Ly Thuong Kiet's "punitive expedition to China during the Song dynasty." However, some Vietnamese historians portrayed Ly Thuong Kiet's invasion of our country as a preemptive strike of "active self-defense" and "a unique creation" by him. ("Several Decisive Strategic Battles in the History of the Vietnamese Nation") What absurd logic!

Owing to Ly Thuong Kiet's invasion, the Song dynasty was compelled to launch a counterattack and send Guo Kui and Zhao Xie to lead an expedition to Vietnam. Therefore, the Song dynasty's counterattack in self-defense was a just war. According to the historical records of China and Vietnam, when the Song army crossed the border and marched to Phu Lang Giang, which was 35 li from the capital, the Vietnamese army could not resist it and "Emperor Nhan-Ton of the Ly dynasty was so daunted that he approached the Song army and negotiated a surrender, in which he conceded the territories of To Mao Chau, Tu Lang Chau, Mon Chau, Lang Chau and Quang Nguyen Chau and returned the captives who had been taken from China." Consequently, "Guo Kui withdrew his troops." ("History of Song Dynasty: Biography of Emperor Shenzong"; "Continuation of 'Zi Zhi Chronological History of China,'" Vol 279; "Complete History of Great Vietnam: Biographies of Emperors," Vol 3) After suffering this defeat, the "Vietnamese lived in peace" and "did not make trouble again, so that it was quiet on China's southern borders for a century thereafter." ("Vietnam" in "General Study of Historical Documents," Vol 330)

Obviously, the Vietnamese feudal ruler at that time had overestimated his strength. He sent an army to invade China but eventually surrendered when the Vietnamese army was defeated by the Chinese army's counterattack. However, this battle was exaggerated by some Vietnamese historians as a "decisive strategic battle" of resistance against China's "invasion," and called it "a battle of great victory at Nhu Nguyet Giang." Based on the single sentence "Ly Thuong Kiet put up defensive works along the river" carried in volume three of "Complete History of Great Vietnam," they set up for Ly Thuong Kiet, who lived during the 11th century, a rather modernized "defense line at Nhu Nguyet Giang" and drew a "sketch of the situation of the Nhu Nguyet Giang counterattack." They also described the troop dispositions and movements, the rear services, the joint operations of military and naval units, and the leadership given by the supreme command, and summarized Ly Thuong Kiet's "strategic thinking," and so forth. ("Several Decisive Strategic Battles in the History of the Vietnamese Nation") They displayed nothing but a sandtable illustrating the military operations of the National Defense Ministry of the Le Duan clique against China. What sort of "historical works" these were!

Ly Thuong Kiet, who was an aggressor, was disguised by some Vietnamese historians as a "national hero." Was this not an attempt to call up the soul of a deceased person to serve the Vietnamese authorities' policy of aggression and expansion?

True Features of the Theory That "Vietnam Does Not Have a History of Aggression"

Some Vietnamese historians said nothing about the aggression and expansion of the Vietnamese feudal rulers against neighboring countries. They tried in every possible way to defend and exonerate the feudal rulers and describe Vietnam's aggression against Kampuchea and Laos as "special friendship." According to them, Vietnam was invaded and had never been an invader. This was an out-and-out alteration of history.

An important characteristic of the feudal Vietnamese society was that remnants of serfdom prevailed. Slave labor was widely employed on the large farms owned by bureaucrats and aristocrats. The seizing of slaves was a dominant motive of the Vietnamese feudal aristocrats in going in for aggression and expansion against another country. (Hisanori Wada: "Ancient History of Southeast Asia," chapter 2, section 1) In the past, they not only caused trouble to Chiem-Thanh and other neighboring states but also often intruded into Chinese border areas to kidnap local residents, whom they sold as slaves. ("Major Events During the Song Dynasty: Barbarians"; and "General Study of Historical Documents," Vol 330) Territorial expansion was another motive of the Vietnamese feudal rulers in invading other countries. When the feudal state of Vietnam was founded in the 10th century, its territories included only the middle and lower reaches of the Hong Ha River and the northern part of today's central Vietnam and was equal to one-quarter of today's Vietnamese territories. The other territories were acquired later by encroaching on neighboring countries.

Chiem-Thanh was the state which bore the brunt of the southward aggression and expansion of the Vietnamese feudal rulers. Also called Champa, it was a civilized ancient state different from Vietnam as a nation and in its history and culture. It was founded in the 2d century, much earlier than Vietnam. Its territories lay approximately in the central part of today's

Vietnam. All its territories were gradually annexed by Vietnam through continuous wars of aggression during the period from the middle of the 10th century to the end of the 17th century. The Chiem-Thanh people were culturally developed and ardently loved freedom. After losing their country, some of them preferred to go to remote mountain areas to live with the primitive tribes there than suffer the brutal rule and oppression of the Vietnamese. With regard to the Vietnamese feudal rulers' annexation of Chiem-Thanh, some Vietnamese historians called it a "southward advance." They also described the wiping out of the Chiem-Thanh nation as "taking in a neighboring nation which had a greater enterprising spirit." (Dao Duy Anh: "Vietnamese Territories in Past Ages," Vietnamese version, p 182) They sang the same tune as the old colonialists and imperialists!

Laos is Vietnam's neighbor on the west. In ancient times, it was called Ai-Lao by the Vietnamese. There were many small states and tribes in the territories of Laos before the 14th century. They were the objects of Vietnamese expansion. According to the "Complete History of Great Vietnam," during the 3 centuries and more from the Ly dynasty to the Tran dynasty, Vietnam launched 13 wars on a considerably large scale against Laos. In August 1479, Vietnam dispatched 180,000 troops to invade Laos, capturing and looting its capital Luang Prabang. In December of the same year, it again amassed troops to attack Ban-Man (which is now the Xieng Khouang area in Laos). Cam Cong, chief of Ban-Man, was killed in battle. The Vietnamese aggressor troops destroyed the city of Xieng Khouang by burning it and massacred its residents, causing a famine in the area. "At first, there were 90,000 households in Ban-Man. They were starved. Only some 2,000 households survived." ("History of the Le Dynasty" in "Complete History of Great Vietnam")

At the end of the 17th century, with Vietnam eventually subjugating Chiem-Thanh, Trinh-Lap (Kampuchea) became its neighbor to the south. "Trinh-Lap was Chiem-Thanh's neighbor to the south." (Zhao Rushi: "Laws of the State of Zhenla (Trinh-Lap)" carried in "History of Vassal States," Vol 1) That is to say, the southern part of Vietnam today was Kampuchean territory. During the "period of the Nguyen princes" preceding the Vietnamese Nguyen dynasty, the Nguyen feudal ruling clique gradually nibbled on Kampuchea and by the second half of the 18th century had already annexed half of the Kampuchean territories. After its establishment in 1802, the Nguyen dynasty turned the remaining part of Kampuchea into a "protectorate" under Vietnamese military occupation.

While committing aggression against Kampuchea, the Nguyen dynasty continued its expansion in Laos. It dispatched an army to Laos in 1827 and annexed two-thirds of the Lao territories in more than a year's time, thereby extending Vietnam's western boundaries to across the Truong Son Mountains and further to the Mekong River, with Siam on the other side of the river.

Anti-Chinese Slander Aimed at Altering History

The Le Duan clique regards socialist China as its biggest obstacle in pushing its regional hegemony. Therefore, some Vietnamese historians, using the past to satirize the present, attack China by every possible means and create anti-Chinese public opinion. Ignoring the facts, they deny that the friendly exchanges between the Chinese and Vietnamese peoples were the mainstream in the history of Sino-Vietnamese relations. They exaggerate the contradiction between the Chinese and Vietnamese nations to be the principal contradiction in Vietnamese history. They hold that the contradiction and struggle between the Chinese feudal dynasties on one side and the Vietnamese ruling classes and people on the other side were the main aspects of Vietnamese history. They say that Vietnamese history is a history of continuous struggle against China. With utter absurdity, they regard opposition to China as the most essential motive force in the development of Vietnamese history.

Contradictions and struggles often occurred between slaves and their owners and between peasants and feudal landlords in Vietnam. According to preliminary statistics, peasants revolted on more than 300 occasions during the period of the feudal society in Vietnam. It was precisely the struggle for production and class struggle waged by the peasants that promoted the development of the Vietnamese feudal society and formed the main content of Vietnamese history. However, owing to their eagerness to oppose China, some Vietnamese historians have even ignored this rudimentary historical knowledge.

Taking the development of the history of Sino-Vietnamese relations as a whole, it was undoubtedly the working people, and not the feudal rulers, of China and Vietnam who played the decisive role. In ancient times, China's advanced production skills and cultural knowledge including the Han written language were brought to Vietnam and played a positive role in developing the productive forces in Vietnamese society, wiping out the surviving elements of the primitive society and pushing the feudal society forward. On the other hand, some farm products and fruits such as sweet potato, longan and litchi were brought from Vietnam to China, enriching the lives of the Chinese people. As a result of their long-term contacts, the Chinese and Vietnamese people have some common habits and customs. For example, they observe the same traditional festivals, such as the Spring Festival, the Tomb Festival, the Dragon Boat Festival and the Moon Festival. What especially cannot be forgotten is that the Chinese and Vietnamese people voiced support for each other in their struggles against feudal oppression. During the past century in particular, they sympathized with and supported each other in their common struggle against colonialism and imperialism. In the hard years during the Vietnamese wars against France and the United States, the entire Chinese people gave strong backing to the Vietnamese people, the vast Chinese territories became the reliable rear base of the Vietnamese people, the Chinese people aided the Vietnamese people in many ways, and the struggle of the Vietnamese people also aided the Chinese people. The revolutionary friendship of the Chinese and Vietnamese people was indeed cemented with blood.

With regard to the wars launched by the Chinese feudal rulers against foreign countries, it must be admitted that since ancient times, China has been a united, multinational country with a large population and vast territories. Contradictions between nationalities and classes were very acute and complicated. The peasant uprisings and peasant wars in feudal Chinese society had few parallels in frequency and scale in world history. The resistance put up and struggles launched by the people of various nationalities tied the feudal rulers' hands, preventing them from engaging in foreign aggression and expansion. This was also true of China's relations with Vietnam in ancient times.

In the long history of contacts between China and Vietnam, real wars between the two countries were very short in duration and occurred only occasionally. Compared with the historical mainstream of friendly contacts between the Chinese and Vietnamese peoples, they were just like a few small tributaries. For almost all the time, the Chinese and Vietnamese people maintained friendly contacts and got along well with each other.

We respect historical facts. We do not deny that some Chinese feudal rulers launched wars of aggression against Vietnam; neither do we defend them. Historical research should not be separated from concrete historical conditions. The Chinese people at that time were powerless because they were oppressed by feudal rulers. The Chinese feudal rulers launched wars of aggression against Vietnam and drove large groups of soldiers and workmen to "brave the heat of the sun and the attack of miasma" and to die for them. Fundamentally, this ran counter to the wishes and interests of the Chinese people. The Chinese people were against it. Therefore, the Chinese people at that time should not be held responsible for this; nor should the Chinese people today be required to take historical responsibility for what the feudal rulers did. Similarly, the Vietnamese people should not be held responsible for the foreign aggression and expansion launched by the Vietnamese feudal rulers in the past. However, some Vietnamese historians do not like this. They try to seize on the launching of wars against Vietnam by Chinese feudal rulers and make an issue of it. They want the Chinese people today to pay the debts of the past feudal rulers. In this way, they can create a historical basis for the Vietnamese authorities' policy of opposing and hating China.

From the several points mentioned above, we can see that with the Le Duan clique embarking on the road of political degeneration, historiography in Vietnam today has degenerated into false historiography serving regional hegemonism.

IT IS NECESSARY TO PAY SIMULTANEOUS ATTENTION TO PLANTING AND PROTECTING TREES

Beijing RED FLAG in Chinese No 7, 1 Apr 82 inside back cover

[Article by Li Mingfu [2621 2494 4395]]

[Text] "The Resolution on Unfolding an All-People Voluntary Tree-Planting Movement" adopted by the 4th Session of the 5th NPC points out: "Planting trees everywhere in the country is a great cause for building socialism and for benefiting future generations, and is a major strategic measure for regulating mountains and rivers and protecting and improving the ecologic environment." In recent years, the broad masses of cadres and people have realized, to a certain extent, the significance of planting trees and carrying out afforestation. Every year a great deal of manpower and financial resources are spent on this task. The current problem lies in the fact that a large number of trees have been planted, but only a small number of them survive. As the masses summed up, no trees can be seen after planting trees and no forests can be formed although afforestation has been carried out. Luannan County in Tangshan Prefecture, where a good job of planting trees was done, is an example. There, 2.68 million trees were planted in 1977, 1.34 million of which survived, giving a survival rate of 50 percent; 1.5 million trees were planted in 1978, 820,000 of which survived, giving a survival rate of 54.7 percent; 1.82 million trees were planted in 1979, 690,000 of which survived, giving a survival rate of 37.9 percent; 2.34 million trees were planted in 1980, 710,000 of which survived, giving a survival rate of 30.3 percent; 1.66 million trees were planted in 1981, 659,000 of which survived, giving a survival rate of 39.7 percent. A total number of 10 million trees have been planted in the last 5 years in this county, 4.219 million of which have survived, giving a survival rate of 42.2 percent. Besides the low survival rate, the conservation rate and the rate of growth into useful timber were even lower. This mainly resulted from the tendency of laying stress on planting trees but neglecting tree protection. The neglect to tend trees can be found in the following three aspects: 1) Owing to the view of putting completion of assignments above everything else, some localities are only concerned about the number of trees planted and disregard the survival of these trees. 2) Perfected measures are not taken to protect trees. The seedlings are eaten by pigs and goats, but no one assumes responsibility. 3) The responsibility system in forestry production has not been established in many localities and the forestry policies have not been put into effect. The initiative of the masses in planting trees has not been aroused. Unless the above problems are solved, forestry production can never be rapidly developed.

Practice in many localities shows that, as in developing agricultural production, success in planting trees and conducting afforestation must rely on implementing correct policies and making use of science. In order to do a good job of planting trees and carrying out afforestation, to effectively raise the rates of survival, conservation and timber formation and to realize the goal of making the land of our country green, we should, first of all, take further steps to implement the forestry policies that trees planted by the state are owned by the state, those planted by communes or production teams are owned respectively by them, and those planted in common are owned in common. The trees planted by commune members around their houses or at places designated by production teams should always be owned by individual members. Wherever the policies of fixing farm output quotas for each household and assigning the households full responsibility for task completion are implemented, those scattered trees and forest belts near farm fields formerly owned by collectives can all be contracted to households or individuals. No matter what kind of production responsibility system is adopted, the ownership of trees cannot be changed, tree farms and seedling nurseries owned by communes or production teams cannot be broken up or weakened.

Second, various forms of the responsibility system in forestry production should be conscientiously implemented. Attention should be paid to local special conditions and the responsibility system should take a form that most of the masses are willing to accept. It is necessary to contract out the existing forests owned by collectives, particularly forests stretching over a wide area and backbone forests, to full-time personnel specially assigned to protect trees. Small areas of scattered trees and forests can be contracted out by fixing a price for households or individuals. Measures can be taken to preserve the value of forests, to fairly dividing benefits in proportion to the increase in value. In the future, trees can be planted in a unified plan, afforestation work can be divided and assigned to each household. While leaving the ownership of forests with production teams, responsibility for forest management should be assigned to individuals, with profits shared by the production team and the individual. It is imperative to lay emphasis on the quality of planting trees. Survival should be actually guaranteed as a part of the assignments for planting trees.

Third, perfected organizations should be established and scientific measures should be taken for protecting forests and planting trees. The past experience and lessons whereby a large number of trees were planted, but only a small number survived, and an even smaller number grew into forests with useful timber, should be conscientiously summed up. Great efforts should be made to carry out afforestation scientifically and to take good care of forests. In particular, we should do a good job in selecting tree strains suited to the land, nursing good and strong seedlings, preparing the soil with sufficient base of fertilizer, planting trees carefully and in rational density, and tending and protecting trees for a long time. Organizations for tending forests should be established and perfected in places where such organizations do not exist. Systems of rewards and penalties should be laid down on a feasible basis, so as to fully arouse the initiative of the personnel in charge of tending and protecting forests and to actually guarantee the survival and growth of trees. At the same time, rewards should be granted to people who plant a large number of trees with high rates of survival, conservation and timber-formation.

Fourth, in the future, while counting numbers of trees planted, the departments concerned should pay more attention to counting the number of trees that survive. Assignments in tree planting and methods of rewards and penalties should take the number that survive as the standard.

ON QUESTIONS REGARDING OUR COUNTRY'S ECONOMIC RELATIONS WITH FOREIGN COUNTRIES

Beijing RED FLAG in Chinese No 8, 16 Apr 82 pp 2-10

[Article by Editorial Department]

[Text] In order to open up new prospects for developing China's foreign economic relations in an all-round manner, we should sum up both the positive and the negative of our past and present experiences on a series of basic problems related to our foreign economic relations and thus more clearly understand and more satisfactorily carry out the CCP Central Committee's correct principles and policies.

I. What Exactly Is the Nature of Foreign Economic Relations?

A few years ago, Comrade Deng Xiaoping pointed out that the external economic work is a strategic issue that has a bearing on the success and failure of our four modernizations. This is absolutely true.

In the "introduction" to Marx' well-known "Manuscripts on Economics (1857-1858)," he pointed out the necessity of studying "the international relations in production" after he had expounded on the various sectors in social production and their relations. He was also of the opinion that we had to treat international relations in production as a special subject of study in economics. This subject had to include "international division of labor," "international exchange," "import and export," "exchange rates" and other themes. This is a view of great significance. By raising this view, Marx pointed out, briefly and succinctly, that in the modern world, economic problems are by no means phenomena that are related only to domestic factors; on the contrary they must be studied in the context of international relations and should not be studied in isolation from international relations. We should never neglect this important view of Marx' in discussing China's foreign economic relations.

Almost all the countries in the present world, with perhaps very few exceptions, attach great importance to the problem of external economic relations. Many countries and areas, such as Japan, Singapore and Hong Kong, even regard it as a vital one. As far back as more than 100 years ago, Marx and Engels pointed out that along with the emergence of the international market, the nations of the world have become increasingly economically related and dependent on one another and the closed-door and self-sufficient situation are gradually becoming things of the past. During the past decades, especially since World War II, this situation has been further developed in an unprecedented manner. This is a fundamental historical task as well as an inevitable trend of social development. We should never be ignorant of this fact in regarding China's foreign economic relations today.

Since the founding of the PRC, we have undergone many twists and turns in developing our foreign economic relations and have failed to make any substantial progress in this respect. Of course, we are not to blame for this on the grounds that we preferred a policy of closing our country to international exchanges. At that time there were other reasons: First, the major capitalist countries in the world headed by the United States adopted an antagonistic attitude toward us and blockaded us for a long time. They put an embargo on many commodities. Second, since the beginning of the 1960's, when the Soviet Union tore up its economic contracts with us, our economic relations with the Soviet Union and a few other countries have been greatly reduced. Third, for a time, especially during the period of the "Great Cultural Revolution," our policy of self-reliance was greatly distorted. Self-reliance is an absolutely correct policy, but it is absolutely wrong to distort this policy and set it against the development of external economic relations.

Since the time around 1972, there has been a change in our foreign economic relations and we have gradually opened up some prospects. However, it was not until the smashing of the "gang of four" and especially not until the 3d Plenary Session of the 11th CCP Central Committee that it was made clear throughout the party that we should develop our foreign economic relations. This is indeed a very farsighted policy decision. Then, from 1978 to 1980 we actually brought about a great change to and made great progress in our foreign economic relations. At the same time, we also committed some errors in this respect. This has taught us that we should sum up our experience and make the pace of our progress steadier. However, we should not, for this reason, get the wrong idea and think that we should retreat and dare not continue to actively develop our foreign economic relations. Summing up experience is aimed at developing the foreign economic relations of this socialist country more satisfactorily. Otherwise, we will be going against the principle of the third plenary session of the Central Committee.

The party Central Committee recently noted that to promote our socialist modernization program, we must use two types of resources, that is, domestic resources and international resources; we must develop both our domestic market and our place in the world market; and we must master two skills, that of domestic construction management and that of developing foreign economic relations. This has further defined the strategic position of our foreign economic relations. According to this point of view we should continue to vigorously widen our field of vision and raise our understanding on the problem of developing our foreign economic relations. After the October Revolution, Lenin advocated the implementation of the concession system. At that time, since the Soviet Union was in great difficulties, the enterprises under the concession system amounted to more than 200 and tens of millions of rubles of foreign capital was drawn into the Soviet Union. At that time, Lenin was of the opinion that associating the Soviet Union with international capital was necessary. At the same time, he thought that there was a serious struggle in the course of associating with international capital and associating with international capital was aimed at promoting the socialist economic construction of the Soviet state. Today, we are continuing to act in accordance with Lenin's viewpoint. It is wrong to close the country to international exchange, to fight in isolation or to refuse to be associated with international capital. On the other hand, it is also wrong to neglect or abandon struggles during the process of associating with international capital. To put it in a nutshell, we should struggle while associating. At present, we must pay attention to summing up experience, formulate a whole set of correct guiding principles, policies and measures by thinking over carefully and continuing to make great efforts, and open up a path for developing our country's foreign economic relations that is suited to both national and international conditions. Only by so doing can we really and effectively overcome all kinds of conservative ideas that uphold sticking to old ways and can we overcome blindness and spontaneity in our action. Only by so doing can we open up new possibilities and take the initiative in our own hands.

II. Why Is It That the Development of Foreign Economic Relations Is an Important Strategic Question in Our Modernization Program?

In essence, this is a question of how to soberly understand the problem of in what historical conditions, what national conditions and what favorable and unfavorable conditions we are carrying out our modernization program.

We have the following four favorable conditions:

First, except in Taiwan, we have already soundly established the socialist political and economic system throughout our country. We have transformed the private ownership of the means of production into public ownership and the members of the exploited class into laborers who support themselves by their own labor. We have also placed the lifelines of our national economy in the hands of our state on behalf of the working class and on behalf of the whole laboring people.

Second, we have already corrected our guiding ideology and started to formulate a line and a complete set of principles and policies for carrying out the four modernizations program, and we have already formed a strong and resolute CCP Central Committee that is competent to correctly lead the four modernizations.

Third, with our strong national defense forces, we are strong enough to defend the peaceful construction of our people. At the same time, owing to our correct foreign policies, we enjoy high political prestige in the world.

Fourth, there are very favorable international conditions for our concentrating on carrying out our modernization program. Already, 174 states and areas have started trading and are developing their trade and economic relations with us.

We have the following four unfavorable conditions:

First, though we already have some technical strength which is already up to advanced world standards in some respects, on the whole, our equipment, technology, technical personnel, management and administrative standards are backward and lag behind the world advanced standards to a fairly large degree.

Second, although we already have a considerably sound material basis and are able to accumulate some funds every year, our sources of funds are, after all, limited. The amount of funds raised within our country falls short of the demands of construction.

Third, our rich natural resources are indeed a favorable condition, but many of these resources still remain unexploited underground. Therefore, this is only a latent favorable condition instead of a realized favorable condition.

Fourth, our excessive population is a heavy burden on our country. Though it constitutes a rich resource of manpower, we lack the means to utilize this. Of course, if our manpower is fully utilized, it will change from being a burden into being an advantage.

The above-mentioned favorable and unfavorable conditions are what we should proceed from in considering the problems concerning China's economy today, including those of foreign economic relations. It is precisely because we proceed from these historical conditions that we uphold the view that we must work hard and perseveringly, rely on our own strength, maintain independence and keep the initiative in our own hands while promoting our socialist modernizations program. We must not, in the slightest degree, deviate from these principles. The modernization cause of a big country with a population of 1 billion should and can only be carried out by relying on the country's own strength. However, on the other hand, it is also because we proceed from these historical conditions that we uphold that we should not distort self-reliance and regard closing our country to international exchange and fighting in isolation as self-reliance. We must expand our field of vision from our country to the world on the basis of self-reliance. We must not only go all out to make use of all positive factors within our country, but should also go all out to make use of all foreign factors that can be used by us. This means, in fact, using the strong points of all the countries in the world to offset our weakness. Using the phrase in the book "Guan Zi," this means "taking all the valuable things in the world for our use." Only in this way can we develop our national industries as quickly as possible through foreign economic relations and by drawing support from foreign capital and advanced technology. Only in this way can we more smoothly overcome the difficulties facing us and quicken the pace of promoting our socialist modernization program. Precisely in this sense lies the strategic significance that we attach to our foreign economic relations.

On the problem of foreign relations, we can draw quite a large number of experiences and lessons from the history of modern China. In our history, there were two kinds of people. One kind of people worshipped and had blind faith in foreign things and was subservient to foreigners. As a result these people humiliated the nation and forfeited its sovereignty. Whether the Empress Dowager Cixi, Yuan Shikai or Chiang Kai-shek, they were, without exception, cast aside by the people. The other kind of people upheld closing the country to international exchange and adopted an arrogant attitude toward other countries. Thus these people were satisfied to lag behind and finally became castaways in history. Were not the diehards at the end of the Qing dynasty, who regarded China as the "Heavenly Kingdom" and treated all foreign countries as "uncivilized nations" that should be put under the suzerainty of China, this kind of people? Under the present new historical situations, the above-mentioned two tendencies are still to some extent reflected in the minds of some of our party members and cadres. This may perhaps be regarded as a kind of historical legacy. Some people feel ashamed before foreigners and think that everything is good in other countries, and bad in ours. Others are very apprehensive about opening up to the outside world and are of the opinion that there will not be peace and security if we open up and that if we must open up, we must open up as little as possible. The two tendencies have a common point and that is their lack of confidence in the fact that today we, as a developing great socialist country, are able to open up new prospects in developing our foreign relations.

Our comrades, especially all those who are engaging in external activities including external economic activities, must have a profound understanding of the strategic significance of our foreign relations, especially the strategic significance of our foreign economic relations. They must be both brave and adept in plunging into the vast world to open up new prospects. At the same time, they must also carefully pay attention to understanding the extremely complex nature of the environment we face as a result of opening up to the outside world, be both brave and adept in learning new skills and abilities, prevent and overcome various kinds of negative practices, adhere to the principle of socialism and persistently safeguard the purity of communism. We must do all the above-mentioned things without the smallest omission. Otherwise we will be committing a great error which will cause great harm to our cause. This is an indispensably important factor in ensuring the healthy development of our external work and the victory of our construction cause.

III. The Necessity of Having a Whole Set of Correct Guiding Principles and Policies on Foreign Relations

This means that we should not do our work at random or deal with only those problems that have cropped up. Instead, we should have a complete set of plans with scientific foresight. For this purpose, we should really have a good grasp of the major issues and characteristics of our foreign economic relations.

What are the characteristics of our foreign economic relations?

First, dealing with foreign businessmen is different from dealing with people in our country. In dealing with the people in our country we can enforce discipline and even force people to observe the discipline if necessary. However, in dealing with foreign businessmen, we cannot act in this manner, and should pay attention to maintaining our good reputation. In discussing contracts and agreements, we must deal with the foreign businessmen on the basis of equality, mutual benefits and voluntariness. In view of this, we should both be strict in enforcing discipline at home and be flexible externally.

Second, foreign economic relations often involve many departments and fields. Some of the problems they involve even affect the whole economy and social life of our country. In view of this, our localities, departments and units should not act independently in conducting their foreign economic activities and thus leave loopholes for foreign businessmen to exploit and enable them to make excessive profits at our expense. Instead, we should carry out our external economic activities under unified leadership and comprehensive planning. Only under such a premise can we give better play to the initiative of all the parties concerned.

Third, we should make a distinction between two kinds of foreign businessmen. With regard to those foreign businessmen who show their good faith in cooperation and do business in a proper way, we will take a welcoming and polite attitude, pay attention to maintaining a friendly relationship with them and implement the policy of equality and mutual benefit, no matter whether we will be able to do business and come to terms with them. As for those foreign businessmen who have ulterior motives, adopt improper measures, go so far as to adopt measures that violate our country's sovereignty, and go in for swindling, bribing, smuggling, infiltration or even espionage activities that impair the rights and interests of the Chinese people and corrupt our cadres and citizens, they will certainly meet with firm resistance from the Chinese people and some will be prosecuted in accordance with China's laws. All our party members, cadres and citizens who depart from the correct stand in these unlawful activities and who have been corrupted by such foreign businessmen must naturally be criticized and administratively, or even judicially, punished.

In short, the above-mentioned characteristics mean unified leadership, comprehensive planning, flexible response, strict discipline, making distinctions and adherence to principles. These things must be conscientiously observed as a general principle in our work.

However varied our foreign economic relations are, they can be summarized as exportation and importation. These two aspects interact and are dependent and conditional on one another. Therefore, the key issue in handling foreign economic relations is to correctly handle the relationships between these two aspects and dialectically harmonize them.

Focusing on this key issue, we have to study the following six problems: First, how to attract foreign capital; second, how to correctly introduce advanced science and technology from abroad; third, how to vigorously develop international cooperation in exploiting manpower; fourth, how to energetically market our products in the world; fifth, how to provide economic aid to other countries in accordance with our capability; and sixth, how to correctly handle the relationships between political and economic aspects in our external relations. As long as we have a clear understanding of these six problems and adopt correct policies and vigorous measures to solve them, we will surely be able to continuously make progress in developing our foreign economic relations year by year, and we will surely be able to give increasingly full play to the role of foreign economic relations in promoting our construction at home.

IV. How Should We Attract Foreign Capital?

This is a prominent problem in handling our foreign economic relations at present. It is a problem which we urgently need to solve but which we have as yet failed to solve.

Attracting capital from capitalist countries and areas in accordance with the practical needs and capabilities of our country is a new task that we have never tackled before. That is why this problem is especially important today.

At present we usually adopt the following three methods in attracting foreign capital: First, attracting direct investment in joint ventures, joint management, joint exploitation, compensation trade, processing and assembling; second, striving to obtain long- or medium-term loans at medium or low interest rates from foreign governments and international financial organizations and all kinds of development funds and relief funds; and third, obtaining ordinary commercial loans. At present, attracting direct investment has become the most important method for China to utilize foreign capital. This method has two advantages, namely, that of granting the investor direct interest in what they invest in and that of enabling us to better learn from the advanced technology and management abroad. The successful experiences in many countries have proved that these kinds of joint venture and joint management enterprises themselves constitute economic and technical training courses.

In order to effectively attract direct investment, we should have a set of clear and definite correct policies. First, we must grasp all the large, medium-sized and small projects at once while regarding medium-sized and small ones as the main factor. This is the way to get quick results. Second, we should welcome all capitalists from abroad, including foreign and Overseas Chinese capitalists and those from Hong Kong, Macao and Taiwan. And third, we should to a certain extent relax our policy and allow these capitalists to make profits. If we do not allow them to make money, we will not be able to attract them and we will not be able to open up any possibilities. We will not be able to keep up with the times if we do not act bravely and wisely.

It is imperative to be prudent in using ordinary commercial loans. Since they are loans, we have to repay the principal and the interest. Moreover, the loans should be used in combination with domestic investment to form complete sets of investment. Thus there will inevitably be limitations in our utilization of foreign commercial loans. As for long- and medium-term loans at medium or low interest rates, though we can feel more at ease in utilizing them, their availability is limited. A capitalist is, after all, a capitalist. As long as he is a capitalist, he will always be pursuing excessive profits. We should be especially careful in drawing lessons from the countries that are heavily in debt.

In short, in order to emancipate people's minds, we should sum up our experiences in a timely way and carefully foster model units. The experience in a successful model unit will facilitate the progress in all similar units. Thus we will be able to open up broad prospects step by step.

V. How Are We To Correctly Import Advanced Science and Technology?

There are many ways to introduce advanced science and technology from abroad and we should not restrict ourselves to a few ways. We have five kinds of things to import in this respect: advanced equipment or components; new and fine-quality materials; new principles, data, and know-how; new skills and scientific rules of operations; and advanced management methods.

In importing equipment, we have committed some errors, but we have to make a realistic analysis of these errors. Importing a few complete sets of equipment was necessary not only in the past, but also is necessary now and will be necessary in the future. Our errors in the past were mainly in the following four respects: importing an excessive number of complete sets of equipment; importing the same equipment more than once; importing equipment without importing the technical information to operate the equipment; and failing to study the technology of the imported equipment so as to understand it and popularize it. Having learned lessons from the above-mentioned errors, we will be able to gradually improve our work in this respect in the future.

Regarding the problem of importing new and fine-quality materials, we should first of all make efforts to produce these materials ourselves. We should encourage our specialists and technicians and organize them into key task teams to plunge into production practice, grasp the new production technology, increase the varieties of our products and expand the scale of our production, and thus win glory for our country. However, we should also fully reckon on a long-term policy of importing various kinds of raw materials, especially new and fine-quality materials that are necessary for our construction. In order to grasp all kinds of new technology, all countries in the world have to do so, including the developed ones such as the United States, Japan and West Germany.

Regarding introducing advanced science, technology and management from abroad, we should admit that we have failed to make sufficiently great efforts to learn soundly and modestly from abroad. Now we should further encourage our broad ranks of cadres, intellectuals and workers to have the high aspirations of the Chinese people and turn the slogan of studying science to become more capable and learning from experts into action. We should strive to create a social mood of working and studying hard for the prosperity of our country among all our party members, among the broad ranks of our cadres, intellectuals and workers, and even among all the people throughout our society and nation. This is a task of vital importance.

In introducing advanced science and technology from abroad we should also pay attention to the following two problems:

The first problem is that from now on, we must no longer import consumer goods. Except under unified state arrangements, no departments or localities are allowed to import consumer goods without authorization. The practices of some departments and localities that are importing consumer goods without permission are, in fact, very harmful and shameful activities that impair our national industry. It is an important principle that we must pay close attention to protecting our national industry. We must make the widest possible use of those daily consumer goods that can be made and supplied by domestic units. We should vigorously encourage and develop the spirit of Comrade Zhou Enlai in refusing to wear any watches other than those that are made in China. Only by encouraging our broad masses of people, and above all our party members and cadres, to use Chinese-made consumer goods can we protect our national industry and ensure its smooth development.

The other problem is that we must do a good job in managing foreign exchange in all our central departments and in all the localities under the unified leadership of the state. We must use our foreign exchange where it is needed most. This means that we should use it for the technical reform and the renewal of our industrial equipment. We should use it to import advanced equipment and components that are necessary to develop new lines of industrial production, new and fine-quality materials that are in short supply in our country and that are urgently needed for processing goods for export, certain agricultural means of production that our country cannot supply and that are urgently needed in developing agriculture, and certain kinds of consumer goods that our country indeed cannot supply and that are indeed indispensable in the life of our people. Are we not acting against the interests of our state and people if we waste the limited amount of our hard earned foreign exchange in importing unnecessary consumer goods instead of in importing equipment, technology and raw materials that we urgently need for expanded production and for earning a larger amount of foreign exchange?

VI. How Are We To Energetically Promote Our Business of International Labor Cooperation?

An excessive population is a great problem facing us. On the other hand, our abundant labor force is our country's greatest advantage. We not only have a large amount of surplus labor in our countryside, but also some surplus labor in our state-owned factories and mines. Moreover, every year a large number of people enters the labor force. Therefore the total amount of our surplus labor is very large. If we take the total number of surplus laborers as 100 million and suppose that every laborer is able to produce 500 yuan of products, the total value of their products will be 50 billion yuan a year. The problem now is not that these laborers lack initiative in their work but that they have no opportunities to play their roles. In order to find a way out, we should strengthen our organizational work, open up as many possibilities as possible and be good at giving guidance. As far as we can foresee, in a fairly long period to come, we should first speed up the development of the diversified economy in our countryside and open up as many possibilities in the cities to provide more job opportunities. By so doing we will be able to employ a large amount of the labor force and can, moreover, organize it to produce goods for export. At the same time, we should find employment for them throughout the world and conscientiously develop international labor cooperation.

Our business of international labor cooperation has just begun. In 1981, we sent over 17,000 laborers abroad to work on contracts. This number was too small compared with our potential in this respect, compared with the demand for such labor abroad and compared with the numbers of laborers that other developing countries have sent abroad. Our construction undertakings have shown a sharp competitive edge in contracting for construction projects in the world market and these projects will in turn promote the export of our building materials. From the above we can see that there are bright prospects in developing international labor cooperation.

Labor cooperation is not restricted to contracting for construction projects abroad. It can also be developed in the following three ways: processing materials from foreign businessmen and processing in accordance with the samples or drawings from foreign businessmen; establishing all kinds of enterprises in foreign countries; and energetically developing tourism. It is said by some foreigners that the pottery figurines of soldiers and horses at Lintong are one of the eight wonders in the world and as a result 50,000 foreigners went there to see them last year. We have to improve our tourist facilities and nationally fix the prices of the goods that we sell to tourists in order to increase our sales by narrowing the profit margins. By so doing we will benefit by opening up of more job opportunities and earning more foreign exchange.

It seems that for a long time to come, our manpower will continue to be the most competitive thing we have in the world market. We should give guidance to the cities and provinces along our coastline in vigorously developing the processing of materials provided by foreign businessmen. But we must pay attention to exporting all the finished goods of our processing undertakings and should not allow them to enter the domestic market. Otherwise, the processing undertakings will facilitate the import of foreign goods.

VII. How Are We To Bring Chinese Products Into the World Market on a Still Larger Scale?

China's current export trade is conducted on a too narrow and small scale. We have nearly one-fourth of the world's population, but our share of the world market is less than 1 percent, 0.9 percent to be more exact, which ranks 28th in the world. Of course, in recent years we have to some extent improved our work and have made relatively great progress in this respect, but we should not exaggerate our successes.

There are both objective historical and subjective reasons why the scale of our exports has remained so small for more than 30 years. We should certainly not reproach ourselves too severely for our subjective errors, but we must soberly understand this fact and strive to achieve a relatively great development of our export trade within a short period of time.

Regarding the relationships between exports and imports, there is also the problem of breaking through the old conventions and opening up a new situation.

Generally speaking, exports are the basis of our foreign trade. It will never do if we conduct our foreign trade in the manner of importing only without exporting any goods. We have always been particular about striking some important balances, including the balance of international receipts and payments. However, does this mean that in arranging our export and import business that our imports should be restricted by the value of exports and should not exceed our exports every year? No, this is not a good way of putting it. Regarding this question, we should make all-round arrangements by considering the whole situation, and we should correctly understand and handle the dialectical relationships between exports and imports. That we can only import after we have exported some of our goods and obtained some foreign exchange to pay for our imports is only one aspect of the question. We should see another aspect of the question, namely, our imports can in turn promote our exports. For example, when we lack materials for producing goods for export, we have to import the materials and then process and turn them into goods for export. Only by so doing can we promote our exports. Another example is that by introducing equipment and technology to increase the output and improve the quality of our products, we will be able to make them more competitive in the world market. Thus imports will also promote our exports. These arguments have long been fully proved by the successful experiences in Japan and many other countries and areas. Could these countries and areas have survived if they had restricted the volume of their imports to that of their exports? Therefore, promoting imports by developing exports and promoting exports by developing imports is a kind of dialectical relationship. This relationship can only be rationally balanced and reasonably handled in the course of time, perhaps 1 or 2 years.

What policies should we adopt and in what direction should we strive to increase the export of our products? To answer this question, we have to sum up the experiences in our history. In the past, the export of some kinds of our products relied, to a great extent, on reducing their supply in our domestic market. This was a natural practice during the 1950's because we had very few things to export at that time and could not avoid doing this. However, it is wrong to continue to do so now. Certainly, we can reduce the supply of some high-grade goods and agricultural and sideline products at home in order to export these goods. But even in doing this we should not go too far and we should not base our hopes for increasing exports on this. Otherwise we will bring about an acute shortage of consumer goods in our domestic market, and thus we will not only force our people to reduce their consumption but also make it impossible for the processing undertakings in our country to develop smoothly. Moreover, a shortage of goods at home will impair our people's initiative and will encourage speculative activities in our domestic market. Perhaps some people will say that the United States is also exporting a large amount of agricultural products. This shows that these comrades do not understand the essence of the problem. Agricultural production in the United States has already been carried out in the manner of industrial production, and this is completely different from the agricultural production in the countries of the Third World. The extensive export of agricultural products by the United States is in essence an action to dump its surplus industrial products. On the other hand, when the Third World countries sell agricultural products to developed capitalist countries in exchange for their industrial consumer goods, they suffer the exploitation of the rich countries because of the unequal exchange. We should not follow the path of these Third World countries or we will commit mistakes.

What should we do in accordance with a correct policy? According to our historical and current experiences, we should strive to make progress in the following four directions:

First, energetically increasing our export of mineral products and vigorously developing our export of nonferrous and rare metals. In the past, there was an argument that strategic materials should not be exported. This view has long been outdated. We should emancipate our minds in understanding this problem. Of course, we should arrange our export of these materials in a planned manner and strive to get the most favorable terms in trading them.

Second, conscientiously increasing our export of mechanical and electrical products. In the past few years, we have made relatively rapid progress in this respect, but there is still great potential to tap. We should mobilize the millions of staff and workers in our engineering industry and encourage them to raise the quality of their products and improve their technology in order to enable their products to enter the world market and win prestige for their motherland.

Third, further developing the export of light industrial products, textiles, various arts and crafts articles such as chinaware, cross-stitch work, Chinese medicines, clothes, embroidery products and carvings.

Fourth, developing the export of our special local products such as tea, Chinese medicinal materials, livestock products, natural products and preserved fruits.

Of course, if necessary, we will have to reduce, to an appropriate extent, the domestic supply of some daily consumer goods that are in short supply both at home and abroad and that are much needed in the livelihood of our people in order to increase their export.

We should adopt a series of policies and measures in order to develop our export trade. For example, we should adopt proper policies in support of the development of our export trade, including going out to establish marketing and servicing networks, making increased efforts to improve the prestige of our products, pay attention to product quality, pay attention to honoring agreements, solving transportation problems and port problems, and bringing into full play the initiative of all departments and areas.

VIII. How Are We To Correctly Support the Third World?

Offering support to the peoples of all Third World countries in their just struggles to defend their national independence, develop their national economies and oppose imperialism, colonialism and hegemonism is China's international duty which it cannot shirk. Over the past 30 years and more, China has done a lot of work in such aspects and played an important active role in handling international affairs.

Most of the Third World countries are countries friendly with us and are enthusiastic in opposing imperialism, colonialism and hegemonism. However, their social and political systems and level of economic development differ widely. Regarding the level of economic development of these countries, most of them are poor or the poorest countries in the world and only a small number of them are rich. In terms of per capita average national product, the United Arab Emirates, Qatar and Kuwait rank as the top three in the world, but they are Third World countries. There are also quite a few Third World countries that are much richer than our country. Owing to the abovementioned complicated situation, in carrying out our policies of supporting Third World countries including the policy of giving them economic aid and promoting our economic contacts with them, we should make a clear distinction of their different economic statuses and act accordingly.

One of the facts at present which cannot be ignored is that many of the Third World countries are carrying out their economic construction on a fairly large scale. This is the case in many countries in Latin America, Africa, the Middle and Near East, the Gulf area and Southeast Asia. There are bright prospects for our economic cooperation with them.

On the other hand, we should extend by every possible means material aid to those poverty-stricken countries which are in difficulty and which are subject to external aggression and threats.

Our comrades must understand that supporting the Third World countries is an issue of strategic significance and we should never neglect this issue. Now many Third World countries hope that we will help them in their development. They say that some of the First World and Second World countries have set up factories in their countries to bully them and some are even carrying out subversive activities there. These countries have also expressed their confidence in China. It is reported that in the past few years, India has achieved good results in setting up joint venture enterprises abroad--mainly in other Third World countries. In 1981, the number of such joint venture enterprises was more than 400 and these enterprises were located in more than 40 countries in the world, of which more than 90 percent were in Southeast Asia, South Asia, the Middle East and Africa. We should also do our best to do something along these lines.

IX. We Should Correctly Understand Political and Economic Relations

In order to develop our foreign economic activities well, we should break with some old conventions and set to right the relationships between politics and the economy.

For a long time, we upheld the argument that economics must be subordinated to politics. This argument is partly right but it fails to take every aspect of the problem into account. One of the basic viewpoints of Marxism-Leninism is that economics and politics influence and act on one another but in the final analysis, politics is decided by economics. This is also true in handling the issue of foreign relations. If foreign economic relations are developed in a satisfactory manner, it will facilitate the continuous development of political diplomatic relations. On the contrary, if we fail to open up the prospects for developing foreign economic relations, the development of political relations with foreign countries will inevitably be obstructed and will never be able to be vigorous. The reason why many countries carry out their economic transactions with one another despite bitter political antagonism lies in the demand resulting from their economic interests. Not only the capitalist countries but all countries have to take into account their major economic interests in deciding their political policies. This is a common phenomenon in the world.

In handling the relationships between politics and economics, we should stress that stringent efforts should be made to master advanced science, culture and management methods from other countries, but as for the influence of corrupt bourgeois ideas, we should resolutely oppose them. At present, some people are adopting a diametrically different attitude. They do not work hard to learn from the really advanced things abroad and even completely neglect the study. On the other hand, they treasure the most degenerate and the most evil things from capitalist countries and allow them to become all the rage. We have sharply pointed out this problem for a long time, to call the whole party and the people throughout our country to be on their guard and to pay attention to correctly handling this problem. We should strictly enforce the discipline that governs our external economic activities and tell everyone who is engaged in external economic activities his obligation to observe discipline. If anyone violates this discipline, he will be punished in accordance with party discipline, administrative discipline and the laws of the state. We should intensify our education in patriotism and internationalism and teach all our party members, cadres and citizens to understand that in our contacts with the outside world we should resolutely oppose the corruption of capitalist ideology, safeguard our national dignity and national interests and maintain the prestige of our party and state.

China is implementing special policies and flexible measures in Guangdong and Fujian Provinces, and has also established in the two provinces four special economic zones, namely, Shenzhen, Zhuhai, Shantou and Xiamen. We should intensify our education and make the cadres and masses in these provinces, especially those in the special economic zones, really understand the true implications of the special policies and the flexible measures. What is special is special only when it is compared with what is unified, and what is flexible is flexible only when it is compared with what is in accordance with principle. Both specialty and unity and both flexibility and principle are related with one another. The special policies are adopted under the guidance of the unified national policy. Deviating from the four basic principles and the socialist orientation is not a part of the special policies but is called degeneration. Our flexible measures can play flexible roles only on the basis of firmly adhering to a principled stand. Casting away the communist stand, the party spirit and the party principles is not called a flexible way of doing things but is called capitulationism. This fundamental demarcation line must not be obscured. Through the development of our foreign economic relations, the special policies and flexible measures are primarily aimed at enabling us to do a better job of boldly promoting construction on our own initiative and under better conditions, and to improve product quality, production techniques and management for the sake of making new progress in two fields, namely, the management of economic construction and the development of foreign economic relations.

X. The Profound and Lasting Significance of Expanding Foreign Economic Relations

A major issue that our central leading comrades have been repeatedly mulling over is whether we will be able to achieve material successes in our socialist modernization within this century. We have confidence in this. However, taking our party as a whole, there are still some comrades who lack confidence and a small number of people even doubt it. Naturally, as yet no one can immediately foretell how great our material successes will be in our modernizations and one can only give a rough estimation. If we do our work well, we may achieve relatively great success, but if not, we will perhaps achieve only some small or medium successes. One of the critical issues here is whether we will be able to really open up bright prospects over the next few years.

It is not easy to open up bright prospects. During the initial period of the war of resistance [against Japan], Comrade Mao Zedong and Comrade Liu Shaoqi laid stress on opening up bright prospects. As Comrade Liu Shaoqi so rightly said, there is always a problem of opening up bright prospects during the period of a turning point. This is a historical truth. In the modern history of China, the Taiping Tianguo initially opened up bright prospects, but there was a change in the situation after it took Nanjing and the bright prospects were lost. When Doctor Sun Yat-sen led the revolution, the 1911 revolution opened up bright prospects, but this was brought to an end by his death. The tortuous course of our history tells us that all those who want to lead the historical trend and open up a bright prospect must first of all have a good insight and some courage and perseverance. Moreover they should also have a complete set of correct strategy and tactics. Otherwise, it will be impossible for them to open up bright prospects, and even once they have opened up some prospects, they will not be able to maintain the good situation and win final victory. On the contrary, they will often suffer defeats when victory is already in sight.

To open up bright prospects, our task in the economic field at present lies chiefly in the following four closely connected links:

First, bringing our agricultural potential into full play and particularly bringing about a great development of our diversified economy.

Second, bringing our industrial potential into full play and particularly achieving success in reorganizing enterprises at an early date.

Third, developing China's financial, monetary and commercial circulation in a more healthy way.

And fourth, relatively quickly developing our foreign economic relations.

If in the coming 20 years, we quadruple the scale of our foreign trade through developing our foreign economic activities, our total yearly trade volume will be 160 billion yuan. This figure appears tremendous, but it constitutes only 4 percent of the total yearly trade volume in the world at present.

Lu Zhi, an outstanding statesman and a man well known for his abilities in conducting financial transactions in the Tang dynasty, once said: "Losing a large amount of money because of begrudging a small expenditure, this is what a businessman will not do; and losing a bright future prospect because of pursuing immediate interests, this is what a man of common wisdom will not do." These words were well said. Our comrades who are engaged in economic work should be enlightened by these words. Businessmen who know how to do business, who are good at increasing sales by narrowing their profit margin and who really want to enliven their business will never act in the manner of losing a large amount of money because of begrudging a small expenditure. Even people of common wisdom can understand that it is wrong to give up one's future bright prospects in pursuing one's immediate interests. This means that we should be good at having a thorough understanding of the whole situation and at perceiving the future general direction of the development of things, thus we will have a strategic insight and will be free from shortsightedness.

Have we not always mentioned being of one heart and one mind? Being of one heart means that we should think the same way and being of one mind means that we should struggle together. As long as we really unite our strategic thinking and really coordinate our tactical actions and thus think the same way and struggle together, we will surely open up bright prospects. Of course, this takes time. In the future, we should seek to be of one heart by means of exchanging opinions and conducting investigation and study and we should seek to be of one mind through the practice of fighting together. In short, let us be of one heart and one mind in striving to open up bright prospects so as to develop the cause of socialist modernization of our motherland.

ON BOURGEOIS LIBERALIZATION AND OTHER ISSUES

Beijing RED FLAG in Chinese No 8, 16 Apr 82 pp 11-13

[Article by Hu Qiaomu]

> [Text] Editor's note: Issue No 23, 1981, of this magazine carried an article by Comrade Hu Qiaomu entitled "Some Present Problems on the Ideological Front." After the publication of this article, some constructive views and suggestions were received from readers on this discussion. Therefore, before the article's publication by the People's Publishing House, Comrade Hu Qiaomu made some amendments and additions to this article based on the views and suggestions of readers. In the amendments and additions, the expositions on the issues of bourgeois liberalization and of the criteria for appraising literary and art works are very important. At present, we are publishing them under the title "On Bourgeois Liberalization and Other Issues." The parts published here are based on the sequential order of the original article with captions and annotations added. The fourth part is not an amendment of the original article, but a new annotation added by the author.

1. On the Meaning of Bourgeois Liberalization

Here I would like to briefly discuss the meaning of bourgeois liberalization. Why do we call the social ideological tendency of opposing the four basic principles which exists in our society at present the ideological tendency of bourgeois liberalization? As everybody knows, the most important freedom under the capitalist system is the freedom of capitalists to carry out exploitation through the hiring of labor and the freedom of safeguarding bourgeois private ownership. This is the most essential point about bourbeois liberalization. The others include freedom of speech; publication, assembly, and association; freedom of election; and freedom for two or more parties to hold office in turn. In the final analysis, all these are derived from the above-mentioned important freedom and serve it. Moreover, this ideological tendency appearing in our society at present is characterized by energetically publicizing, advocating and seeking the freedom of the bourgeoisie and trying to apply the bourgeois parliamentary system, the two-party system, the election system, the bourgeois freedom of speech, publication, assembly and association, bourgeois individualism and nihilism to a certain extent, bourgeois profit-before-everything ideas and actions, bourgeois lifestyle and vulgar interests, bourgeois morals and artistic standards, bourgeois speculation and manipulation, graft and embezzlement, extortion and accepting of bribes, profiting at public expense, appropriating public property, and worshipping and fawning on the capitalist world to oppose our political, economic, social and cultural life, and negate, oppose and sabotage in principle China's socialist cause and negate, oppose and sabotage the leadership of the Chinese Communist Party over China's socialist cause. The social essence of this ideological tendency is to, consciously or unconsciously, try and break away from the socialist path and practice the so-called liberal trend of capitalism in the political, economic, social and cultural spheres. Therefore, we call it the ideological tendency of bourgeois liberalization. Clearly understanding and grasping the significance and characteristics of this ideological tendency will help us to guard against the misuse of this concept and help us to pay attention to drawing clearly some important lines of demarcation. For example, if a party member or a citizen criticizes a certain decision, a certain aspect of work or a certain responsible person of a certain party organization, he is exercising his legitimate democratic right and cannot be described as negating and opposing party leadership or as seeking bourgeois liberalization. Also, the academic freedom and literary creative freedom protected by our constitution and law are essential to the development of science and art, and these are completely different from the bourgeois liberalization mentioned here. No doubt it is necessary to properly solve the relations between collective planning and freedom of individual activity in scientific research organs and artistic undertakings and organizations, but generally speaking, this also does not involve the question of bourgeois liberalization. Conversely, if anyone really wants to negate, oppose and undermine the socialist cause of China; negate, oppose and undermine the leadership of the Chinese Communist Party over China's socialist cause or try to replace socialism and the whole socialist system with the liberal system of the bourgeoisie, we must wage a struggle against him no matter how he defends himself.

2. An Analysis of "Unrequited Love" and "The Sun and the Man"

The reason why we criticized the film script "Unrequited Love" and the movie "The Sun and the Man" based on it, is because they distorted the historical development of practical life in our society. Actually, they negated socialist China and the party leadership and propagated the "freedom" of the capitalist world. In both "Unrequited Love" and "The Sun and the Man," the author and the film's director made use of contrasts and spared no efforts to propagate the following view to the people: The "gang of four" represents the Chinese Communist Party and the 10 years of chaos means socialism. In socialist China, the Chinese people have not yet been emancipated and enjoy no freedom at all. What they display are ignorance and superstition. The party and the people have not won an historical victory in their struggle against the "gang of four." Therefore, there is not the slightest brightness and freedom in China and intellectuals deserve no better fate than persecution and humiliation. It seems that brightness and freedom only exist in the United States and the capitalist world, where the fate and freedom of life enjoyed by intellectuals are the admiration of everyone. Such a viewpoint is a typical manifestation of bourgeois liberal thinking. It is obvious that if we had failed to criticize "Unrequited Love" and "The Sun and the Man" and to educate people in our literary, art and ideological fields and the whole party through criticism so that they could enhance their capability to combat the tendency of bourgeois liberalization, it would have been difficult to maintain the socialist orientation of our literary and art cause and other causes.

3. On the Erroneous Tendency of Seeking Commercialization of Spiritual Products

In our socialist society, just as do material products, most of our spiritual products circulate as commodities. However, both the production of material and spiritual products should have the basic objective or satisfying the material and spiritual needs of the whole people. To attain this basic objective, our departments in charge of spiritual production should not only increase the quantity of the spiritual products, but do their best to enhance quality. In other words, we should make every effort to ensure that every spiritual product has patriotic, revolutionary and healthy ideological content and that it spiritually provides people with aesthetic enjoyment and inspires strength so that they will strive to make progress. At the same time, in spite of the fact that most spiritual products circulate as commodities, no spiritual product can break away from its spiritual objective and be blindly commercialized. In a word, the practice of "taking money as the be-all and end-all" is not allowed. If we depart from the basic objective of satisfying the needs of the people and blindly seek commercialization, we are liable to deviate from the basic principle of socialism. Then there would be no intrinsic difference between the spiritual production of our society and that of capitalist society. In capitalist society, both the production of material and spiritual products is highly commercialized and seeking profit is the sole objective. For the sake of making money, everything can be sold. Even the intuitive knowledge of man, personal influence, and living bodies of human beings can be "freely" sold as commodities. For the purpose of making profits, much spiritual production may unscrupulously produce various kinds of vulgar, philistine, decadent and reactionary spiritual products to corrode the spiritual world of the people basically without any interference. The commercialization and liberalization of such spiritual products is one of the basic reasons why spiritual crisis occurs and cannot be avoided in the capitalist society. At present, owing to shortcomings in their management systems and erroneous guiding ideology, some of our departments in charge of spiritual production, such as the press, editorial sections of publishing houses, and literary and art units have followed the erroneous tendencies of seeking the commercialization of spiritual products to a certain extent. They have defied the socialist principle of meeting the needs of the people who are engaged in modernization and failed to set high demands on publications and the ideological content of artistic activities. Instead, they "have taken money as the be-all and end-all" so that some spiritual products which surely exercise passive influence and corrode people's minds have prevailed in varying degrees. Some people even advocated that our publication and cultural undertakings should not be run by the state and society alone and that free management by individuals should be allowed. In the cultural field, such bourgeois liberal thinking and the spread of various erroneous viewpoints will play a role which cannot but encourage the spread of the tendency of bourgeois liberalization. This is a matter which merits our close attention and should be truly corrected.

4. On the Problem of Criteria for Evaluating Literary and Art Works

We should evaluate literary and art works from the two aspects--ideological content and artistic form. Generally speaking, the ideological content of literary and art works involve a number of things, including political, social, philosophical, historical, moral and artistic viewpoints, and so forth. Obviously, these viewpoints put forth in literary and art works are not abstract, but are connected with the truthfulness of life reflected by artistic images, subject matters, plots and art. Therefore, we demand that while evaluating the ideological content of a work, apart from analyzing its political views and tendencies, we should also analyze its ideological content in other respects and its understanding of the value of life. Only thus can we reflect the overall ideological content of the work. If we fail to do so, we are liable to regard literary and art works as the diagrams of certain political views. With regard to literary and art works with very strong political tendencies, their ideological contents should not be restricted to political tendencies alone, unless they do not possess the characteristics of literary and art works in general. Therefore, we should not reduce the ideological content of literary and art works to political viewpoints and tendencies alone (there is no doubt that revolutionary political viewpoints and political tendencies are absolutely important and necessary for a revolutionary writer). We should not take the political criterion in isolation as the first criterion for evaluating literary and art works. If we do so in a coercive fashion, we are liable to do things in an oversimplified and crude way in practice and obstruct literary and art creation and the healthy development of literary and art criticism.

A PROBE INTO A DEVELOPMENT STRATEGY FOR SOLVING THE FOOD PROBLEM--TALK ON EXPLOITING PROTEIN RESOURCES AND INCREASING THE UTILIZATION RATE OF PROTEIN

Beijing RED FLAG in Chinese No 8, 16 Apr 82 pp 14-19

[Article by Luo Jingba [5012 0513 2672]]

[Text] Editor's note: This is a good article well worth reading. It is clearly integrated, coherent and easy to understand. In the light of the research findings of many scientists of our country and the actual condition of our agriculture, the article expounds penetratingly with simple language the thesis that China must take the road of giving first priority to plant protein and at the same time appropriately developing animal protein so as to meet the nutritional requirements of 1 billion people.

Thousands upon thousands of comrades who do agricultural work and are related to agricultural production have too little knowledge of science on the one hand, and there is a lack of scientific and technical books which can quench people's thirst for knowledge on the other hand. Therefore, all of us have, in fact, a scanty knowledge of such questions as why a man must eat and what feasible methods we should take to further solve the problem of feeding a population of 1 billion. It seems to be a fantastic story which is hard to believe but which, in fact, is a living reality. In this way, how can blindness not emerge in our work? In order to get rid of blindness and enhance our consciousness, while earnestly implementing the various policies of the CCP Central Committee, we must attach great importance to the position and role of science and technology in our socialist modernization program and conscientiously study and master modern scientific and technical know-how. It is hoped that the departments concerned, particularly the planning and agricultural departments and food and feeding industrial departments and the related scientific research institutions will seriously consider and study the proposals put forth by the article.

People take food as everything. The problem of how to feed a population of 1 billion occupies a very important position in the development strategy for science and technology, the economy and society.

Eating meets the man's needs for nutrition. Man's needs for nutrition are diverse, but the most fundamental ones are for energy and protein. At present, 80 or 90 percent of these two kinds of nutrition needed by our inhabitants are derived from cereals.

According to a nationwide nutrition survey conducted by the health department and its affiliated organizations under the instruction of the State Scientific and Technological Commission in 1959 (Note: Since the 3d Plenary Session of the 11th CCP Central Committee, considerable improvements have been made in the nutrition of our people but the situation in which people lack protein has not changed fundamentally), every day every member of the urban and rural population absorbed on average 2,060 kilocalories of energy and 57 grams of protein. With regard to the nutritional situation at that time, the supply of calories was 10.4 percent less than the standard requirement and that of protein was 18.5 percent less. In the southeastern and southwestern regions of the country, the people's principal food is rice, so the protein content is less, constituting on average only about 60 percent of the standard required supply. It can thus be seen that in improving the people's nutrition, efforts should be made to solve the problem of protein. To this end, the writer of this article would like to discuss some of his tentative ideas on this problem.

The general method for the developed countries to solve the problem of protein requirements is to substantially expand grain crops and to use 60 to 70 percent of the output of cereals as fodder to develop animal husbandry. The average annual amount of grain per capita of countries such as the United States, Canada, Australia and Denmark is above 2,000 jin and that of the Soviet Union, Hungary, Romania and Yugoslavia is around 1,500 jin. Japan is an exception. When Japan began to vigorously develop animal husbandry in 1973, the average per capita amount of grain was only 400 jin and it mainly depended on imported fodder for a solution of this problem.

To reach the level of a per capita average of more than 1,500 jin of grain, there must be more cultivated land. Our country has a large population but limited cultivated land. Therefore, the development pattern of the developed countries does not suit China's national condition.

Since the 3d Plenary Session of the 11th CCP Central Committee, there have been substantial advances in China's agricultural production. Now every person has on average 650 jin of grain. In accordance with the suggestions of the Chinese Society of Physiological Science, to meet the needs of man's body for thermal energy, it is enough for every person to have on average 360 jin of processed grain a year. So, in terms of nutriology, it is not difficult to meet the needs of the whole population of the country for heat energy. The problem lies in the need for protein.

The Nutritive Value of Protein

The cell of all organisms consists of various kinds of protein. Engels pointed out: "Life is the mode of existence of proteins. This mode of existence lies, in essence, in the constant self-renewal of the chemical components of these proteins." ("Selected Works of Marx and Engels," Vol 3, p 120 Protein is the main constituent of the human body. The growth and the daily and hourly metabolism of human beings need to be continuously replenished by protein. The various kinds of protein are chemical compounds of macromolecule which are combined by more than 20 amino acids in accordance with a certain sequence of permutation and space structure. The protein in the human body can be resolved into various amino acids through the functions of various enzymes, and the human body again forms the amino acids into different proteins according to its different needs. There are eight amino acids that cannot be synthesized by the human body; they must be absorbed directly from food. These amino acids are called essential amino acids; they are methionine, lysine, leucine, isoleucine, phenylalanine, theonine, trytophan and valine. The remaining amino acids that can be synthesized by the human body itself are not the essential amino acids in food. The human body forms the protein of the human body in a way that takes a kind of amino acid with the least content as the basic point and absorbs the various remaining amino acids in proportion. Therefore, a so-called nutritional balance is in fact a kind of "short-line balance," that is, of these eight amino acids, any one which has insufficient content will interfere with the full utilization of the remaining amino acids. These incomplete sets of amino acids cannot be formed into the protein of the human body but can only produce thermal energy. They are wasted, so to speak. Therefore, of the edible proteins, whether the proportion of the content of various amino acids is coordinated is a very important problem. The nutritive value of the proteins whose various amino acids are in proportion is high and that of the proteins whose various amino acids are in disproportion is not high. Therefore, in terms of modern nutriology, there is both the question of quantity and quality in the need of the human body for protein. Generally speaking, every person needs on average more than 70 grams of protein a day. This is a quantitative index. Along with this, the eight essential amino acids contained in these proteins must be in a certain proportion and the proportion of any one of them cannot be too little, that is, the nutritive value must be complete. This is a qualitative index. Protein from animal sources generally contains the eight amino acids needed by the human body, and particularly eggs and milk, in which the proportion of the eight amino acids is coordinated, provide complete nutrition. This is the fundamental reason why many developed countries attach importance to developing animal husbandry to solve the problem of edible protein.

Exploit Protein Resources and Increase the Utilization Rate of Protein

In considering solutions to the problem of the need of our people for protein, it is necessary to give consideration to both quality and quantity and to try by every conceivable means to exploit protein resources and increase the utilization rate of protein.

Raise the protein content of cereals and vegetables. Raising the protein content of cereals through breeding work will help substantially improve the protein content of cereals and the nutritional level of cereals in terms of the quantity of protein. Take wheat for example. The protein content of wheat in the areas north of the Huanghe River is about 13 percent and that in the Changjiang River basin is 10 to 12 percent. The protein content of the commodity wheat of the United States and Canada is, on the whole, 15 percent and the protein content of some new varieties that have started to be popularized is 17 to 18 percent. In England, the protein content of the latest experimental variety of wheat is 25 percent. It can thus be seen that the potential for raising the protein content of cereals is fairly large. In the past, in our breeding work, one-sided emphasis was put on output targets at the expense of the nutritive value of crops and of whether the crops suited the people's tastes. In the future, more attention must be paid to the nutritive value of any new variety and to making a quantitative anslysis, and especially making an analysis of the protein content and the composition of amino acids. This requires that agricultural scientific research departments and educational departments enhance the building of a specialized profession of nutrition.

With regard to the food structure of our inhabitants, vegetables are second only to cereals. By and large, the protein content of vegetables is not high, but the protein content of fresh mushrooms is about 3.5 percent, much higher than that of common vegetables (the protein content of Beijing cabbage is 1.1 percent and that of radishes is 0.6 percent). In the process of growth, mushrooms can use the cellulose of plant straws and seed shells for nutrition. None of these things can be digested and absorbed directly by the human body. Therefore, culturing mushrooms by using wood-wool, cottonseed shell and cow dung as a culture medium is an important way to increase the sources of protein. At present, the world annual output of mushrooms is over 1 million tons. In the United States, some people predict that fungus food will become one of the main foodstuffs in the 21st century. Many units in the cities of our country have begun to produce various edible fungi. The annual output of edible fungi of Fujian Province is 40,000 tons and that of Shanghai is 6,000 tons. They are mainly for export. The culturing of mushrooms must be done under certain conditions, but it requires comparatively little investment and promises fairly quick results. It is a kind of labor-intensive and intellect-intensive production, and is in a position to provide jobs for quite a few youths waiting for employment. Some people say it is a kind of "urban agriculture" which has a great future. The underground civil defense projects in many cities of our country can be used for producing mushrooms. However, at present the output of the culturing of mushrooms is not high and the production costs are relatively expensive. This problem needs to be solved through scientific research.

In developing a diversified economy in the rural areas, it is imperative to make the exploitation of protein resources as an important goal. Special attention should be devoted to the utilization of hills, lakes and ponds as well as sea mud and to the planting and gathering of crops and fruits which have a rich protein content, such as Chinese chestnut, walnut, oil-tea camellia, mudou [2606 6258], shiny-leaved yellowhorn, olive, water caltrop and kelp. Most of the seeds of oil-bearing crops have both a high fat and a high protein content. Developing these plants will provide people with the most needed protein and fats. This can kill two birds with one stone. Particular importance should be attached to it.

Revive the acreage planted to soybeans and develop the soybean food industry. Soybeans contain about 40 percent protein and around 20 percent fat. Of the amino acids in the protein of soybeans, besides the fact that the methionine content is relatively poor, the content of the remaining essential amino acids is relatively high. Therefore, soybean is a grain crop with high protein and high fat content, and is a crop which has a relatively complete nutritive structure.

Our country was the origin of soybeans and is called "the land of soybeans." China's acreage under soybeans in the 1930's totaled 220 million mu. Both the output and export volume of soybeans constituted 90 percent of the world total. This figure began to decline in the 1940's but gradually increased after the founding of the PRC. The soybean output in 1956 was 20.4 billion jin and the acreage under soybeans in 1957 was revived to 190 million mu. However, by the 1960's and 1970's, as the result of one-sidedly concentrating on grain output and denouncing soybeans as a "low-yielding crop," the acreage under soybeans and the soybean output had dropped by a big margin. The acreage under soybeans dropped to a minimum level of 100 million mu and the minimum annual output was 14 billion jin. Besides, precisely at this time, the world output of soybeans increased far more rapidly than that of other grain crops. The total world soybean output in 1949 was only 24.8 billion jin, but by 1979 it had increased to 188.3 billion jin, an increase of 6.6 times over the 1949 figure. The soybean output of the United States in the same period increased by 9.7 times and its acreage under soybeans rose from several million mu to 440 million mu, constituting over 14 percent of the acreage under grain crops, and its total output was 121.7 billion jin. Brazil began to import soybean seeds from our country in 1960. In 1970, its acreage under soybeans was no more than 20 million mu and its annual output was 3.1 billion jin, but in 1977 its acreage under soybeans was developed to 100 million mu and its annual output was 25 billion jin, thus becoming the second largest soybean-producing country in the world.

Is soybean really a "low-yield crop"? Calculated in terms of output alone, the output of soybeans is really lower than that of other grain crops (for instance, in 1980 the average per mu yield of paddy rice was 550 jin; that of corn, 410 jin; that of wheat, 250 jin; and that of soybeans, 146 jin). However, judged from the point of view of nutriology and economic results, soybeans can by no means be called a low-yield crop. Compared with soybeans, the protein content of corn is usually around 8 percent. The protein of 1 jin of soybean is equal to the protein of 5 jin of corn, and furthermore the quality of soybean protein is far superior to that of corn. According to the calculations of scientists, the application of every 1,000 kilocalories of energy to 1 mu of land sown with corn will achieve an additional increase of 2.69 kilograms, and the application of the same quantity of energy to soybean production will achieve an additional increase of 1.43 kilograms. The increased amount of soybeans is not as large as that of corn but, calculated in terms of protein content, the protein content of corn is only 215 grams while that of soybeans is 514.8 grams. The protein content of soybeans is substantially higher than that of corn. According to data of the United States, the beef provided by 1 hectare of land sown with fodder grass can only meet the protein requirements of one person for 77 days; that provided by 1 hectare of land sown with wheat, for 877 days; and that provided by 1 hectare of land sown with soybeans, for 2,224 days. There is a lack of protein in our people's nutrition, so more importance must be attached to soybean production. For this purpose, we propose that before 1985, China's acreage under soybeans be restored to the level of the 1960's, that is, 150 million mu, and that by 1990, to the level of the 1950's, namely, 200 million mu, comprising about 10 percent of the acreage under grain crops. China has always attached adequate importance to the planting of grain crops rather than soybeans. The cultivation of soybeans has been invariably extensive. Therefore, the potential for increasing the yield per unit area is enormous. At present the average world per mu yield of soybeans is 200 jin. If we can reach this level by 1990 through ameliorating varieties and improving cropping techniques, then our country will be able to produce 40 billion jin annually and to reach an average of 37 jin per person, the level we attained in the 1950's. China's commodity base of soybeans is in the northeast. There is still enormous potential for increasing production there. Soybean is a hydrophilous crop. There are bright prospects for rotating soybeans with corn, cotton and other crops in the Huanghe River and Huaihe River basins; for interplanting soybeans with dry crops, such as corn and tea, in the south and for dibbling soybeans in parcels of land scattered around fields. This will both boost production and improve the soil through the fixation of nitrogen resulting from soybean root-nodule bacteria, thus contributing to putting an end to the decline of soil fertility. Therefore, gradually restoring and developing soybean production is an important measure for achieving many things at one stroke.

China has a fine tradition of processing soybeans. It has more than 100 varieties of bean products and fermented bean products. Most of them are conducive to raising the nutritional value of soybeans. At present a "craze for bean curd" has arisen in the United States and other countries in the West, a craze in which people like to eat Chinese-style bean products. Over the last few years, along with the advances in food-processing techniques and under the influence of modern nutriology, some countries, such as the United States, have been substantially developing the production of soybean protein. For example, there are nonfat soybean protein, enriched soybean protein, separated soybean protein, tissue soybean protein and others. Apart from the nutritive structure of soybeans, such as the inhibitor of trypsin, haemagglutinin, saponin, and gas-producing factors of intestines and stomach, these processed products increase nutritive value. They are widely mixed into meat, drinks, bread and refreshment products, artificial cream and other foodstuffs. According to statistics, at present in the world there are more than 12,670 kinds of foodstuffs which contain soybean protein. In the United States, every year 1.4 million tons of soybean protein are added to 16 kinds of foodstuffs. In order to raise the nutritive value of soybeans, we must carry on the traditional processing technology of soybeans and at the same time vigorously develop the soybean food industry.

Nearly half of the 15 billion jin of soybeans China now produces every year is used for extracting soybean oil. In the past, large quantities of soybean protein, which could have been digested by man and animals, became compounds which could not be digested and absorbed because of the improper use of heating in the process of extracting oil both by indigenous methods and machines. There were similar cases in the process of extracting oil from peanuts, cottonseed, rapeseed and others. This was a great waste of protein resources. It is necessary to be resolute in transforming our fat industry and to adopt advanced dipping processes, and while extracting fat we must try our best not to destroy protein. There are some problems calling for further study and solution in the choice of solvents, precipitation, deodorization and other processing techniques. In our country at present, most of the bean dregs left over after extracting oil are used as fodder. It is imperative to find new ways to use some of them directly as raw materials for producing foodstuffs, such as synthetic meat, bean powder, bean curd, and salted and fermented soy paste.

Revive and develop compound foods, such as mixed-grain flour, nutritious bread and fortified food. As we mentioned above, the nutritive value of protein is determined by whether the amino acids of which it is composed are in proportion. At present the main sources of protein for our people are cereals. In accordance with the principle of "short-line balance," in the protein of cereals, the lysine content is exceedingly scarce, which affects the role of the remaining amino acids. Lysine became the first amino acid which restricted the nutritive value of cereal protein. The recent experiment of the Nanning Maternity and Child Care Hospital in Guangxi shows that food mixed with two permils of lysine resulted in marked improvements in children's weight, height and health conditions compared with the control group in the experiment. It is known to all that in soybean protein, lysine is relatively plentiful. Mixing a certain amount of soybean powder into corn by utilizing the principle of nutrients complementing each other can raise nutritive value. People in the north have the habit of using mixed-grain flour. We must adopt measures to revive this tradition in grain processing. This is the most practical and effective way to increase the utilization ratio of plant protein. In our country the nutritive value of the composition of mixed-grain flour is as follows:

	Mixed flour I	Mixed flour II	Mixed flour III
Kaoliang (nutritive value of protein: 56)	30%		
Corn (nutritive value of protein: 60)	50%	75%	40%
Millet (nutritive value of protein: 57)			40%
Soybean (nutritive value of protein: 65)	20%	25%	20%
Nutritive value of protein of mixed-grain flour	75	76	83

Although the nutritive value of soybean protein is relatively high, the methionine content of soybean protein is still relatively low compared with animal protein and the protein from milk resources. Therefore, to bring into full play the nutritive value of such plant proteins as soybean, it is necessary to add a certain amount of methionine. Modern science enables the synthesis of the eight essential amino acids through biological methods such as fermentation and chemical synthetic methods. China's problem of producing these amino acids for medical use has now been basically solved. China has experimental factories with a total production capacity of 3,000 tons of edible lysine and lysine for fodder per year. However, other problems, such as the purification of these amino acids, have not been completely solved. Methionine has been produced on a small scale, but its price is nearly 10 times higher than that of imported methionine. We hope that the state will organize its forces to tackle key problems in scientific research in this respect and be determined to promptly set up several big factories each with an annual 10,000-ton plus production capacity in the period of the seventh 5-year plan. By so doing, we can substantially raise the nutritive value of our existing plant protein. This would be a major step in solving the problem of feeding a population of 1 billion. It needs an investment of only several hundred million yuan but promises fairly great economic returns. So we must make early preparations for it.

Develop the feed industry and improve the level of production of animal husbandry. According to study and research, the portion of solar energy transferred and utilized by crops in the process of their growth which can be directly utilized by the human body is only about 25 percent. It is only through animal husbandry that the remaining 75 percent (straw, stems and leaves as well as bran and others) can be transformed into animal protein, fat and so forth which can be utilized by the human body (of these materials, such as straw as well as stems and leaves, which constitute the 75 percent of energy, animals can digest and utilize only 25 percent and a considerable part of the remaining 75 percent becomes organic fertilizer which will become useful material to the human body through transformation by plants). This is the fundamental reason why we must give equal priority to both agriculture and animal husbandry and make strenuous efforts to develop animal husbandry.

In developing animal husbandry, it is necessary to pay attention to nutriology. The needs of animals for nutrition are the same as humans, that is, mainly energy and protein. Energy fodder and protein fodder constitute the principal part of fodder. Judged by a comprehensive survey of our fodder supplies, in the past importance was attached one-sidedly to the supply of energy at the expense of the supply of protein. The failure to ensure a proportionate supply of protein made animals unable to fully utilize the energy provided and thus resulted in the high "ratio between fodder and meat" (that is, several jin of fodder producing 1 jin of meat) in China's animal husbandry. High costs interfered with its development. For instance, in the past, in breeding pigs, we one-sidedly concentrated on the amount of grain and green fodder used for feeding pigs, but neglected the amount of energy and protein contained in the grain and green fodder and the proper proportion between the two. In the 1960's and 1970's, for a while we went in for saccharified pig feed in a big way, but there remained the problem of energy fodder. One of the important reasons why our pigs provide more fat meat rather than lean meat is, apart from the factor of the breed of pig, that we have insufficient protein fodder.

In order to give full play to the role of fodder grain and green fodder, it is necessary to try in every possible way to exploit protein fodder resources and to enthusiastically develop mixed feed, compound feed and whole feed. Such being the case, we must develop the feed industry in a planned and vigorous way in the light of local conditions. This is the road we should follow in accelerating the development of animal husbandry and increasing its economic return.

How should protein fodder resources be exploited? There is a lot we can do in this respect. They are mainly as follows:

1. Fully utilize various existing cakes and dregs. Our fat industry produces nearly 20 billion jin of various cakes and dregs a year, some of which generally contain 20 to 50 percent protein. However, at present more than half of the cakes, such as rapeseed, peanut and cottonseed cakes, are used directly as manure. In our country, it is impossible to completely refrain from using the various cakes and dregs as manure for the time being, because some cake fertilizers must still be applied to some industrial crops. However, it must be realized that by not first using most of the cakes and dregs as feed and then using the waste of poultry and livestock as manure we are wasting protein resources. We must gradually change this situation and strive to make more cakes and dregs than we have at the moment so that they become a source of protein feed in the feed industry through simple detoxification processes.

2. Make full use of leftover bits and pieces, such as animal blood, flesh, bones, skin and pupas, from the meat-processing factories, slaughterhouses, fish-processing stations, and filatures of the cities and the countryside and turn them into various kinds of protein powder through processing.

3. Make use of industrial liquid waste and waste heat to develop unicellular fodder protein from fodder yeasts and nitrogen-fixing blue-green algae.

4. Produce lysine, methionine and various fodder vitamins and biotins and use them as the nutritive additives of feed so as to increase the utilization ratio of various kinds of protein of the feed industry.

5. Strengthen the study of mycelial protein, which uses petroleum and natural gas as raw materials, and develop the petroleum protein industry step by step.

Conclusion

To sum up, we should take the road of giving first priority to the development of plant protein and at the same time developing animal protein. This is a development strategy for solving the food problem, a strategy which suits China's national condition.

The road of giving priority to the development of animal protein which is being taken by the developed countries is in fact a road of using plant protein as feed to meet the nutritional requirements of human beings through the intermediary of transformation by livestock and poultry. This intermediary transformation is fairly inefficient (Note: According to study and research, the transformation rate of pigs is 18.3 percent; that of cows, 12.1 percent; that of milch cows, 25.3 percent; that of layers, 21 percent. That is to say, out of every 100 jin of plant protein, only about 20 jin can be transformed into animal protein and the remaining 80 percent can be used only as manure) and causes a lot of waste. This should not be taken as a model by our country, a country which has a large population but limited usable land.
